2330. Schaible, Todd, D. & Jacobs, Alfred. (Rappahannock-Rapidan Mental Health-Mental Retardation Services Board, Culpeper, VA) **Feedback III: Sequence effects: Enhancement of feedback acceptance and group attractiveness by manipulation of the sequence and valence of feedback.** *Small Group Behavior*, 1975(May), Vol 6(2), 151-173.—Compared 4 sequences of positive and negative feedback and measured the effect of sequence and desirability of feedback, and on Ss' perception of group attractiveness. 60 female undergraduates were assigned to 5-member groups which performed 2 consensus-seeking exercises. Positive or negative feedback was given after each exercise, in varying order. An acceptance-desirability rating scale and a small group attractiveness questionnaire were then administered. Feedback in general was perceived as more acceptable and desirable ($p < .001$) than negative feedback. Positive feedback was seen as less acceptable when given on Occasion 2 than Occasion 1. Negative feedback was rated as more acceptable and more desirable on Occasion 2 than Occasion 1. Also, there was significant interaction between valence of feedback and sequence. Finally, the positive-to-negative sequence generated greater group attractiveness ($p < .001$). (28 ref)—J. Rubin.

2331. Schwarzwald, Joseph. (U Texas, Austin) **Constructive criticism and positive evaluation as determinants of interpersonal attraction.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2770.

2334. Shapira, Ariella & Lomranz, Jacob. (Tel-Aviv U, Israel) **The kibbutz: Growing up in a society of peers.** *Psychology*, 1975(May), Vol 12(2), 53-64.—Considers the kibbutz as a place to study the relationship between socialization and personality in a complete small-scale society without many of the problems associated with subgroup research. Aspects of kibbutz life described include growing up in a communal society, the peer group as a socializing agent, and the process of multiple mothering. 2 views of the personality development of the "kibbutznik" are presented: those of A. I. Rabin (1965) and B. Bettelheim (1969). The appropriateness of using E. H. Erikson's (1969) developmental stages to describe the kibbutz culture is questioned.—R. Tomasko.

2335. Shapiro, Rodney J. & Klein, Robert H. (U Rochester, Medical School) **Perceptions of the leaders in an encounter group.** *Small Group Behavior*, 1975(May), Vol 6(2), 238-248.—Attempted to determine whether an encounter group increases the accuracy with which group members perceived others (i.e., the group leaders), and whether perception of the leaders was related to each person's personality. Ss were 11 administrators of a regional health planning service. After an initial group introduction, the members and 2 leaders were administered the 16 PF. Group members also completed a rating scale, compiled from the 16 PF, rating their perceptions of the leaders. After the 2-day group, members completed another set of leader rating scales. Accuracy was defined as the correspondence between members' ratings of leaders with leaders' self-ratings. Results indicate that group members' perceptions bore almost no relationship with leaders' self-ratings, interpreted as low accuracy of perception. On the 1st leader rating scale group members perceived the leaders as being less similar to each other than the leaders saw themselves. However, on the post-group rating scale, members saw the leaders as more similar to each other than the leaders perceived themselves. A composite group personality profile of the leaders was highly similar to leaders' self-perceptions. (18 ref) J. Rubin.

2336. Skriptka, P. (U Charles, Faculty of Physical Education & Sport, Prague, Czechoslovakia) **Interpersonal behaviour and sports group effectiveness.** *International Journal of Sport Psychology*, 1975, Vol 6(1), 14-27.—Discusses the basic group phenomenon of interpersonal relations, and its influence on the performance of the subgroups of a group, and thus on the effectiveness of the whole group. Discussion is based on the results of the studies of 10 groups, and thus on the results of the questionnaires and experimental games. Results show that friendly interpersonal relations (sympathy, liking, respect, etc.) have a positive influence on the performance of the subgroups and thus on the effectiveness of the whole group. (15 ref)

Journal of Sport Psychology

2337. Weinstein, Malcolm S. & Hanson, Robert. (York U, Toronto, Canada) **Leader experience level and patterns of participation in sensitivity training groups.** *Small Group Behavior*, 1975(May), Vol 6(2), 123-140.—Compared participation patterns of sensitivity group leaders differing in experience level, and their influence on patterns of overall group participation. More experienced leaders were expected to differ from less experienced leaders on amount and range of verbal interaction they initiated and received, and interpersonal efficiency ratios. 8 male and 10 female undergraduates were randomly assigned to "here and now" discussion groups led by a male-female pair of leaders. Interaction was coded, fed into a computer, and summarized in an interaction matrix. For amount of verbal interaction, the only significant difference between leaders was that the more experienced leaders were more consistent over sessions than the less experienced leaders. For range of verbal interaction, no significant differences were found. For the received-to-initiated ratio of interaction (R/I), less experienced leaders had significantly higher R/I's than more experienced leaders. There were significant differences within the more experienced leader groups on R/I's. (20 ref)—*J. Rubin*.

2338. Williams, J. Sherwood; Martin, J. David & Gray, Louis N. (Virginia Commonwealth U) **Norm formation or conditioning? A study in divergence.** *Small Group Behavior*, 1975(May), Vol 6(2), 141-150.—Replicated the M. Sherif's (1965) study which showed that Ss' autokinetic judgments converged when discussed in a group, indicating that internalization had occurred. In the present study, it was hypothesized that with time, Ss' judgments would rediverge. 3 sets of 30 cards containing complex geometric figures were used as experimental stimuli. Ss were to estimate how many isosceles triangles were on each card. On the 1st set, Ss judged individually. On the 2nd set, Ss judged aloud in triads. On the 3rd, Ss judged alone. Results indicate that convergence of judgments had occurred in the 2nd set ($p < .05$). Thus, the convergence was interpreted as temporary norm-formation rather than internalization. (30 ref)—*J. Rubin*.

Social Perception & Motivation

2339. Apfelbaum, Erika & Personnaz, Bernard. (U Paris VII, Lab de Psychologie Sociale, France) **[Inequality, conflict, and negotiation: An experience "pour voir."]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 778-783.—Briefly reports an experimental study of the effects of Ss' perceived positions of inequality on their responses to an experimental task (an adaptation of the Prisoner's Dilemma game). Effects on performance of variance among 4 independent variables (sex, initial position of inequality, amplitude of inequality, and external options for reducing inequality) were analyzed. Data analyses point to the existence of diverse dimensions of inequality which, when studied in relation to Ss' responses to conflict and negotiation, are not necessarily levels on an "inequality" continuum but appear to represent heterogeneous influences on habit and should be studied as such. *Z. M. Cantwell*.

2342. Cottrell, Nicholas B. (U Iowa) **Heider's structural balance principle as a conceptual rule** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 713-720.—Conducted 2 experiments to examine the hypothesis that F. Heider's (1958) balance principle is a prominent conceptual rule when individuals classify social situations. A total of 172 Ss (mostly college students) classified descriptions of triadic social situations in the standard reception paradigm for studying conceptual behavior. Supporting the hypothesis, results show that Ss required to use the balance rule performed better ($p < .01$) than a rote-learning control group. The balance rule was more available than other rules that involve 3 relevant dimensions ($p < .00001$). The balance rule was significantly less available than rules based on friendship or agreement in the situation. These findings are discussed in terms of number of relevant dimensions as a determinant of problem difficulty, positive intraproblem transfer resulting from previous rule use, and variability of the mediating response as a determinant of rule availability.—*Journal abstract*.

2344. Deaton, Lewis C. (Temple U) **Confidence about one's perceptions of significant others: A study of person perception in T-groups.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1697.

2345. Donnerwerth, Gregory V. & Törnblom, Kjell Y. (Memphis State U) **Reactions to three types of distributive injustice.** *Human Relations*, 1975, Vol 28(5), 407-429.—Reexamines distributive justice or equity theory and concludes that existing formulations account for only a small number of possible types. A schematic outline is provided of main types, subtypes, minor types, and auxiliary types of justice-injustice situations. 2 studies (1 cognitive and 1 experimental) tested the hypothesis that individuals would differentially define and respond to previously unrecognized injustice states. Positive results confirm the hypothesis and the existence of more specific subcategories of injustice. Study 1 confirmed the hypothesis of perceived differences in intensity of injustice, while the behavior of Ss in Study 2 did not conform to predictions. This discrepancy is discussed in terms of the preference of female Ss for accommodative rather than competitive behavior, or alternatively, that persons in a direct exchange situation seek to maintain harmony between themselves and others. (28 ref)—*W. W. Meissner*.

2346. Eiser, J. Richard & White, Camilla J. (U Bristol, England) **Categorization and congruity in attitudinal judgment.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 769-775.—Studied the effects of judges' attitudes, a superimposed classification, and connotations of the response language on judgments of attitude statements. 108 male and 108 female 12-13 yr olds rated the favorability of 10 statements toward adult

authority along 8 scales. *Anti* Ss gave more polarized ratings (narrower unit) along 4 scales where the *anti* term was evaluatively positive and the *pro* term negative than on 4 scales where the *pro* term was the more positive; this difference was reversed for *pro* Ss. Also, on 4 ("marked") scales, the *anti* term was seen as more masculine in connotation than the *pro* term, whereas on 4 ("unmarked") scales the terms carried no connotation of masculinity or femininity. When Ss were told that the 5 *anti* statements had been made by boys and the 5 *pro* statements by girls, Ss showed an accentuation of the judged differences between the 2 groups of statements on both marked and unmarked scales compared with Ss who were given no such information about the source of the statements. A similar accentuation effect was shown on unmarked scales only by Ss who were told that the *pro* statements had been made by boys and the *anti* statements by girls. It is concluded that the effect of a peripheral attribute on judgment depends on its congruity with connotations of the response language. (17 ref) —*Journal abstract.*

2347. Gifford, Robert K. Information properties of descriptive words. *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 727-734.—Conducted 2 experiments with a total of 95 female college students to examine some of the dimensions of information conveyed by descriptive words. In Exp I Ss rated descriptive terms on each of 15 scales. The terms rated were either personality traits or life conditions. For each of these types of descriptive terms, the intercorrelations among scale ratings were factor analyzed. In each case, a 5-factor solution yielded an interpretable set of dimensions which represented information properties of the rated terms. In Exp II Ss made judgments about stimulus persons described by terms that had been rated in Exp I. Factor scores for these terms varied along one of the trait dimensions from Exp I or (for life conditions) along 2 of the life condition dimensions. Results demonstrate that the kinds of judgments made about a person are related to the factor scores of the terms used to describe him. (15 ref)—*Journal abstract.*

2348. Gonzalez-Tamayo, E. Dogmatism, self-acceptance, and acceptance of others among Spanish and American students. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2765.

2349. Green, Russell G.; Stonner, David & Shope, Gary L. (U Missouri, Columbia) The facilitation of aggression by aggression: Evidence against the catharsis hypothesis. *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 721-726.—90 male college students were either attacked or treated in a more neutral manner by a male confederate. On a subsequent maze-learning task, 30 Ss shocked the confederate, 30 observed as the E shocked the confederate, and 30 waited for a period of time during which the confederate was not shocked. Finally, all Ss shocked the confederate as part of a code-learning task. Ss who had been attacked and had shocked the confederate during the maze task delivered shocks of greater intensity on the code task than did Ss in the other 2 conditions, and the former Ss also experienced a greater reduction in diastolic blood pressure than did the latter. Results contradict the hypothesis of aggression catharsis and are discussed in

terms of feelings of restraint against aggressing that an S experiences after committing an aggressive act. (19 ref) —*Journal abstract.*

2350. Hendrick, Clyde & Giesen, Martin. (Kent State U) Effects of task success or failure on causal attributions and person perception. *Memory & Cognition*, 1975(Jul), Vol 3(4), 363-369.—An actor's outcome on a task (success-failure) was manipulated orthogonally to information that the actor either used or did not use drugs. Causal attributions for success-failure were obtained as well as trait ratings of the actor, 286 undergraduates read a case study of an artist who either succeeded or failed in his profession. For half of the Ss, the artist was described as using hard drugs; no mention of drugs was made for the other half. It was predicted and confirmed that success-failure interacted with drugs—no drugs in determining attributions of ability. Success tended to be internally attributed to the actor, while failure was externally attributed. The interaction obtained for ability attribution was not obtained for a measure of trying nor for the trait ratings. Results confirm E. J. Kepka and P. Brickman's (see PA, Vol 47:6717) suggestion that ability and motivation are qualitatively different concepts in naive psychology, but some of their specific conclusions are questioned. —*Journal abstract.*

2351. Kaplan, Martin F. (Northern Illinois U) Evaluative judgments are based on evaluative information: Evidence against meaning change in evaluative context effects. *Memory & Cognition*, 1975(Jul), Vol 3(4), 375-380. Notes that trait adjectives commonly employed in person perception studies have both evaluative and denotative meanings. Evaluative ratings of single traits shift with variations in the context of other traits ascribed to the stimulus person; the extent to which denotative changes underlie these evaluative context effects has been a theoretical controversy. In Exp I with 43 undergraduates, it was shown that context effects on quantitative ratings of denotation can be largely accounted for by evaluative halo effects. In Exp II with 40 Ss, increasing the denotative relatedness of context traits to the test trait did not increase the effect of the context. Only the evaluative meaning of the context affected evaluation of the rated test trait. These studies suggest that the denotative relationship between a test adjective and its context has little influence on context effects in person perception, and that denotative meaning changes do not mediate context effects. Instead, evaluative judgments appear to be based on evaluative meaning. (20 ref)—*Journal abstract.*

2352. Kelman, Herbert C. (Harvard U) Attitudes are alive and well and gainfully employed in the sphere of action. *American Psychologist*, 1974(May), Vol 29(5), 310-324. Views attitudes as a central concept in social behavior. 2 types of empirical research are examined as the basis for questioning the validity and usefulness of the attitude concept: studies of attitude-action consistency and studies of the effects of counterattitudinal action. Neither are seen as decisive. A conception of attitudes as embedded in an action context is presented. Attitude is not an index of action, but a determinant component, and consequent of it. Attitude and action

are linked in a continuing reciprocal process. (36 ref) —R. Tomasko.

2353. Santi, Angelo & Wells, Roger. (Carleton U, Ottawa, Canada) **Strategy choices in three variants of a threat-vulnerable game.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 776-786.—180 male college students were involved in 1 of 3 variants of a threat-vulnerable game for 125 trials under 1 of 3 communication conditions: forced, optional, or no communication. Results indicate that as the row player's threat to the column player increased row's propensity to select his nondominant strategy increased. Total payoff to the row player was inversely related to the amount of threat contained in the payoff matrix. Also, the average total payoff to row player was greater when communicative opportunities were available than when they were not. The stochastic measures revealed that as row's threat to column increased, row's propensities of revolt and persistence and column's propensity of appeasement increased. This finding suggests that column players may be reinforcing what they consider to be desirable behavior by row player. The failure of communication to significantly affect game behavior is interpreted as a schedule effect and is supported by a review of the relevant gaming literature. (31 ref)—*Journal abstract*.

2354. Shirakashi, Sanshiro & Yoshida, Michio. (Seinan Gakuin U, Div of Commerce, Fukuoka, Japan) **The effects of success vs. failure and leader's LPC on member reactions.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Mar), Vol 18(1), 22-29.—Conducted an experiment with 86 female Japanese high school students to study the effects of leaders' least preferred co-worker (LPC) scale (F. E. Fiedler) score and success vs failure on the responses of group members. Each experimental group had 4 members and was asked to discuss some adolescent problem behavior cases. The condition of success vs failure was manipulated by false feedback from the E, and the "leader" of the group was identified, postdiscussion, by a questionnaire. Group members under high LPC leaders described their own group atmosphere as more favorable and were more satisfied with the information given in the success than in the failure condition. These differences were not found for the members under low LPC leaders. (18 ref) —*Journal abstract*.

2355. Sinha, L. N. & Sinha, R. C. (Patna U, Inst of Psychological Research & Service, India) **Halo effect in reciprocal evaluations by male and female college students.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 32-34.—Studied the difference in attribution of characteristics by male and female college students to their own sex members and to the members of the opposite sex and explored the relative bias in trait attribution. 80 male and 83 female university students completed the authors' interpersonal evaluation schedule. Results indicate that both male and female Ss attributed a significantly greater number of desirable characteristics to their own sex members. Males assigned equal numbers of desirable and undesirable characteristics to females, while females endorsed a significantly greater number of desirable characteristics to males. Males showed relatively more bias in favor of their own sex members than did females.—*Journal abstract*.

2356. Smith, J. L. (MRC Social & Applied Psychology Unit, U Sheffield, England) **A games analysis for attitude change: Use of role enactment situations for model development.** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 63-79.—Presents a games analogy regarded as the 1st step in the development of an agonistic model for attitude change. The analogy is designed to cover situations involving verbal interaction between 2 people not holding the same attitude. A measure, called a scale of preference (SoP) is described, which is an order of values on which the quality of an evaluated item can be located. Attitude games and the major strategies available to players are described, and ways in which the games analysis can be used to conduct empirical investigations of attitude change are suggested. An illustrative exploratory study, using the methodology and SoP scales, is appended.—R. Tomasko.

2357. Smith, R. Bob. (State U New York, Albany) **Initial impressions and expectations for behavior in beneficial and harmful situations.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2029-2030.

PERSONALITY

2359. Alston, William P. (Rutgers State U, Douglass Coll) **Traits, consistency and conceptual alternatives for personality theory.** *Journal for the Theory of Social Behaviour*, 1975(Apr), Vol 5(1), 17-48.—Discusses ways of choosing between basic conceptual alternatives for personality description. Indeterminancies in recent controversies over the nature of traits are identified and the literature reviewed. A purposive-cognitive theory of motivation is described in which all intentional action is related to particular goals, using 3 basic inner psychological determinants: desires, beliefs, and abilities. This theory is contrasted with the concepts of W. Mischel (1968, 1973) and with an alternative situation-response theory of motivation. (15 ref)—R. Tomasko.

2360. Arasteh, A. Reza. (George Washington U, Medical School) **Toward final personality integration: A measure for health, social change, and leadership.** (2nd ed). Cambridge, MA: Schenkman, 1975. xvii, 291 p.—Presents a schema for greater personal maturity and health and explores the strengths and weaknesses of Western concepts and Eastern ideas in order to obtain or give greater meaning to life. The author introduces his theories of psychocultural analysis as a means for developing fully integrated individuals.

2361. Battegay, R. (Psychiatrische Universitätspoliklinik, Basel, Switzerland) **[Psychodynamics of fear ("angst").]** (Germ) *Psychotherapie Medizinische Psychologie*, 1975(Jul), Vol 25(4), 128-136.—Suggests that man experiences fear when he becomes aware of the fact that he cannot develop within the coordinates of his inner world design and the outer world. To banish this fear from his life is considered an impossible task. Fear produces depression, a psychosomatic symptom, or a neurosis, the latter considered a retreat into a

"grandiose self." Attempts at defense against fear are considered mainly retreats into a "narcissistic group self" towards which the individual narcissism shifts. It is noted that R. S. Lazarus and J. R. Averill found such fears to be dangerous because the individual cannot prepare himself, since the onset is uncertain. Man has an innate preparedness for fear. According to either favorable or frustrating circumstances in life, it will be either reinforced or compensated for by work, alone or in groups. Human life proceeds against the background of mortality. Fear of death and fear of responsibility and life may prevent man from proceeding in life. Psychotherapy seeks to help in structuring human fears and transforming them into social activity.—S. D. Babcock.

2362. **Bierer, Joshua.** *Death: Unacceptable problem or unacceptable fact.* *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 1-3.—Presents an attitude toward death which views it as a friend rather than as a feared enemy. Cultural and historical fears of death are reviewed, and the penalty for unfamiliarity with death in childhood is that death becomes unthinkable and unmentionable. The giving up of notions of egocentric omnipotence and acceptance of change, metamorphosis, and permanent existence is suggested. Euthanasia is considered a duty when carried out according to the wishes of the hopelessly ill.—R. Tomasko.

2363. **Blai, Boris.** (Harcum Junior Coll) *Who is emotionally mature?* *Psychology*, 1975(May), Vol 12(2), 35-38.—Considers that emotional maturity is the basis for a sense of inner security and is related to the degree an individual is encouraged to exercise choices. Components of emotional maturity discussed include setting priorities, going easy with criticism, maintaining perspective, being sensible, talking it out, controlling anger, responding to others, taking charge, being generous, temporarily escaping, and occasionally giving in.—R. Tomasko.

2364. **Brenneis, C. Brooks & Roll, Samuel.** (Yale U, Medical School) *Ego modalities in the manifest dreams of male and female Chicanos.* *Psychiatry*, 1975(May), Vol 38(2), 172-185.—Examined the manifest dreams of 107 Chicano college students, using an inventory which captures the dream content and pattern. Striking differences between male and female dreams were found in the areas of setting, characters, interaction, self, instinctual modalities, and realism. Males' internal psychic world, as viewed through their dreams, tended to be organized around a highly visible and demarcated self seen as robustly active, randomly in motion, and often contentiously involved with unrelated others. The confines of this internal world were sketched in as broad, but were occupied by boundaries and barriers and often subject to unpredictable events. In contrast, the females' internal world contained a relatively less sharply defined and less robustly active self, but also a less contentious self with a greater range of interactions with more familiar characters. Narrower confines were matched by less emphasis on boundaries, greater predictability, and more goal-directed locomotion. (27 ref)—*Journal abstract.*

2365. **Brink, T. L.** (U Chicago, Divinity School) *The case of Hitler: An Adlerian perspective on psychohisto-*

ry. *Journal of Individual Psychology*, 1975(May), Vol 31(1), 23-31.—The problems of subjective bias on the part of the life historian, and the widespread, inaccurate accounts used in discussions of A. Hitler's psychohistory, are considered. Topics discussed include Hitler's inferiority feelings, his pampered childhood, friendships, career, marriage, the relation of his military life style to a guiding fiction, masculine protest, and genocide. The internal consistency of the Adlerian approach to Hitler's life and its implications for contemporary child-rearing and for military institutions are noted.—R. Tomasko.

2372. **Ehrenberg, Darlene B.** (Private practice, New York, NY) *The quest for intimate relatedness.* *Contem-*

porary Psychoanalysis, 1975(Jul), Vol 11(3), 320-331.

—Discusses the search for alternate forms of marriage, for liberation of men and women from stereotyped sex roles, and for increased sensitivity to the common human dilemma of both sexes. In the ordinary dyadic marital relational structure there is a continuum of relative intimacy. At one end are marriages based on what R. Laing calls collusion and L. C. Wynne calls pseudomutuality. At the other end is the marriage which achieves intimate relatedness. It is geared to redefinition with changing needs. Achievement of intimate relatedness does not depend on formal structure but on the inner capabilities of the individuals involved. Intimate self-knowledge is the precondition for intimate relation with others.—*M. J. Stanford.*

2373. Ellis, Albert. *On the disvalue of "mature" anger*. *Rational Living*, 1975(Spr), Vol 10(1), 24-27. —Replies to J. R. Lindley's (see PA, Vol 55:Issue 2) critique of the present author's (1973) theory of anger.

2374. Erhard, Werner; Guerin, Gilbert & Shaw, Robert. (Erhard Seminars Training Inst, San Francisco, CA) *The mind's dedication to survival*. *Journal of Individual Psychology*, 1975(May), Vol 31(1), 11-17. —Presents observations and conclusions regarding the central theoretical concepts of Erhard Seminars Training (EST). The process used in EST is designed to assist the individual to experience life with less automated, patterned, and repetitive behavior by increasing the individual's awareness of present experience. A 3-step process is described, involving behavior recognition, learning about the payoffs behind maintenance of patterned behavior, and learning about the true costs of a compulsion for the survival of the mind.—*R. Tomasko.*

2375. Ey, Henri. [The concept of reaction in psychopathology: Critical essay.] (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 43-62. —"Reaction" in the biological sense is an attempt to return to an equilibrium threatened by danger perceived from within or without the individual. In this sense, it is physiological (normal) because it tends to maintain or reestablish homeostasis. In the psychological sense the meaning of reaction is comparable: it is either a response to a normal situational stimulus or a defensive response. The introduction of the concept of "reaction" in psychiatry is a reaction against mechanistic concepts which consider psychiatric diseases as breakdowns in the nervous machinery. (German & Spanish summaries)—*English summary.*

2376. Fakouri, M. E. (Indiana State U) *Relationships of birth order, dogmatism and achievement motivation*. *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 216-220. —Administered the Rokeach Dogmatism Scale and the Achievement Imagery scale of the Iowa Picture Interpretation Test to 122 graduate students. Results indicate that dogmatism and authoritarianism are not related to birth order. Both male and female firstborns had higher Achievement Imagery scores ($p < .05$) than later borns. (15 ref)—*R. Tomasko.*

2377. Farley, Frank H.; Smart, Kim L. & Brittain, Clay V. (U Wisconsin, Madison) *Birth order, rank, and class of service in the military*. *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 227-231. —Tested the hypothesis that the highest military ranks would be more

frequently attained by firstborns and only-children by administering a questionnaire to 2,207 US Armed Forces personnel. Results indicate that firstborns attained higher ranks in the military and that employment in the different armed forces branches was not related to birth order.—*R. Tomasko.*

2378. Fisher, Seymour. (State U New York, Upstate Medical Ctr, Syracuse) *Effects of messages reported to be out of awareness upon the body boundary*. *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 90-99. —In a series of 8 studies with 207 male and 103 female undergraduates, out-of-awareness taped messages produced boundary decrement, as measured by the Barrier score (derived from the Holtzman Inkblot Test), in men. The messages variously included hostility, depression, body, vulnerability, and reassurance themes. All themes, when properly primed, resulted in boundary decline in men. Nonprimed and control conditions did not affect the boundary. Contrastingly, no significant boundary changes were produced by the primed out-of-awareness themes in women. It is proposed that men are more disturbed than women by feeling that material has gained entrance to them in a fashion which they cannot control. (31 ref)—*Journal abstract.*

2379. Ghazimorad, Roy. (U Arkansas) *A correlational study of patterns of subscription to a set of cliches, anxiety level, and internal-external dominance*. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2294-2295.

2380. Ghosh, Chitra & Singhal, Sushila. (U Delhi, India) *Ego strength and anxiety reactions of the college youth*. *Indian Journal of Psychology*, 1973, Vol 48(4), 15-22. —Administered the Bender-Gestalt Test and the Anxiety Questionnaire of the Institute for Personality and Ability Testing to 68 college students (52 girls and 16 boys). Results show high ego strength and high anxiety reaction.—*B. Roy.*

2381. Gordon, Edmund W. (Teachers Coll, Columbia U) *Affective response tendencies and self-understanding*. *Proceedings of the Invitational Conference on Testing Problems*, 1973., 1973, 14-20. —Discusses the importance of affective response tendencies as influences on an individual's achievement and adjustment in school, in work, and in personal life. Data indicate that temperament tends to have a high degree of stability over time, and that behavior disorders can be attributed to the mismatch between patterns of temperament and patterns of treatment. It is suggested that the development of a technology for assessing affective response tendencies should be given high priority and much effort.—*H. E. Yuker.*

2382. Gourd, E. William. (Bowling Green State U) *Cognitive complexity-simplicity and information processing in theatre audiences: An experimental study*. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2025-2026.

2383. Greiger, Russell. (U Virginia, Curry Memorial School of Education) *Self-concept, self-esteem and rational-emotive theory: A brief perspective*. *Rational Living*, 1975(Spr), Vol 10(1), 13-17. —Presents a rational-emotive framework for understanding self-concept and self-esteem. Coopersmith's (1967) definition of self-concept is challenged because of its static quality, rather

than self-evaluative process. Self-esteem is emphasized as it relates to the ABC paradigm. Certain irrational beliefs which influence the development of low self-esteem are discussed, and suggestions are made for intervention (e.g., the exploration of the reality of conceptions so that appropriate self-appraisal can be made).—G. J. Frankel.

2384. Hartocollis, Peter. (Menninger Foundation, Topeka, KS) **Mysticism and violence: The case of Nikos Kazantzakis.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 205-210.—An episode in Kazantzakis' life is analyzed in terms of mysticism as a manifestation of conflict with one's own aggression. Kazantzakis sought to have a mystical experience by identifying with religious figures. He eventually resolved the conflict around aggression by assigning to violence the role of serving universal love and the attainment of noble consciousness, which he identified with the salvation of God. When the threat of his own aggression was aroused concomitantly with sexual wishes, he developed a disfiguring psychosomatic symptom which "protected" him from the sexual encounter with its associated aggressive expression.—L. Lauro.

2385. Helland, Dale J. (U Michigan) **Sex-role correlates of adolescent self-esteem.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2026-2027.

2386. Hester, Wendell H. (Emory U) **Attitude orientation and academic achievement: A study of a sample of adolescents in the United States and Mexico.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2779-2780.

2387. Hlavsa, J. & Kobylka, J. (Inst pro rozvoj a realizaci vynálezectví a zlepšovatelství, Kabinet kreativity, Prague, Czechoslovakia) [**Mental states in the creative process.**] (Czec) *Československá psychologie*, 1974, Vol 18(2), 173-178.—Identified the psychological states and state changes present during the creative-work process by administering a 290-item questionnaire to 30 creative artists and 30 creative mechanical engineers who indicated their experience of the presence, absence, or change of each state during their creative work. 110 items noted by fewer than 16 artists or engineers were dropped and the remaining 180 responses analyzed by the chi-square test. Significant results were reported in 13 categories: tension-relaxation; activation level; thinking, imagining, and fantasy; memory; motivation, persistence, and goal mindedness; emotions; habits; personality, character, and self-esteem; social needs, sociability, and human relations; and physical. In all categories mental states were different during creativity. Some differences between artistic and engineering creators were found, especially in visual perception. Most changes appeared in the area of attention, motivation, and ideation and thought. It is concluded that in creativity certain psychological states are closed off and others relating to creativity become operational.—P. Babarik.

2388. Hopkins, Samuel W. (U Texas, Austin) **Behavioral and attitude changes produced from dissonance created between intrapersonal values and attitudes.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2766.

2389. House, Gwendolyn F. (U Michigan) **Orientations to achievement: Autonomous, social comparison**

and external. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2027.

2390. Jones, G. E. **Endings and beginnings: The experience of time passing.** *British Journal of Projective Psychology & Personality Study*, 1975(Jun), Vol 20(1), 9-14.—Discusses theories of how the ego integrates temporal events. It is hypothesized that people do not integrate their experiences of time passing either in terms of separate moments or a continuous flow but in terms of complete events which are experienced as whole units. The implications of this hypothesis are developed in terms of the ways in which individuals experience themselves as continuous or discontinuous during temporal changes. This theoretical analysis is illustrated with material from therapy interviews.—J. Adams-Webber.

2391. Kammerer, Th. [**Trauma and reaction.**] (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 81-91.—Defines bodily trauma and its metaphorical transposition to the psychic sphere. Psychological trauma is then discussed in its clinical aspects in 3 phases: shock, defense and readaptation, and reorganization. A traumatic event can only be understood in relation to the S's history and to the secondary losses which follow the trauma. Additional, iatrogenic, complications of trauma are also discussed. (German & Spanish summaries)—English summary.

2392. Kefir, Nira & Corsini, Raymond J. (Alfred Adler Inst of Tel Aviv, Israel) **Dispositional sets: A contribution to typology.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 163-178.—Presents a systematic approach to the development of a typology of people and behavior. 8 systems are reviewed: those of Hippocrates, A. Adler, K. Horney, R. Dreikur, K. Lewin, W. Sheldon, N. Kefir, and E. Borgatta. These systems describe 3 patterns of interaction: accord, conflict, and evasion. A 4th pattern, neutral, is also suggested to represent a self-controlled person. These patterns have value for clinical and heuristic applications. This approach illustrates a possible convergence of the ideas of others through a clinical factor analysis. (16 ref)—R. Tomasko.

2393. Klein, Ronald D. (U Massachusetts) **Evolving creative behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1003.

2394. Kraut, Robert E. (Yale U) **The scrooge and the good samaritan: The effects of labeling on giving to charity.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2767.

2395. Kuhlman, D. Michael & Marshello, Alfred. (1 Delaware) **Individual differences in the game motives of own, relative, and joint gain.** *Journal of Research in Personality*, 1975(Sep), Vol 9(3), 240-251.—218 undergraduates made decisions in same-sex dyads across 4 types of 3-choice decomposed games. An analysis of each S's choices was performed to see if he or she consistently pursued 1 of the 3 motives of own (individualism), relative (competition) or joint (cooperation) gain across all 4 decomposed games. 66% of the Ss manifested such consistency, and sex of S was unrelated to which goal was pursued. Of the remaining 32%, a sizable subgroup (1/3) made its choices in an altruistic fashion, attempting to maximize the outcomes of the other S. An analysis of variance of the California F Scale

scores of Ss in these motivational categories showed the competitive group as having the highest and the altruistic group as having the lowest mean authoritarianism score. Correlational analyses indicated negative r 's between degree of competition and F score, positive r 's between degree of altruism and F , but no apparent relation between F and either individualistic or joint gain choice.—*Journal abstract.*

2396. Lewis, Charles N. (VA Hosp, Bedford, MA) **Memories and alienation in the Vietnam combat veteran.** *Bulletin of the Menninger Clinic*, 1975(Jul), Vol 39(4), 363-369. Presents observations on the readjustment difficulties encountered by the Vietnam veteran who seeks psychiatric treatment. Typically he is a high school graduate with no prior record of psychological difficulty, well able to function in the service and to tolerate combat experiences. However, he has difficulties in returning to responsibilities of work and family. There is a sense of loss of ego-identity; a confused self-image, seemingly disconnected from a stable preservice adaptation, short-circuits his attempts to relate to life as before. Avoiding the differences between his earlier idealized memories about home and the reality of home, he can keep hidden long-suppressed dependency needs. Reminiscing, as a psychological response to crisis and hence an affective coping mechanism, is not available to him since it would rest on the earlier illusions. Suggestions as to psychotherapeutic approaches are offered. (15) ref.—J. Z. Elias.

2397. Lindsley, James R. (Bunker Hill Health Ctr, Charleston, MA) **On the value of mature anger.** *Rational Living*, 1975(Spring), Vol 10(1), 21-23.—Reviews and contrasts Ellis' (1973) notion of childish anger (the childish assertion of individual wants) with mature anger (the emotional force which asserts that people and society ought to act largely in accordance with certain values), positing that the latter is an appropriate and useful emotion. The rational emotive approach to anger (i.e., attempts to eliminate rather than modify anger along more rational dimensions) is criticized.—G. J. Frankel.

2398. McColley, Steven H. & Thelen, Mark H. (U Missouri, Columbia) **Imitation and locus of control.** *Journal of Research in Personality*, 1975(Sep), Vol 9(3), 211-216.—Hypothesized that (a) external individuals would imitate equally under a condition of model-reward and a condition of no model-reward and (b) internal Ss would demonstrate more imitation under a condition of model-reward than under the condition of no model-reward. 133 male undergraduates were classified as internal or external on the basis of their scores on Rotter's Internal-External Control Scale. Internals imitated a rewarded model significantly more than a nonrewarded model. Externals imitated both models equally and at a rate comparable to internals who observed a rewarded model. Ss' ratings of model competence were also positively related to imitation among internals but not among externals. Results support the general notion of the effect of observer characteristics on imitation.—*Journal abstract.*

2399. Mednick, Martha T.; Tangri, Sandra S. & Hoffman, Lois W. (Eds). (Howard U) **Women and achievement.** Washington, DC: Hemisphere, 1975. xiii,

447 p.—Presents a collection of 25 papers on the social psychological aspects of women and achievement, focusing on motivational factors and crosscultural and intracultural variations. Sex roles and social change, employment and education, and fear of success are covered. (2½ p ref)

2400. Mintz, Ira L. **Some thoughts on the evolution of Otto Rank's theory of the birth trauma.** *International Review of Psycho-Analysis*, 1975, Vol 2(2), 245-246.—Argues that Rank lived out his anxiety about being thrown from the protective womb of the psychoanalytic society into the world, with the development of a theory reflecting this conflict. Other unconscious factors contributing to the birth trauma theory are noted.

2401. Munsey, Cecil R. (United States International U) **Personality characteristics of collectors.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2028.

2402. Murray, Edward J. (U Miami) **Resolution of complex decisional conflicts as a function of degree of avoidance.** *Journal of Research in Personality*, 1975(Sep), Vol 9(3), 177-190.—Conducted 3 experiments with a total of 176 undergraduates and 26 graduate education students to examine the relationship between difficulty of conflict resolution and degree of avoidance using imaginary conflicts consisting of choosing to have more or less of certain personal characteristics. Double forms of conflict were used to control for complexity of choice. Exp I showed that double approach-approach conflicts were resolved more quickly than double approach-avoidance which in turn were faster than double avoidance-avoidance. Exp II showed a similar result using scaled judgments of subjective difficulty. In Exp III, the basic finding was shown to be independent of situational pressure by permitting an undecided choice and independent of individual differences in social desirability (Marlowe-Crowne Social Desirability Scale). (23 ref)—*Journal abstract.*

2403. Neufeld, Richard W. (U Western Ontario, London, Canada) **Effect of cognitive appraisal on d' and response bias to experimental stress.** *Journal of Personality & Social Psychology*, 1975(Apr), Vol 31(4), 735-743.—In a study with 60 college students, the effects of an intellectualization-denial passage designed to modify cognitive appraisal of stressor stimuli (gory scenes) were evaluated in terms of sensory-decision theory analysis. The passage was found to reduce "felt stress" (d') for certain pairs of the stimuli addressed by the passage content but to be less effective in reducing d' for stimuli not included in the passage. The criterion for reporting stress was reduced rather than increased with presentation of the passage for the included stimuli only. Differences in d' between Ss classified within treatment groups as repressors vs sensitizers (using Byrnes's Repression-Sensitization scale) were obtained for certain stimulus pairs generally in the direction of lower sensitivity for repressors. Results are discussed in terms of the effects of altered cognitive appraisal on the "prevention of stress" and on "defensive denial." (31 ref)—*Journal abstract.*

2404. Nystul, Michael S. (U Queensland, Brisbane, Australia) **The effects of birth order and sex on self-concept.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 211-215.—Studied the effects of birth order,

sex, and the interaction of birth order and sex on the self-concept of 168 university students, using the Tennessee Self-Concept Scale. Results indicate that female Ss had more positive feelings about their identity than males and had fewer basic personality defects and less of a tendency to avoid reality. Birth order did not have a significant effect on self-concept.—*R. Tomasko.*

2405. Pandey, R. E. Factor analytic study of attitudes toward death among college students. *International Journal of Social Psychiatry*, 1974-1975 (Win-Spr), Vol 21(1), 7-11.—Compared the factorial structures of the cognitive and feelings components of attitudes toward death among college students, using 132 Whites and 101 Blacks (81 males and 152 females). A test of 40 items having 5 Likert-type responses was constructed. The hypothesis that people of different races and sexes, having divergent temperaments and beliefs, will also show different factors involved in their attitudes toward death was not supported, because the factors of escape, depressive-fear, mortality, and sarcasm were common to them all.—*Journal abstract.*

2408. Petrovskii, V. A. (Scientific Research Inst of Problems of Institutes of Higher Learning, Moscow, USSR) [The psychology of personality activity.] (Russ) *Voprosy Psikhologii*, 1975 (May-Jun), No 3, 26-38.—Observed over 500 Ss, aged 14-40, in a perceptual-motor task that involved risk taking (loud noise, electric shock, social disapproval) to study the phenomenon of unmotivated risk taking and the attractiveness of danger. About 20% of the Ss could be described as takers of unmotivated risks. Among individuals whose occupation included elements of danger the proportion of unmotivated risk takers was about 75%. Additional experiments showed that this type of risk taking was unrelated to self-assertion, level of aspiration, or the tendency to take motivated risks. 3 approaches to an explanation of unmotivated risk taking are examined. One possible interpretation is that the anxiety created by the danger situation leads to a tendency to overcome danger, which in turn becomes a tendency to do so in a socially meaningful way. (English summary) (25 ref)—*L. Zusne.*

2409. Péllicier, Yves. (U Paris V, Faculté Necker, France) [Reaction and history of personality.] (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 7-17.—Discusses the concept of reaction in the various contemporary psychology movements.

2410. Rajput, Jenny H. (U Minnesota) Effects of expected effort, self esteem and problem-solving orientation on anticipatory attitude change. *Dissertation Abstracts International*, 1973 (Nov), Vol 34(5-A), 2769.

2411. Reid, David W. (U Waterloo, Canada) Multidimensionality of internal versus external locus of

control. *Dissertation Abstracts International*, 1973 (Nov), Vol 34(5-A), 2769.

2412. Saha, Sadhana & Sinha, Jai B. (A. N. Sinha Inst of Social Studies, Patna, India) The transfer of model effects on dependence proneness. *Indian Journal of Psychology*, 1973, Vol 48(4), 23-29.

2413. Sakellaropoulos, P. A discussion of the paper by Peter Hartocollis on "Mysticism and violence: The case of Nikos Kazantzakis." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 211-213.—Extends Hartocollis' analysis (see PA, Vol 55:Issue 2), to (a) aggression and (b) the connection between his psychosexual development and the conflict over love and hate. It is concluded that Kazantzakis idealized a great deal and sublimated little.—*L. Lauro.*

2414. Saunders, Bruce T. & Fenton, Terrence. (Waterford Country School, Educational & Clinical Services, Quaker Hill, CT) MMPI profiles of child care applicants at a children's residential treatment center. *Devereux Forum*, 1975 (Spr), Vol 10(1), 16-19.—Reports differences on the MMPI between those applying for an advertised child-care position and the normal population. All Ss (55 males and 21 females) showed atypical profiles; both groups were significantly more defensive than the norms, and males and females differed from each other on several subscales. Possible reasons for these differences are mentioned.

2415. Schimek, Jean G. (Yale U, Medical School) A critical re-examination of Freud's concept of unconscious mental representation. *International Review of Psycho-Analysis*, 1975, Vol 2(2), 171-187.—Freud's assumptions about perception and memory are examined, and their influence on his concept of mental representation indicated. Mental representation is related to external reality and drives, and Freud is considered to view cognition as nonmotivational and nondevelopmental. These assumptions are related to the distinctions between consciousness and unconsciousness, primary and secondary processes, and external and psychical reality. The concept of the unconscious as a storage container of specific images is concluded to be untenable and unnecessary. (33 ref)—*R. Tomasko.*

2416. Schwartz, Steven. (U Texas, Medical Branch, Div of Child Psychiatry, Galveston) Individual differences in cognition: Some relationships between personality and memory. *Journal of Research in Personality*, 1975 (Sep), Vol 9(3), 217-225.—Hypothesized that arousal, as indexed by personality measures of extraversion and neuroticism (Eysenck Personality Inventory), affects the way in which verbal material is organized in memory. 48 undergraduates pretested on measures of these personality variables participated in either a paired associates learning or a free recall experiment. On the paired associates task, Ss who were thought to be high on arousal made fewer errors when response terms were semantically similar than low arousal Ss. On the other hand, Ss thought low on arousal made fewer errors when response words were phonetically similar than high arousal Ss. On the free-recall task, low arousal Ss were found to cluster words together on the basis of semantic category at a higher rate than high arousal Ss. Results support the view that high arousal (as indexed by personality measures) leads to a focus on the physical

aspects of verbal material, whereas low arousal leads to a memory organized around semantic aspects. (30 ref) —*Journal abstract.*

2417. Silva, Jorge G. (Inst Nacional de la Nutrición, Mexico City, Mexico) **Two cases of female homosexuality: A critical study of Sigmund Freud and Helene Deutsch.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 357-387.—Questions Freud's interpretation of the case presented in his paper, "The Psychogenesis of a Case of Homosexuality in a Woman." Freud never presents any conclusive evidence that his patient was a homosexual. Rather, she was trapped in a narcissistic world of women because of a pregenital fixation on her mother. Freud overvalued his material and compounded his error by being caught in the web of libido theory. Focusing on a feminine Oedipus complex, he saw only the negative relation of the patient to her father and never understood the negative mother-daughter relationship. Deutsch is criticized for her theory that the libido is never feminine. In the case cited, her interpretation of her patient is different from that used by Freud. She makes no mention of an Oedipus complex and simply states that the patient's homosexuality was due to a primary pre-oedipal tie to the mother, strengthened by the weakness of her father and husband.—*M. J. Stanford.*

2418. Soppe, H. (Katholieke Hogeschool, Tilburg, Netherlands) **[The influence of reflectivity-impulsivity on information-processing in perception and thinking.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1975(Jun), Vol 30(4-5), 385-411—Reviews and discusses the results of several studies on the impulsivity-reflectivity (IR) dimension of behavior. J. Kagan (1966) considers the IR as a cognitive variable that influences behavior as indicated by reaction time and being independent of cognitive maturity level. The IR is measured by Kagan's Matching Familiar Figures Test. Impulsive Ss generally compare figures in the test with a global approach and proceed with alacrity; reflective Ss analyze alternatives and proceed more slowly than their counterparts. The IR may operate either independently or dependently of cognitive levels and apparently depends on the attitudinal approaches of the Ss. The IR is considered in terms of its behavioral specificity. Several conditions are indicated that could influence the IR reactions of the Ss: their cultural milieu, mind-sets with reference to the importance of the task, social-cultural reinforcements, factors of intelligence, and CA. (69 ref) —*A. J. Ter Keurst.*

2419. Starobinski, J. (U Geneva, Switzerland) **[Reaction: The word and its uses.]** (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 19-42.—Discusses the semantic development of the concept of reaction in psychiatry, as well as the evolution of ideas around that word (German, Spanish, & English summaries)

2420. Taylor, Irving A. & Getzels, J. W. (Eds.). (Lakehead U) **Perspectives in creativity.** Chicago, IL: Aldine, 1975. xiv, 353 p. Presents 14 papers on theory and research on creativity since 1950. Topics include the structure of intellect model, laboratory investigations of creative production, studies of artists and scientists, and creativity in the schools. (29% p ref)

2421. Tsujioka, Bien & Fujimura, Kazuhisa. [Social desirability factors in a personality inventory.] (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 69-77.—Extracted 3 social desirability (SD) factors and 7 temperamental factors from the YG Personality Inventory (Japan) administered to 300 college Ss. 1 SD and 4 temperamental 2nd-order factors were identified. The possibility of constructing new scales independent of SD factors is suggested. (English summary) (18 ref)—*S. Choe.*

2422. Wark, David M.; Swanson, Edward O. & Mack, Judy. (U Minnesota, Counseling Bureau, St Paul) **More on birth order: Intelligence and college plans.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 221-226.—Used the Minnesota Scholastic Aptitude Test to study 22,538 female and 22,770 male high school students representing almost all high school juniors in Minnesota. Results indicate a relationship between birth order and verbal intelligence. The proportion of planned college attendees decreased, and the proportion of students interested in technical training outside of college increased, as the birth order progressed from first- to last born.—*R. Tomasko.*

2423. Weller, Leonard; Hazi, Ophrah & Natan, Orah. (Bar Ilan U, Ramat-Gan, Israel) **Birth order and the feminine sex role of married women.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 65-70.—Administered the Feminine Role Behavior Scale and the Female Personality Trait Scale to 138 married female students. One of the scales indicated that current marital status will reinforce the conservative tendencies of a firstborn female married to a later born male, but not for a firstborn female married to a firstborn male. Differences in the approaches taken by the 2 scales to measure female personality traits are discussed.—*R. Tomasko.*

2424. Wisdom, Gayle & Walsh, Richard P. (Southern Illinois U) **Dogmatism and birth order.** *Journal of Individual Psychology*, 1975(May), Vol 31(1), 32-36.—144 college students were given the Rokeach Dogmatism Scale and a personal information questionnaire. Score differences were not statistically significant regarding the relation of birth order and sex to dogmatism. The homogeneity of dogmatism scores in firstborns as opposed to the variance in later borns indicates that firstborns might be raised more rigidly, and last borns more flexibly, in what they are allowed to believe.—*R. Tomasko.*

2425. Wright, Robert J.; Fox, Marian & Noppe, Lloyd. (Beaver Coll) **The interrelationship of creativity, self-esteem, and creative self-concept.** *Psychology*, 1975(May), Vol 12(2), 11-15.—Tested the hypotheses that a positive relationship exists between self-esteem and creativity, and self-esteem and an S's evaluation of his creativity. 80 junior and senior education majors were given the Tennessee Self-Concept Scale, 2 subtests from the Torrance Tests of Creative Thinking, and a specially designed measure of creative self concept. Results do not support the relationship between tested creativity and self-esteem. However, a significant relationship between creative self-concept and measured creativity was found.—*R. Tomasko.*

PHYSICAL AND PSYCHOLOGICAL DISORDERS

2426. Alderson, Michael. (Wessex Regional Health Authority, Medical Information Unit, Winchester, Eng.) Relationship between month of birth and month of death in the elderly. *British Journal of Preventive & Social Medicine*, 1975(Sep), Vol 29(3), 151-156.—In an analysis of mortality data for persons 75 and over in 8 subgroups, there was a consistent trend in deaths with an excess in the birth month and the following 3 mo. Further studies are planned to test whether "birthday stress" is a realistic explanation or whether other hypotheses need to be formulated. (37 ref)

2427. Bandořá, A. & Bőor, J. (Detská psychiatrická léčebna, Hraň, OUNZ Trebešov, Czechoslovakia) [Contribution to the question of onychophagia in children.] (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 325-328.—Studied 45 boys and 15 girls 4-15 yr olds with a history of nail-biting, to gain better understanding of this disorder. The following appeared significant: prevalence of onychophagy in boys; at puberty; on both hands; on left hand when unilateral; during emotional tension; in urban environment; at home or at school; in patients with low IQ. The habit was frequently diagnosed as symptomatic of a behavior disorder, encephalopathy, or neurosis. The families of nail-biting children rarely sought medical help, perhaps because they underestimated the importance of the underlying psychopathology. (Russian & English summaries)—V. Fischmann.

2428. Husák, T. & Škoda, Ct. (Výzkumný ústav psychiatrický, Prague, Czechoslovakia) [Comparison of diagnostic classification of so-called ideal BPRS profiles by computer and by man.] (Czec) *Československá psychologie*, 1974, Vol 18(2), 141-148.—Compared the blind diagnostic back assessment by 7 psychiatrists, the authors of the Brief Psychiatric Rating Scale profiles, with the diagnostic classification performed by a computer. The computer, deriving its classification rules by means of the STROJB program of ideal profiles, applied them to the single profiles with significantly higher reliability than the psychiatrists. (Russian summary)—English summary.

2429. Kozumplik, L. & Rýznar, J. (Psychiatrická léčebna, Opava, Czechoslovakia) [Findings of hepatitis B antigen in new patients and employees of the Opava Psychiatric Institute.] (Czec) *Československá Psychiatrie*, 1974 (Oct), Vol 70(5), 297-298.—Refers to previous (1973) findings of high incidence of positive hepatitis B antigen in hospitalized patients of the institute, and reports above-normal frequency of HB Ag in 1,170 new admissions (15%), 147 employees (3%), and 80 students (1%). In normal populations of the given geographic area the most frequent incidence of positive HB Ag is 0.1-0.3%. The study used the electro-immuno-diffusion method of determination.—V. Fischmann.

2430. Lickiss, J. Norelle. Health problems of urban Aborigines: With special reference to the aboriginal people of Sydney. *Social Science & Medicine*, 1975(Jun), Vol 9(6), 313-318.—Presents a perspective of the major health problems of urban Aborigines. An approach to the understanding and alleviation of these problems is

proposed, focusing primarily on an analysis of the stresses of Aborigines. (35 ref)

2431. Mellan, J. (Karlova U, Sexuologický ústav, Prague, Czechoslovakia) [Family situation during childhood of primary impotent males.] (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 291-296.—Interviewed 250 single, functionally impotent males to determine if this sexual disorder was related to disturbed and unhappy family situations in childhood. Ss were divided in 5 groups: (a) 24 never attempted intercourse; (b) 65 attempted intercourse but could not realize it; (c) 80 always had defective intercourse; (d) 67 had defective intercourse after a previous more or less normal sex life; and (e) 14 had sexual problems symptomatic of another organic condition. A 10-point scale was used in which the highest grade corresponded to a hypothetical ideal family situation. For each subjectively felt or objectively present factor reflecting a disturbed relationship between S and his father and/or mother, 1 point was deducted. Results show that, except for Ss in group (a) whose lack of sexual initiative seemed to be conditioned by factors unrelated to conflicts in childhood, the average number of points lost increased from group (b) to (c) to (d). (Russian & English summaries)—V. Fischmann.

2432. Morrant, J. C. (Mt Pleasant/Fairview Community Care Team, Vancouver, Canada) Medicines and mental illness in old age. *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 309-312.—Points out that commonly used over-the-counter drugs, hospital-prescribed drugs, and the widely-used psychiatric drugs can all cause problems in old people, problems that are sometimes mistaken for psychiatric illness.

Mental Disorders

2433. Aarons, Z. Alexander. Fetish, fact and fantasy: A clinical study of the problems of fetishism. *International Review of Psycho-Analysis*, 1975, Vol 2(2), 199-230.—Presents a verification of Freud's theory of the fetishistic phenomenon as the clearest evidence of the existence of the castration complex. In the present case study, a young man's identification with his mother during his early pre-oedipal period is considered the predisposing cause of the fetish (involving one-legged girls). The fetishist can allow himself to be intimate with the fetish, but not with what it symbolizes. Analytic success is dependent on a replication in the transference of the patient's efforts to overcome the originally traumatic deprivation. (24 ref)—R. Tomasko.

2434. Armstrong, Harvey & Patterson, Paul. (U Toronto, Canada) Seizures in Canadian Indian children: Individual, family and community approaches. *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 247-255.—Describes the family and cultural environment of more than 13 children in a remote northern Ontario Indian village who had hysterical seizures. These teenagers experienced intense conflict between their aspirations to join the affluent White world and their need to accept the prohibitions and limitations of their Indian village. 2 visiting psychiatrists interpreted these conflicts to 13 of the children, and made management recommendations to their parents and to community leaders, aimed at removing the secondary gains the children got from the seizures. After the psychiatrists' 3-

day visit, there was a marked decline in frequency of seizures (French, 1975, p. 104).

2435. Bell, Brian et al. (Psychologisk Inst, Copenhagen, Denmark) A longitudinal psychophysiological study of three year old Mauritian children. Preliminary report. *Developmental Medicine & Child Neurology*, 1974(Jun), Vol 17(3), 320-324. Given various psychophysiological and psychological tests to 1,800 3-yr-old children on Mauritius Island in an effort to find a possible predictor of later psychopathology, especially schizophrenia. On the basis of response to electrodermal stimulation 3 groups were selected, including 2 high-risk groups of "short recoverers" (Mednick, 1973) and "nonresponders" (Gruzelier and Venables, 1972). These and a control group will be followed up during the next 2 yrs (French, German, & Spanish summaries)—P. W. Pruyser.

2436. Bergenn, Victor W. (Columbia U) The relationship of adolescent test performance to subsequent psychiatric deviance. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1121.

2437. Boreham, John. (Tavistock Clinic, London, England) Planned focal psychotherapy: A conceptual and case study. *British Journal of Projective Psychology & Personality Study*, 1975(Jun), Vol 20(1), 1-7.—Describes a focal model of clinical assessment, therapeutic planning, and evaluation. This approach consists of 7 stages: (a) diagnostic exploration, (b) global dynamic hypotheses, (c) focal hypotheses, treatment plan and aims, (d) testing focal hypotheses, (e) treatment processes, (f) termination, and (g) follow-up. The case of a 30-yr-old depressed female patient with severe problems in sexual adjustment is used to illustrate planned focal therapy. A detailed treatment history is presented together with an analysis of her responses to an abbreviated form of H. Phillipson's (1955) Object Relations Technique. Test data at termination of therapy and follow-up material will be reviewed in a future paper.—J. Adams-Webber.

2438. Castelnuovo-Tedesco, Pietro. (Harbor General Hosp, Torrance, CA) Stealing, revenge and the Monte Cristo complex. *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 169-177.—Stealing as a symptom is explained in terms of the Monte Cristo story (i.e., that Monte Cristo did not earn his wealth, the treasure's burial site was a boy's purified vision of his mother, and Monte Cristo had no guilt). 2 case examples are presented in which the patients showed similar characteristics. It is concluded that (a) stealing is restitutive, (b) stealing is a channel for discharge of aggression and greed, (c) what is stolen may reflect a variety of possible meanings, and (d) stealing may often be based on the fantasy of having been the victim of a prior theft, hence the Monte Cristo Complex. (19 ref)—L. Lauro.

2439. Chiland, Colette. (U René Descartes, Paris, France) [Repetition compulsion and the death instinct.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 788-792. Presents a critical review of 2 concepts, repetition compulsion and the death instinct, with reference to the later writings of Freud.—Z. M. Cantwell.

2440. Colten, Sterling I.; Langlois, Joseph & Siegel, Robert. (Taunton State Hosp, MA) Survey of student attitudes toward the mentally ill. *Psychology*, 1975(May), Vol 12(2), 16-18.—Administered a question-

naire to 100 students in a high school, based on an attitude scale developed by D. Gilbert and D. Levinson (see PA 32 4293). Results indicate that Sh held humanistic, egalitarian attitudes toward the mentally ill. Sh held more negative attitudes toward the mentally ill in a more rural fashion than those in the suburbs. It is suggested that subtle differences between urban and rural attitudes may affect the development of mental health programming within a region and area.—R. Tomasko.

2441. Edelheit, Henry. Crucifixion fantasies and their relation to the primal scene. *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 193-199.—The Primal Scene Schema is expressed in primal scene fantasies of which crucifixion fantasies and their alternates constitute an important class. The Schema's primary form is expressed in the child's simultaneous or alternating dispositive identifications with the copulating parents and serves as the mental framework for male-female ambiguity. The secondary (regressed) form, expressed in the combined image of nursing mother and child superimposed on the image of the copulating parents, provides the mental framework for mother-child ambiguity, the prototype for fused identifications and other mental and cultural representations of self-dissolution. In conscious or unconscious crucifixion fantasies, the figure of Christ crucified represents the combined image of the parents and simultaneously the helpless observing child. The Schema's secondary form is expressed in identification with the Madonna (and child). The Primal Scene Schema is suggested as a psychological universal.—L. Lauro.

2442. Engelhart, Dominique. (U Paris X, Lab de Psychologie Expérimentale et Différentielle, Nanterre, France) [Discriminant analysis of drawing characteristics of "normal" and "disturbed" children.] (Fren) *Enfance*, 1975(Jan-Apr), No 1, 71-81.—House-Tree-Person drawings were obtained from 180 boys, half of whom were from public schools and half from a neuropsychiatric center. 10-, 11-, and 12-yr-olds were equally represented in each of the 2 samples. IQs varied from 90 to 120. The presence or absence of 17 characteristics of all 3 drawings considered as a whole, and of 26 items in the drawing of a man, was noted. Clinical judgments by 9 psychologists of a random sample of drawings were also used for comparison. Discriminant functions were derived and "predicted" classifications were compared with actual classifications. For all drawings, 7 items established 87.5% correct classifications and for the man, 9 items established 84.2% correct classifications. Clinical judgments and statistical findings were in accord. Drawings by normal children were more realistic and better integrated. (English summary)—S. S. Marzolf.

2443. Farnsworth, Dana L. Mental and emotional disturbances of the secondary school-age student. *Journal of School Health*, 1975(Apr), Vol 45(4), 221-225.

2444. Gaddini, Eugenio. A discussion of the paper by Henry Edelheit on "Crucifixion fantasies and their relation to the primal scene." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 201-204.—Supports Edelheit's argument (see PA, Vol 55:Issue 2) that expressions of the Primal Scene Schema are not limited to pathology. A developmental approach to the Schema is suggested.—L. Lauro.

2445. **Gainotti, Guido.** (U Cattolica, Clinica delle Malattie Nervose e Mentali, Rome, Italy) [Catastrophic reaction in the elderly patient with dementia: Comparison with secondary catastrophic reactions of focal lesions in adults.] (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 133-152.—Discusses the relationship between the concept of a "catastrophic reaction" and that of a "pathological reaction to an event," emphasizing Goldstein's description of catastrophic behavior. The relationship between catastrophic behavior and focal lesion in adults and the level of demential deterioration in elderly patients is discussed. (German, Spanish, & English summaries) (20 ref)

2446. **Gilka, Libuse.** *Schizophrenia: A disorder of tryptophan metabolism.* *Acta Psychiatrica Scandinavica*, 1975, Suppl 258, 83 p.—Experimental and clinical findings have suggested the hypothesis that, in schizophrenia, there is a defect in tryptophan metabolism and that restriction of dietary tryptophan might reduce accumulation of tryptophan metabolites, prevent the shift of tryptophan metabolism to other metabolic pathways, and thus prevent the production of psychotogenic tryptophan derivatives. The present review of biochemical and genetic studies on schizophrenia suggests that (a) each schizophrenic should have tests of tryptophan metabolism, determination of MAO activity, and other biochemical tests; clinically latent carriers also can be detected by this method; and (b) regular urine testing for tryptamine can detect its increase, indicating imminent psychotic exacerbation and enabling proper prophylaxis. (5 p ref)

2447. **Gnepp, Eric H.** *Learning and anxiety neurosis.* *Psychology*, 1975(May), Vol 12(2), 27-31.—Applies learning theory to explain how the anticipatory response to anxiety becomes dysfunctional. The use of a time variable in the interaction of learning principles is discussed as an explanation of neurotic anxiety. Neurotic anxiety results when one's perceptions and behaviors are not fully consonant with reality. Learning is related to cognitive dissonance, and an example is presented illustrating the false beliefs as a basis for neurotic anxiety. The impact of positive feedback in increasing anxiety is also suggested.—*R. Tomasko.*

2448. **Hinterhuber, Hartmann & Prokop, Heinz.** (U Innsbruck, Nervenlinik, Austria) [Psychological problems and psychiatric vulnerability among university students.] (Germ) *Nervenarzt*, 1975(Feb), Vol 46(2), 73-75.

2449. **Howe, Margaret G. & Madgett, Maribeth E.** (London Psychiatric Hosp, Canada) *Mental health problems associated with the only child.* *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 189-194. Compared 80 males and 35 females (mean age = 8 yrs) who were "only" children with 77 males and 38 females who had siblings, using the files of the London (Ontario) Mental Health Clinic. "Only" children (a) did not differ significantly from controls in intelligence, school progress, or reason for referral; (b) were more often described as submissive and less often as aggressive; (c) had more repeat visits to the clinic; and (d) had more overprotective and less often rejecting mothers. (19 ref) (French summary)—*F. Auld.*

2450. **Hronek, J. & Pavlovský, P.** (Karlova U, Psychiatrická klinika, Prague, Czechoslovakia) [Some changes in cerebrospinal fluid in schizophrenic patients.] (Czec) *Ceskoslovenská Psychiatrie*, 1974(Oct), Vol 70(5), 280-283.—Compared cerebrospinal fluid and serum activity of lactic dehydrogenase (LDH) and glutamic oxaloacetic transaminase (GOT) in 16 short-term (less than 2 yrs) and 20 chronic (11.5 yrs average) young adult schizophrenics. While the increase of LDH in the 2 groups of patients was not significantly different, the GOT activity was much higher in the fluid of chronic than short-term schizophrenics. The findings, suggesting necrotic changes in CNS, are discussed in the light of similar results reported in the literature. It is concluded that if the possible effects of preceding therapeutic interventions (medication, insulin coma, ECT) are not considered, the higher activity of the GOT enzyme in chronic schizophrenics supports the contention that schizophrenia has an organic basis. (Russian & English summaries)—*V. Fischmann.*

2451. **Huber, R. John & Davis, R. Elizabeth.** (Meredith Coll) *Selective attention behavior and improvement in therapy as predicted by Adler's social interest hypothesis.* *Journal of Individual Psychology*, 1975(May), Vol 31(1), 79-84.—Examined the relationships between development, adjustment, and selective attention behavior. 40 acute schizophrenic females were studied, using double-aspect, human vs nonhuman stimuli. Results provide tentative support for A. Adler's social interest hypothesis by successfully predicting the changes in selective attention behavior for clients improving in therapy.—*R. Tomasko.*

2452. **Jakubaschik, J. & Werner, J.** (U Heidelberg, Sozialpsychiatrische Klinik, Mannheim, W Germany) [The delimitability of psychiatric diagnoses.] (Germ) *Nervenarzt*, 1975(Feb), Vol 46(2), 76-84.—192 judges (MDs and clinical psychologists) rated the degree to which each of 52 items (including symptoms, indications as to history, etiology, course) characterized each of 10 psychiatric diagnoses (using the 8th revision of the World Health Organization classification). Agreement between individual raters and mean ratings, with other data analyses, was better for endogenous psychoses than for neuroses and personality disorders.—*J. Rutschmann.*

2453. **Kielholz, Paul & Hole, Günter.** (U Basel, Psychiatric Clinic, Switzerland) [Reactive depression: Theoretical conception and clinical empiricism.] (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 111-132.—Reactive depression, the simplest form of psychogenic depression, is defined as an abnormal reaction to circumstances superimposed on a depressive syndrome. Psychoanalytic schools have formulated psychodynamic concepts emphasizing the narcissistic choice of the object or an oral disturbance to explain the pathological, depressive effect of frustrative situations. Clinical psychiatry, on the other hand, defines certain phenomenological types of reaction and delineates reactive depression with reference to other kinds of depression. (German & Spanish summaries) (57 ref)—*English summary.*

2454. **Kiraly, S. J.** (Clark Inst of Psychiatry, Toronto, Canada) *Folie à deux: A case of "demonic possession" involving mother and daughter.* *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 223-227.—Ex-

plains the dynamics of a case of *folie à deux* in terms of symbiosis (with oral dependency by the one partner, control by the other), aggression, and projection. (French summary)

2455. Kligerman, Charles. A discussion of the paper by Pietro Castelnuevo-Tedesco on "Stealing, revenge and the Monte Cristo complex." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 179-181.—Discusses the validity of P. Castelnuevo-Tedesco's (see PA, Vol 55:Issue 2) view that pathological stealing is an expression of narcissistic revenge but argues that *The Count of Monte Cristo* does not present evidence supporting this view.—L. Lauro.

2456. Lee, A. Russell. (Emanuel Mental Health Ctr, Turlock, CA) Levels of imperviousness in the schizophrenic's family. *Psychiatry*, 1975(May), Vol 38(2), 124-131.—Defines imperviousness as an individual's inability (or unwillingness) to consciously grasp, become aware of, register, and acknowledge another person's interpersonal perception, despite the fact that this perception has been clearly stated or presented to him. Levels of imperviousness are discussed which are characteristically established within the parent-child subsystem in the schizophrenic's family. The presence of imperviousness in other subsystems within the family (i.e., between the husband and wife or between the children themselves) is also acknowledged.—*Journal abstract*.

2457. Levy, Leo. (U Illinois, Medical Ctr, Chicago) Social class and mental disorder. *Psychiatra Clinica*, 1974, Vol 7(4-5), 271-286.—Reviews the literature on the relationship of social class status to the incidence and prevalence of mental disorder. For purposes of this review, social class is divided into 3 categories: the affluent, working class, and poor. Mental disorders referred to are schizophrenia, manic-depressive psychosis, psychoneurosis, diseases of the senium, personality disorders, and the combined category "mentally ill." It is concluded that the rate of existing mental disorder among the poor is substantially higher than among the affluent or working-class groups. Low social-class status is held to be unrelated to the incidence of functional psychosis (i.e., schizophrenia and manic-depressive psychosis). (34 ref)—*Journal abstract*.

2458. Lindinger, H. (Niederösterreichischen Landeskrankenhaus für Psychiatrie und Neurologie, Mauer-Amstetten, Austria) [The problem of inaccuracies in psychiatric anamneses based on secondary sources: Contributions from case reports.] (Germ) *Nervenarzt*, 1975(Feb), Vol 46(2), 85-91.

2459. McCabe, Michael S. (U Iowa, Medical Coll) Reactive psychoses: A clinical and genetic investigation. *Acta Psychiatrica Scandinavica*, 1975, Suppl 259, 133 p. Investigated the possibility that reactive psychosis represents a diagnosis distinguished clinically and genetically from other functional psychoses. Interviews were conducted with 40 probands representative of patients in Denmark with a diagnosis of reactive psychosis and 119 of their relatives. Factors studied included observed personality traits, prior psychiatric disturbance, symptomatology, hospital diagnoses, treatment, sibling comparisons, genetic variables, and morbidity risk. Results indicate that reactive psychosis

represents a 3rd functional psychosis after manic-depressive psychosis and schizophrenia. (6 p ref)—R. Tomasko.

2460. McNeil, T. F. & Kaij, L. (U Lund, Malmö, Sweden) Length of interbirth intervals in female psychiatric patients and controls. *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 219-222.—Contrasts length of 121 interbirth intervals for 77 multiparous female psychiatric patients with the length of 605 intervals for 385 matched population control females to test a clinical observation that female psychiatric patients often have long intervals between consecutive children. No significant difference was found between all patients vs all controls or between any patient group vs its control group. (French summary)—F. Auld.

2461. Meyer, J.-E. (U Göttingen, Psychiatrische Klinik, W Germany) [The theme of death and the origin and course of obsessional neuroses.] (Germ) *Psychotherapie Medizinische Psychologie*, 1975(Jul), Vol 25(4), 124-128.—Maintains that the phobias which often precede and are the initial phase of obsessional neuroses are caused by life-threatening experiences concerning the patient himself or those near him. Later, the fear of death in both forms of the anankastic syndrome is replaced by fear of day-to-day circumscribed dangers. This ends in an anxiety for perfection, for absence of interference with his own actions—fears and self-questioning which cannot be recognized in the characteristics of the original threats. Origin and course, particularly the change to banal worries, will show the psychodynamic relevance of mortality for the cause of obsessional neuroses. Obsessional symptoms serve to fight against fear of death; they displace the fear of unexpected death, of dying, or of an unfulfilled life.—S. D. Babcock.

2462. Náměstek, S. & Hronek, J. (Patologickoanatomické oddělení Psychiatrické léčebny, Dobruška, Czechoslovakia) [Dermatoglyphs in hospitalized schizophrenic patients and their importance in the genesis of schizophrenia.] (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 284-290.—Compared finger, palm, and toe prints of 320 hospitalized adult schizophrenics and 100 normal children, who were selected as a control group because their family history showed no incidence of mental disorders. The main focus was on patterns in the region of the first finger, thenar and interdigital slots. Penrose's nomenclature (1968) was used and results in percentage are presented graphically. It is concluded that, contrary to some other hereditary diseases where the dermatoglyphic examination has been of proven value, this approach is clinically useless in schizophrenia. It is believed that family incidence of mental disorders is a better proof of the genetic origin of schizophrenia than dermatoglyphs. (Russian & English summaries) (18 ref)—V. Fischmann.

2463. Nesvadbová, L.; Gebhart, J. & Tumová, H. (Karlova U, Klinika pracovního lékařství lékařské fakulty y hygienické, Prague, Czechoslovakia) [Risky working conditions from the psychiatric point of view.] (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 312-319.—Studied biographic data, personality characteristics, work history, job satisfaction, absenteeism due to illness, and number of visits to medical and psychiat-

ric clinics of 85 female crane operators at 2 industrial enterprises. Ss were interviewed, and examined with Eysenck's Personality Questionnaire. The physical conditions (heat, noise, ventilation, air pollution, seating arrangement, etc) of their workplaces were analyzed and compared. No significant differences in age, high neuroticism, absenteeism, and length of employment of the 2 groups were found. But while 14 out of 50 workers at enterprise "S" were treated at the psychiatric clinic, none of the 35 workers at enterprise "K" manifested neurotic difficulties clinically (no visits to the psychiatrist). The etiopathogenic role of working conditions that were much worse at "S" than "K" is stressed. Periodic psychiatric and psychological examinations of workers in selected occupations are recommended. (Russian & English summaries) (18 ref)—V. Fischmann.

2464. Ornitz, Edward M. & Walter, Donald O. (U California, Ctr for the Health Sciences, Brain Research Inst, Los Angeles) **The effect of sound pressure waveform on human brain stem auditory evoked responses.** *Brain Research*, 1975, Vol 92(3), 490-498. —Obtained short-latency click-evoked responses from 20 20-31 yr old normal adults and 2-12 yr old children and 8 autistic children. Results show that (a) there was a significant tendency for differential responses to rarefaction and condensation clicks to occur in the younger Ss; (b) the autistic Ss showed a significantly greater tendency to have out-of-phase responses to the 2 types of clicks; and (c) there was a close correspondence between the responses to the 2 types of clicks in the adult Ss. (34 ref)

2465. Ortmann, Jorgen. (Kommunehospitalet, Copenhagen, Denmark) **Psychiatric research and publications from Kommunehospitalet (1875-1960).** *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 35-43. —A review of the literature published by the Kommunehospitalet in Copenhagen indicates that the literature can be divided according to 2 basic models of psychiatric disorder: (a) the biologically-oriented model and (b) the interpersonal or social model. Model (a) held that mental illness was a bodily illness and nothing else, an illness which assails the brain. Abnormal mental phenomena were only of interest insofar as they could be used as indicators of a morbid state of the brain. Model (b) maintained that interpersonal relationships played a major role in the development of psychiatric disorders. (33 ref)—M. E. Pounsel.

2466. Payne, Phillip & Shean, Glenn. (Coll of William & Mary) **Autonomic responses of paranoid, nonparanoid schizophrenic, and normal subjects to affective visual stimulation.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 123-129. Determined patterns of cognitive appraisal and autonomic reactivity which characterize groups of normals, and paranoid and nonparanoid schizophrenics. Ss were 10 normal male undergraduates, 10 male nonparanoid schizophrenics (mean age, 38.1 yrs), and 10 male paranoid schizophrenics (mean age, 35.8 yrs). Results indicate that both groups of schizophrenics evidenced electrodermal habituation and increased finger pulse constriction in response to 3 color homicide slides. Data from normals indicate that stress stimuli became less disturbing over trials and displayed both electrodermal and digital vasomotor habituation. Electrodermal habituation

curves for paranoids and normals were similar, with nonparanoids evidencing slower habituation. Paranoids tended to underrate or deny their emotional reactions. —*Journal abstract.*

2467. Perris, Carlo. (U Umea, Sweden) **A study of cycloid psychoses.** *Acta Psychiatrica Scandinavica*, 1974, Suppl 253, 77 p.—Investigated the hypothesis that cycloid psychoses represent a relatively consistent pattern of disease with respect to onset, recurrence, outcome, and, in many cases, symptomatology. A multifactorial study of 60 patients and their families was conducted. Factors considered included birth rank, parental deprivation, personality patterns, occupational status, celibacy and fertility rates, age at 1st episode, precipitating factors, symptomatology, and prognosis. The hypothesis was confirmed; moreover, these psychoses showed a high degree of intrafamilial consistency. (7 p ref)—R. Tomasko.

2468. Resnick, Salomon. [The role of the body in psychotics: A group experience.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 589-596.—Psychotics show many physical and psychosomatic reactions that indicate their level of adjustment and the need to bridge the gap between nonverbal (body) and verbal expression.

2469. Roth, B. & Nevsimalova, S. (Charles U, Medical Faculty, Prague, Czechoslovakia) **Depression in narcolepsy and hypersomnia.** *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1975, Vol 116(2), 291-300.—Studied the occurrence of depression in 100 randomly selected patients with narcolepsy and in 30 patients with hypersomnia. In the isolated form of idiopathic narcolepsy (without signs of cataplexy, sleep paralysis, or hypnagogic hallucinations) depression occurred in 28.6% of cases. In idiopathic narcolepsy with cataplexy or other symptoms of sleep dissociation, depression was found in 17.2% of cases. In idiopathic hypersomnia the occurrence of depressions was 26.1%. In most cases the endogenous form of depression was observed. No occurrence of depression has been noted in the symptomatic form of narcolepsy and hypersomnia. In most cases a parallel clinical course has been observed between the manifestation of depression and narcolepsy or hypersomnia. During a remission of the depressive state the hypersomniac symptoms decreased or disappeared totally. —*Journal abstract.*

2470. Rubins, Jack L. (Karen Horney Psychoanalytic Inst & Ctr, New York, NY) **The relationship between the individual, the culture, and psychopathology.** *American Journal of Psychoanalysis*, 1975(Fall), Vol 35(3), 231-249. Discusses the relationship between individual psychopathology and sociocultural conditions. 4 basic problems are analyzed: (a) the nature of the changing sociocultural factors that influence personality; (b) how these factors directly affect the individual; (c) how interactive and internal factors produce psychopathology; and (d) how the expression of illness can be inhibited, facilitated, or modified by social mores. The theoretical contributions of Horney, Sullivan, Fromm, Kardiner, and other psychoanalysts to these issues are reviewed. Changing forms of neuroses and psychoses are related to corresponding shifts in attitudes and social norms; the influence of specific cultural factors on individual

development are described, and the implications of these factors for social intervention and treatment are considered. (18 ref)—*J. Adams-Webber.*

2471. **Rusinová, V.** (Ústav bezpečnosti práce, Sofia, Bulgaria) [Differences in the effect of mental stress on performances of healthy and neurotic individuals.] (Czech) *Československá Psychologie*, 1974, Vol 18(2), 149-156.—Investigated the effects of stress on 120 college students, 48 suffering from anxiety neurosis and attending the psychological clinic and 72 normals as defined by the Eysenck Personality Inventory, B scale. Positive stress was created by money reward for rapid completion of the task and negative stress by frustration. Stress was measured by increase in pulse rate. The dependent variables were rate and error scores on tests of continuous discrimination, the Seven test, memory tasks, and logical thinking. Neurotics experienced greater stress than normal Ss. Reward motivation improved performance of normals and impaired the performance of neurotics. Differences between neurotics and normals on the memory task led to the conclusion that neurotics should work under less stress and on work with a lesser memory requirement. (Russian & English summaries) (15 ref)—*P. Babarik.*

2472. **Schuckit, Marc A.; Daly, Veronica; Herman, Gerard & Hineman, Sherry.** (U Washington, Alcoholism & Drug Abuse Inst, Seattle) **Premenstrual symptoms and depression in a university population.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 516-517.—The correlation between a premenstrual syndrome based on emotional symptoms and primary affective disorder was prospectively studied in 105 college freshmen. Students with premenstrual symptoms were twice as likely as controls to have a history of serious depressive episodes and twice as likely to have a close family member with depression. 7% of the Ss with premenstrual emotional symptoms and none of the controls had an affective episode during the ensuing year. The premenstrual syndrome did not interfere with academic performance and was not associated with any lowering of professional aspirations. The inconsistent results of past research on the relationship between depressive disorder and premenstrual symptoms may have been the consequence of differing definitions in different studies. The final answer on this possible association may result from using a clear definition of premenstrual symptoms based on emotional difficulties and well defined research-oriented criteria for the diagnoses of affective disorder.—*Journal summary.*

2473. **Schulsinger, Fini & Jacobsen, Bjorn.** (Kommunehospital, Copenhagen, Denmark) **The heredity-environment issue in psychiatry: Perspectives from research at the Psykologisk Institut, Department of Psychiatry, Kommunehospitalet.** *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 44-58.—Reviews high risk, chromosome, and genetic factor studies conducted at the Psykologisk Institut in Copenhagen to investigate S. A. Mednick's theory of schizophrenia (see PA, Vol 37:5497) which holds that schizophrenia occurs in persons with a certain physiological predisposition. They are characterized by abnormally large responsivity to a mild stress, as measured by the amplitude of the GSR. Their conditionability and tendency towards stimulus generalization is increased, and they show abnormality in the recovery

time of the GSR. Results of 3 high risk studies are presented, and the experimental designs used in the chromosome and genetic factor studies are discussed. (17 ref)—*M. E. Pounsel.*

2474. **Shanmugam, T. E. & Raja, Indira.** (U Madras, India) **A study of cognitive dissonance among neurotic children.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 14-17.—Presented a set of attractive pictures to 20 male and 20 female 9-13 yr olds, half of them neurotic outpatients and the other half normal students, and promised to give the pictures receiving median ranks in preference as presents to the Ss. A 2-way analysis of variance performed on the Ss' cognitive dissonance scores revealed a significant difference between neurotics and normals and a significant Sex \times Neuroticism interaction. Neurotics demonstrated more cognitive dissonance than normals, and males were more affected by cognitive dissonance under the neurotic condition.—*Journal abstract.*

2475. **Singer, K.** **Depressive disorders from a transcultural perspective.** *Social Science & Medicine*, 1975(Jun), Vol 9(6), 289-301.—Reviews the literature on cultural variations in prevalence and manifestations of depressive disorders and the cultural elements and psychopathological hypotheses proposed to account for such variations. Conceptual issues and methodological problems of research in this field are evaluated, and some requirements for future research are proposed. It is concluded that there is insufficient evidence to support a prevalent view that depressive illness in primitive and certain other non-Western cultures has outstanding deviant features. (170 ref)—*Journal abstract.*

2476. **Soulé, Michel & Soulé, Nicole.** (Inst de Puériculture, Ctr de guidance infantile et hôpital de jour, Paris, France) **[Reactive disorders in child psychiatry.]** (Fren) *Confrontations Psychiatriques*, 1974, Vol 7(12), 63-80.—Considers some of the points of the debate raised by the introduction of the term "reactive disorder" in child psychiatry. Certain diagnostic features whereby reactive disorders may be distinguished from neurotic states are also discussed. (German, Spanish, & English summaries)

2477. **Sperber, Michael A.** (Massachusetts General Hosp, Belmont) **Symbiotic psychosis and the need for fame.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 517-534.—Attempts to synthesize H. Tartakoff's concept of the "Nobel Prize complex" and M. Mahler's concept of symbiotic relations, thus formulating a "performance-oriented symbiosis." This is seen as a dyadic parent-child relationship in which the child gains approval only through achieving or striving to attain a goal which gives vicarious satisfaction to the parent. Case histories illustrate the performance-oriented symbiosis. A mother-son dyad and a father-daughter dyad are discussed in detail to illustrate the familial relations. It is felt that these patterns may be best understood in terms of object relations.—*G. S. Speer.*

2478. **Stolorow, Robert D.** (Rutgers State U, New Brunswick, NJ) **A note on devouring and being devoured.** *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 285. Describes the case of a narcissistically disordered male patient with borderline features whose imagery of devouring and being devoured seemed more

closely related to actual childhood experiences than to primitive oral-cannibalistic instinct derivatives.

2479. Stolorow, Robert D. (Rutgers State U, New Brunswick, NJ) **Narcissus revisited.** *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 286.—A reexamination of the myth of Narcissus revealed allusions to the defensive-reparative function of narcissism recognized by K. Horney.

2480. Sushinsky, Leonard W. & Wener, Richard. (U Illinois, Chicago Circle) **Distorting judgments of mental health: Generality of the labeling bias effect.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 82-89.—Conducted 3 studies to investigate the generality of the labeling bias effect (i.e., when Ss judge normal individuals as mentally ill as a function of diagnostically irrelevant stimuli). Exp I failed to find the effect with 60 undergraduates but demonstrated that these Ss can discriminate an audiotape recording of a psychiatric patient from a tape of a normal person. Exp II demonstrated labeling bias in 45 mental health service workers. Exp III produced labeling bias in 100 undergraduates by manipulating the "relevance" of the prestige figure. Data indicate that, contrary to previous interpretation, professional identity is not a necessary condition for producing labeling bias. Reanalysis of the data of previous research supported the hypothesis that labeling bias is extremely general and probably related to attractiveness of the communicator who gives the suggestion of mental illness, setting, ambiguity of desired response, and other similar variables in the social psychology literature. (26 ref)—*Journal abstract*.

2481. Topiář, A. & Dušková, M. (Krajský ústav národního zdraví, Psychiatrická léčebna, Opava, Czechoslovakia) **[To the question of symbiotic psychoses.]** (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 320-324.—Presents and discusses folie à deux in 2 matrimonial couples where the wives were primarily disturbed (innovational paranoid psychosis) and the husbands accepted the delusional ideas of their spouses. The psychoreactive and psychodynamic aspects of the genesis of the induced psychosis are stressed. It is conceptualized as a mutual defense against the threatened disintegration of partnership as a functional unit. (Russian & English summaries)—*V. Fischmann*.

2482. Vinařová, E. (Výzkumný ústav psychiatrický, Prague, Czechoslovakia) **[Follow-up of depression in patients.]** (Czec) *Československá Psychiatrie*, 1974(Oct), Vol 70(5), 275-279.—Re-examined 49, 39, and 21 ex-patients diagnosed as having endogenous depression 6, 12, and 24 mo after their 1st admission. Social integration was evaluated on a 10-point and mental status on a 5-point scale. A statistically significant ($p < .01$) relationship between psychopathology and employment status was found. (Russian & English summaries)—*V. Fischmann*.

2483. Weiss, Jeffrey J. (North Central Massachusetts Mental Health Ctr, Fitchburg) **A case example of the borderline personality organization.** *Psychotherapy, Theory, Research & Practice*, 1974(Win), Vol 11(4), 383-386

Presents a case study of a 41-yr-old married female hospitalized with a diagnosis of borderline personality. The borderline personality is portrayed as the failure to integrate the primitive loveable and hated ego states and

the resulting splitting of the ego demonstrated in the transference situation.—*C. McCreary*.

2484. Wenning, Claire S. (Columbia U) **Mother-child interaction: A study of allocation of time spent within the home in families with a child in psychotherapy.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2183.

2486. Wiener, P. (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) **[Psychosis: Field of force, structure, process, sickness.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 665-668.—Examines distinctions between field of force, structure, process, and sickness as 4 levels in the analysis of the concept "psychosis."—*Z. M. Cantwell*.

2487. Williams, Sara & Harper, Juliet. (North Ryde Psychiatric Clinic, Australia) **A study of etiological factors at critical periods of development in autistic children.** *International Journal of Mental Health*, 1974(Spr), Vol 3(1), 90-99.—Analyzes information about 97 autistic children in New South Wales, observed for 10 yrs, whose parents have been under different forms of treatment. It was noted that these children tended to come from the upper socioeconomic class. Early infantile autism is regarded as a malignant disorder with multiple etiology. The causes, both organic and environmental, were experienced by the patients as additive in decreasing their sensory experiences. It appeared that the longer the psychosis was active, the more severe were the intellectual deficiencies. Follow-up analysis demonstrated that the outcome of treatment was not encouraging in terms of educational adjustment.—*A. H. Alawi*.

2488. Yudkovitz, Elaine; Lewison, Nancy & Rottersman, Judy. (Jewish Board of Guardians, Henry Ittleson Ctr for Child Research, New York, NY) **Communication therapy in childhood schizophrenia: An auditory monitoring approach.** *Psychosocial Process*, 1975(Spr), Vol 4(1, Mono), 205 p.—Proposes an auditory monitoring model which is both developmental and dynamic. Research related to the model is discussed and analyzed. The possible relationship of this model to children diagnosed as schizophrenics is considered in terms of family communication patterns. A 6-stage communication therapy program is proposed that includes scanning, comparing, and modeling phases. 4 detailed case studies illustrate the therapeutic process. It is concluded that the present therapeutic work, while demonstrating positive effects, must be considered as pilot research to guide subsequent studies using larger populations and control groups. (6 p ref) *G. R. Allen*.

2489. Zeldine, G. et al. (Ctr Hospitalier Universitaire, Service de Psychiatrie, Dakar, Senegal) **[About the use of rating scale in transcultural psychiatry.]** (Fren) *Encephale*, 1975(Feb), NS Vol 1(2), 133-145. Reports on problems of measuring acute depression in Black African patients in Senegal. Many items of a Ninth version of the Hamilton Rating Scale for Depression seem inapplicable because of cultural differences in the symptomatology of depression. Some symptoms are apparently culture free; others seem profoundly influenced by the ties of the

individual to his social group. Evaluation of symptomatic change during treatment with antidepressant medication is difficult, because the 2 types of symptoms are mixed.—K. J. Hartman.

Behavior Disorders & Antisocial Behavior

2490. Bancroft, J. H. et al. (U Oxford, England) **Self-poisoning and self-injury in the Oxford area: Epidemiological aspects 1969-73.** *British Journal of Preventive & Social Medicine*, 1975(Sep), Vol 29(3), 170-177.
2491. Bower, K. Bruce & Mercer, Cecil D. (U Virginia, School of Education) **Hyperactivity: Etiology and intervention techniques.** *Journal of School Health*, 1975(Apr), Vol 45(4), 195-202. —Reviews terminology, research, and speculation in the literature about hyperactivity or hyperkinesis in children. Discussion about etiology focuses on theories implicating pathophysiology, disorders of attention and motivation, and reinforcement. Intervention strategies include reduction of environmental distractions, verbal mediation, stimulants, tranquilizers, behavior modification, and modeling. It is suggested that the diagnosis of hyperkinesis should take into account a variety of more specific behaviors, of which increased activity level is only one. Treatment should be selected with regard to specified target behaviors, keeping in mind possible detrimental side effects. Drugs should be considered only when other interventions have failed. (44 ref)—J. D. Pauker.
2492. Busch, H. & Feuerlein, W. (Freien U, Psychiatrischen Klinik, Berlin, W Germany) **[Socio-psychological aspects in marriages of alcoholic women.]** (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1975, Vol 116(2), 329-341.—In a 2-yr controlled study psychological and sociological data were collected on partners of chronic female alcoholics, using a semistandardized interview, the Freiburger Persönlichkeits Inventar, and the Hawie-Dahl test (a German abbreviated version of the WAIS). Interpersonal perception in the marriage of the female alcoholic was investigated by a semantic differential. The relatively small number of Ss and controls emphasizes the considerable problems regarding the methodological implications of such a study. Results have therefore been cautiously interpreted. 2 hypotheses are offered: (a) that the husband of a chronic female alcoholic has difficulty from the beginning of the marriage in realizing his male role and (b) that the partnership of the chronic female alcoholic is disturbed by a distortion of interpersonal perception.—*Journal abstract*.
2493. Calcedo Ordóñez, Alfredo & Rendueles Olmedo, Guillermo. (Dispensario de Psiquiatria e Higiene Mental, Cádiz, Spain) **[Illegitimacy and juvenile delinquency.]** (Span) *Actas Luso-Espanolas de Neurologia, Psiquiatria y Ciencias Afines*, 1974(Mar-Apr), Vol 2(2), 123-142.—Comments on case histories of 13 illegitimate institutionalized male juvenile delinquents. (English summary) (29 ref) —D. J. Clair.
2494. Chockalingam, K. (U Madras, India) **A study of recidivism in relation to extraversion.** *Indian Journal of Applied Psychology*, 1974(Jan), Vol 11(1), 12-13. —Administered the Eysenck Personality Inventory to 50 criminal recidivists and 50 nonrecidivists from 2 Indian jails to test the hypothesis that recidivists would be more extraverted than nonrecidivists. Results do not confirm the hypothesis, possibly due to the difficulty in eliciting true responses from respondents in a prison environment.—*Journal abstract*.
2495. Flournoy, Olivier. A discussion of David Roth's and Sidney Blatt's paper "Spatial representations of transparency and the suicide potential." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 295-296.—Comments on the paper by Roth & Blatt (see PA, Vol 55:Issue 2) emphasizing that transparency phenomena are as much an indication of anxiety as of depression, and signal the possibility of opening up new avenues for change.—L. Lauro.
2496. Freedman, David A. (Baylor Coll of Medicine, Texas Medical Ctr. Houston) **The battering parent and his child: A study in early object relations.** *International Review of Psycho-Analysis*, 1975, Vol 2(2), 189-198.—Suggests the use of data about battered children to draw inferences between presumed developmental causal experiences and observed end results. Studies of battered children are reviewed, the syndrome defined, and characteristics of the typical attack described. The syndrome is a transmissible entity with origins in the events of the 1st few postpartal months, and has been shown to recur in a single family in as many as 4 successive generations. (30 ref)—R. Tomasko.
2497. Humphrey, John A. (U New Hampshire) **Homicide, suicide, and role relationships in New Hampshire.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2789-2790.
2498. King, Gary T. (U Oklahoma) **A comparison of Hand Test responses of aggressive and non-aggressive Black adolescents.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1736.
2499. Lester, David & Beck, Aaron T. (Philadelphia General Hosp, PA) **Racial background and suicidal behavior.** *Psychology*, 1975(May), Vol 12(2), 3-5.—Studied 194 attempted suicides (96 White, 98 Black) admitted to a general hospital. Few differences between those of different racial groups were revealed, in contrast to H. Hendin's (1969) assertion that Black attempted suicides differ greatly from White. Some of the differences appeared to be a result of general differences in life style of different subcultures.—*Journal summary*.
2500. Malaviya, Pratibha. (Indian Inst of Technology, Kanpur) **Towards a theory of suicide.** *Indian Journal of Psychology*, 1973, Vol 48(4), 1-6.—Analyzed case histories of 20 schizophrenics, 5 psychotic depressives, 2 neurotics, and 20 normals having death wishes. They were classified under suicide committers, attemptors, and ideators. The role of crucial situational events in precipitating suicidal intent is emphasized.—B. Roy.
2501. Martín, García, José (U Complutense, Facultad de Medicina, Madrid, Spain) **[Psychopathological bases of dipsomania.]** (Span) *Actas Luso-Espanolas de Neurologia, Psiquiatria y Ciencias Afines*, 1974(Mar-Apr), Vol 2(2), 103-116.—Defines "dipsomania" as a "morbid and irresistible impulse to drink" and presents a "clinical-phenomenological" study based on "selected" hospital charts of 200 patients with 1st admissions for alcoholism. Epidemiological and case history data are summarized. Relationships between drinking and emotional stress are suggested. (55 ref)—D. J. Clair.

2502. Milebamane, B. mia Musunda. (U Québec, Trois-Rivieres, Canada) **[Perception of the childrearing attitudes and practices of the father by delinquents and normals.]** (Fren) *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 299-303.—Studied the perception by the child of the father's childrearing attitudes and practices, comparing 41 delinquent adolescents with 41 nondelinquents. The Parent-Child Relations Questionnaire of A. Roe and M. Siegelman (see PA, Vol 38:8099) and a story-telling test utilizing 2 cards from the TAT and 2 cards from a family-interaction test, were used to obtain data. The delinquent and the normal adolescents differed significantly ($p < .01$) on 5 of 10 Parent-Child Relations subscales and on 7 of 10 projective test measures. Delinquents were more likely to view their fathers as ineffective, negative, and pathogenic. (English summary) (33 ref)—F. Auld.

2503. Nicholson, Charles A. (United States International U) **A comparison of masculine role preference of scholastically successful and scholastically unsuccessful primary grade boys.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1708-1709.

2504. Ottenberg, Donald J. (Eagleville Hosp & Rehabilitation Ctr, PA) **Addiction as metaphor.** *Alcohol Health & Research World*, 1974(Fal), Exp Issue, 18-20.—Describes addiction as a means of survival for the addict, a way to endure feelings and situations that would otherwise be unbearable. The problem is in the person, not the substance. An addict is not cured by the death of other addicts, by fear of the law, by fear of hurting a loved one, or by experience. To work with addicts, whether of alcohol or drugs, it is essential to understand the nature of addiction; one must understand not only what the addiction does to the addict, but what it does for him. Like a 3rd person, the addiction stands between the therapist and the addict. Nonaddicts see addiction as negative and destructive, but it gives value, meaning, and purpose to the life of the addict himself, and only by substituting other values can a cure be effected.—J. Davis.

2505. Robbins, Lewis L. **Implications of a changing hospital population.** *Journal of the National Association of Private Psychiatric Hospitals*, 1974-1975(Win), Vol 6(4), 25-29.—Discusses social and psychodynamic factors which may contribute to the increase in the percentage of character disorders receiving psychiatric treatment in hospitals. The implications for in-hospital treatment of the dynamic constellation proposed are also discussed.

2506. Roth, David & Blatt, Sidney J. **Spatial representations of transparency and the suicide potential.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 287-293.—From clinical observation that mental representation of space is correlated with qualities of object relations and other clinical dimensions. 5 developmental levels of representational constancy were identified: boundary, relation, sequence, volume (or depth) and self-constancy. Reference is made to another study (in press) by the current authors in which the combination of relationship constancy and boundary constancy is examined. 2 case studies with transparent (i.e., cognitive manifestation of the combination of volume and sequence constancy) dream material and a controlled study of transparency and translucence in

Rorschach protocols of suicides are offered to support the hypothesis that transparency is associated with suicidal potential. Dynamic and developmental explanations are offered. (15 ref)—L. Lauro.

2507. Schaefer, Charles E. (Children's Village, Dobbs Ferry, NY) **The three wishes and future ambitions of emotionally disturbed boys.** *Devereux Forum*, 1975(Spring), Vol 10(1), 1-5.—Discusses the answers of 50 Black, lower-class delinquent boys 7-13 yrs old, prior to residential treatment, to the "Three Wishes" and "Future Ambitions" questions. Results were not significantly different from those obtained from normal children of comparable age.—W. Adams.

2508. Steffenhagen, Ronald A. (U Vermont) **Drug abuse and related phenomena: An Adlerian approach.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 238-250.—Uses Adlerian theory to present an explanation of gross multiple drug abuse. Drug abuse is considered a maneuver to protect one's self-esteem by allowing one to blame poor interpersonal, social, and academic performance on the drugs. The shift from drugs to political activism is a change from one form of compensation to another. Other topics considered include pseudohomosexuality, bisexuality, and attraction to the occult. Drug abuse is seen as an expression of the pampered life style, and successful therapy must work toward developing a modified life style based on reason and reality.—R. Tomasko.

Learning Disorders & Mental Retardation

2509. Boehm, Sue A. (U Houston) **The affect of three tints of red on the motor function of children with learning disabilities and of normal children.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1686.

2510. Boyle, Mary P. (Boston Coll) **The effect of structure on response productivity to thematic material: A comparison of retarded and nonretarded children.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1686.

2511. Colton, Ralph E. (U Idaho) **A study of pure tone thresholds and intelligence in institutionalized and non-institutionalized Downs Syndromes.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2420

2512. Evans, William N. **Pseudostupidity: A study in masochistic exhibitionism.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 619-632.—Proposes that most learning difficulties have little to do with native intelligence, but are examples of masochistic exhibitionism. Psychoanalytic literature has little to say about the topic because it is commonly unrecognized. Pseudostupidity is an emotional problem, and high intelligence can be a hindrance rather than a help to one who suffers from it. Pseudostupidity is not a state of not knowing, but a proclamation of ignorance when one does actually know. A number of clinical examples are presented and discussed at length to illustrate the intensity of the mechanism of denial. 2 characteristics are emphasized: the high degree of masochistic exhibitionism and the unconscious provocation which was originally directed against the mother.—G. S. Speer

2513. Greenhill, Nell J. (U Michigan) **The relationship between language categorization, and primary**

dyslexia. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1699.

2514. Greenlee, William E. (Ball State U) **A matched-pair design comparison of cognitive integrative functions between specific developmental dyslexics and adequate readers.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2422-2423.

2515. Holmes, Donald J. (Maricopa County Hosp. Glendale, AZ) **Disturbances of the preschool and very young school child.** *Journal of School Health*, 1975(Apr), Vol 45(4), 210-216.—Presents a general discussion of learning disabilities, with clinical examples, focused on attitudes toward the deficiencies and the affected child. The learning disabled usually have areas of functioning in which learning occurs more easily, but the deficiencies (mainly related to reading ability) lie in areas which are considered by others to be more important, so that the definition becomes somewhat arbitrary. Inability to learn reading is not significantly related to overall intelligence, and often represents a maturational lag. There are a variety of other factors which may promote secondary reading disabilities. Remedies should be addressed to the child's interests, motivations, assets, and learning developmental level.—J. D. Pauker.

2516. Kingsley, Ronald F. & Blixt, Sonya. (Kent State U) **An analysis of interests of delinquent and non-delinquent educable mentally retarded youth.** *Devereux Forum*, 1975(Spr), Vol 10(1), 20-25.—Investigated interests and activities of 36 delinquent and 22 nondelinquent, educable mentally retarded boys attending special classes and residing in the inner city. Based on reported interests it was found that group activities which were passive in nature differentiated the delinquent from the nondelinquent.—W. Adams.

2517. Thorp, Frank K. (U Chicago, LaRibida Inst) **A report of a presentation regarding learning disabilities from nutritional and learning points of view.** *Journal of the Association for the Study of Perception*, 1975(Spr), Vol 10(1), 39-40.—Describes the effects of malnutrition on brain cell development, and the consequent learning disabilities. Malnutrition prior to birth and during the 1st of life causes fewer and smaller brain cells and less myelin. These effects are permanent and irreversible. Malnutrition after the 1st year causes smaller cells, but this deficit can be corrected. Certain types of malnutrition cause such problems as decreased ability to focus on tasks and increased emotionality. It is suggested that a preventive program should seek to promote breast feeding and encourage breakfast and lunch programs, among other objectives.—J. M. Kleinman.

2518. Umetani, Tadao. **[A study on discrimination reversal: Shift learning as a function of MA in mentally retarded children.]** (Japn) *Japanese Journal of Educational Psychology*, 1975(Jun), Vol 23(2), 125-129.—Compared discrimination reversal shift in 37 mentally retarded children with 35 normal Ss matched for MA (5-9 yrs), and studied the effect of overlearning on reversal shift relative to the MA variation in the retarded Ss. A significant difference between retardates and normals was found for MA 5-6, but not for MA 7-9 ($p < .05$). The effect of overlearning in the retarded Ss was significant for MA 5-6 ($p < .05$).—S. Choe.

2519. Winters, John J. & Ward, Thomas B. (E. R. Johnstone Training & Research Ctr. Bordentown, N.J.) **The effects on induced passive rehearsal and the von Restorff phenomenon on the free recall of normals and retardates.** *Memory & Cognition*, 1975(Jul), Vol 3(4), 421-426. 36 noninstitutionalized retardates (mean CA, 11.9 yrs) and 36 normal children (mean CA, 8.03 yrs) of equal MA (approximately 8 yrs) listened to 11 orders of 20 nouns with no instructions to overtly or covertly rehearse. All Ss were in each of 3 list conditions: (a) when all words were at the same decibel (db) level, (b) when the 11th item was at a higher db level, and (c) when the items were repeated at the same db level using the rehearsal protocol of D. Rundus (1971). The normals' overall recall was superior to that of the retardates' recall. Repetition of items had no effect on the performance of either group except in the recency portion of the learning curve and on the initial trial for both groups and the 5th trial for the retarded group. The normal group was more susceptible to the von Restorff effect than was the retarded. Results are discussed in terms of the changing and different recall strategies of the 2 groups. (33 ref)—*Journal abstract*.

2520. Zemon, Allen L. (Catholic U of America) **Analysis of the defense mechanisms, frustration styles, and social organization patterns of the severely and moderately mentally retarded.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1146.

Speech & Language Disorders

2521. Aten, James L. (U Denver) **Auditory memory and auditory sequencing.** *Acta Symbolica*, 1974, Vol 5(2), 37-65.—Examines certain relationships between deficiencies in auditory memory of sequential stimuli and disturbances in language and learning ability for children with average or above-average learning potential. Stages in auditory processing and tests of auditory memory are discussed. Recent research is reviewed and suggestions for future testing and research are made. (50 ref)—M. Cynamon.

2522. Irwin, John V.; Huskey, Robert; Knight, Nancy & Oltman, Shirley. (Memphis State U) **A longitudinal study of the spontaneous remission of articulatory defects of 1665 school children in grades 1, 2, and 3: III. The study group.** *Acta Symbolica*, 1974, Vol 5(2), 9-17.—Presents data regarding 1,665 children who were tested on 13 phonemes in 3 word positions in the fall and spring of Grades 1, 2, and 3 (see PA, Vol 55:Issue 2). Results are reported on (a) degree of spontaneous remission, (b) correlation between number of errors on the first and last tests, and (c) different rates of spontaneous remission shown by 4 subgroups of Ss.—M. Cynamon.

2523. Irwin, John V.; Huskey, Robert; Knight, Nancy & Oltman, Shirley. (Memphis State U) **A longitudinal study of the spontaneous remission of articulatory defects of 1665 school children in grades 1, 2, and 3: II. The sample.** *Acta Symbolica*, 1974, Vol 5(2), 1-7.—Administered an articulatory test in the fall of 1967 to 15,000 1st grade children in the St. Louis School District. 3,147 were found to produce 1 phoneme defectively in at least 1 position. Of these, 327 were selected for therapy, and 2,820 were scheduled for fall and spring observation,

without therapy. for 3 yrs (study group). Of this nontherapy (study) group, 1,155 Ss were lost during the 3 yrs of the study, and 1,665 were observed for the full period. Results of analysis of variance of the first tests (fall 1967) are reported for the 3 groups: Study, Lost, and Therapy.—*M. Cynamon.*

Physical & Psychosomatic Disorders

2524. Ammon, Günter & Hameister, Hans-Joachim. [Ego-psychological and group-dynamic aspects of death and dying.] (Germ) *Dynamische Psychiatrie*, 1975, Vol 8(3), 129-142.—Repression and negation of death may be seen in our society as a manifestation of severe identity crisis. The dying patient is isolated from his group of fellows who try to escape the confrontation with death. There is a connection between pathological fear of death and its defense by individuals and society and a defective ego structure, which goes back to a disturbed ego development in a rigid primary group. Fear of death is essentially a fear of nonexistence, fear of the loss of the sense of self. This is demonstrated in a case study. The central problem of the dying person is the approaching separation from his group. When the dying person is isolated, it is a manifestation of the unconscious fantasies of omnipotence which make death an impairment of the power of the physician and a narcissistic insult; death is experienced as an aggressive selfish act of the dying one.—*H. Bruml.*

2525. Bauer, G. (U Innsbruck, Nervenlinik, Austria) [Mental alterations during continuous epileptic discharges.] (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1975, Vol 116(2), 241-255.—Summarizes the literature since 1927 reporting on psychological changes in patients with long-standing epileptic illness. Included are 11 case histories, 7 females 6-60 yrs old, median age 15, and 4 males 7-58 yrs old, median age 36. It is considered necessary to differentiate between postictal twilight states with or without sharp waves in the EEG. The term "minor epileptic status" contains several different epileptic conditions, especially petit mal status in cases of West or Lennox-Gastaut syndromes. It is suggested that a detailed description of the individual clinical picture is more informative than the global term "minor epileptic status."—*I. N. Mensh.*

2526. Devereaux, Michael W. & Partnow, Michael J. (Rancocas Valley Hosp. Willingboro, NJ) Delayed hypoxic encephalopathy without cognitive dysfunction. *Archives of Neurology*, 1975(Oct), Vol 32(10), 704-705.—Presents the case of a 20-yr-old male who, 3 days after an episode of hypoxia, developed profound motor deficit in the absence of behavioral or cognitive disturbance. Previous reviews of delayed hypoxic encephalopathy have stressed behavioral and cognitive disturbances as the initial symptoms. This patient's pyramidal tract dysfunction in the absence of higher cortical dysfunction serves to illustrate that delayed hypoxic encephalopathy is predominantly a white matter rather than a gray matter disorder.—*Journal abstract.*

2527. Dolle, Jean-Marie; Vinter, Shirley & Germain, Yves. (U Paris XIII, France) [Models of prehension-exploration and representative construction of spatial forms among hearing and hearing-impaired school age

children.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 836-843.—Tested the hypothesis that differences exist among hearing and hearing-impaired children in representing spatial structure. Ss were asked to copy 8 2-dimensional figures. Ss with partial hearing were less able than their hearing peers to construct spatial forms, and were found to follow a different developmental sequence in learning to represent space.—*Z. M. Cantwell.*

2528. Gnezditsky, V. V. & Arkhipova, N. A. (USSR Academy of Medical Sciences, Burdenko Inst of Neurosurgery, Moscow) [Application of some automatic control theory methods for the analysis of evoked potentials in parkinsonian patients.] (Russ) *Zhurnal Vysshei Nervnoi Deyatel'nosti*, 1974(Jan-Feb), Vol 24(1), 157-163.—Studied the effect of light and electrical cutaneous stimulation in central and occipital areas of the cerebral cortex on healthy human control Ss vs patients suffering from parkinsonism before and after ablation of different thalamic nuclei or administered L-Dopa. Evoked potentials (EP) were recorded and computer analyzed by the synchronous accumulation technique. Parameters studied were based on the concepts of automatic control theory and showed that treatment resulted in bilateral changes of EP configuration and that treatment of parkinsonian patients is influenced by regulatory processes. Dynamics of regulatory processes due to changes in the cortico-subcortical relationships are discussed. (English summary) (16 ref)—*L. V. Majovski.*

2529. Klein, Donald F. & Gittleman-Klein, Rachel. (Long Island Jewish-Hillside Medical Ctr. Glen Oaks, NY) Problems in the diagnosis of minimal brain dysfunction and the hyperkinetic syndrome. *International Journal of Mental Health*, 1975(Spring-Summer), Vol 4(1-2), 45-60.—Conducted a study with 155 children in an attempt to identify those who were "pervasively hyperactive." Since school was the usual source of complaint of hyperactivity, only children who showed hyperactivity in at least 1 other setting besides the school were selected. A scale was used to reflect activity at home, and Ss' mothers and a social worker completed an evaluation on Ss. On 11 items, scored on a 5-point scale, the child had to obtain a minimum score of 28 (of a possible 44) to be considered hyperactive at home. Among the children who were evaluated as hyperactive, some of them had such severe family pathology as to give the impression that the child had an adjustment reaction. It is pointed out that when diagnosing hyperactivity, cultural factors cannot be ruled out since there may be subcultural standards for activity level at variance with general standards. It is suggested that minimal brain dysfunction children can be improved with treatment by pharmacotherapy.—*A. H. Alawi.*

2530. Kramer, Milton; Roth, Thomas & Trinder, John. (VA Hosp. Cincinnati, OH) Dreams and dementia: A laboratory exploration of dream recall and dream content in chronic brain syndrome patients. *International Journal of Aging & Human Development*, 1975, Vol 6(2), 169-178.—7 mild and 10 severe chronic brain syndrome male middle aged patients were tested in the sleep laboratory for dream recall and content. The mildly organic patients had 5% recall while the severely

organic patients had 35% recall. An additional 4 severely organic aged patients showed a recall rate of 8%. The difference between the recall rates in mildly and severely organic middle-aged patients was not statistically significant. The difference between the recall rates of the aged severely organic patients and either or both of the middle-aged groups was statistically significant ($p < .001$). Dream content differences were found between the mildly and severely organic middle-aged groups and between the combined group and normal young males.—*Journal abstract.*

2531. Marder, Michael Z. & Schwartz, Fred. (Columbia U, School of Dentistry & Oral Surgery) **Somatic compliance and hyposalivation: Physiological considerations.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 633-636.—Comments on R. B. Little's discussion (see PA, Vol 49:5101) of the psychodynamics of xerostomia, or hyposalivation. The concept of hyposalivation as a purely psychogenic disorder is not rejected, but it is felt that this condition can also result from physiological causes. A number of conditions where an existing or potential physiological mechanism might cause hyposalivation are discussed briefly.—G. S. Speer.

2532. Markson, Jordan Q. (Boston U) **Response to traumatic surgery in the light of cognitive dissonance theory.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1622.

2533. Montagu, J. D. (MRC Clinical Psychiatry Unit, Graylingwell Hosp, Chichester, England) **The hyperkinetic child: A behavioural, electrodermal and EEG investigation.** *Developmental Medicine & Child Neurology*, 1975(Jun), Vol 17(3), 299-305.—Compared 10 hyperkinetic children with a matched group of normal controls on the basis of behavioral measurements, electrodermal recordings, and spectral analysis of the EEG. Total motor activity, speed of movement, and noisiness differentiated the 2 groups. No significant differences were found in skin admittance level and EEG alpha rhythm propagation time. Best differentiation was found in EEG coherence function. (French, German, & Spanish summaries)—P. W. Pruyser.

2534. Morimatsu, Mitsunori; Hirai, Shunsaku; Muramatsu, Atsushi & Yoshikawa, Masaki. (U Gunma, Medical School, Inst of Neurology & Rehabilitation, Maebashi, Japan) **Senile degenerative brain lesions and dementia.** *Journal of the American Geriatrics Society*, 1975(Sep), Vol 23(9), 390-406.—Results of a study of brain lesions—including Alzheimer's neurofibrillary changes, senile plaques, and amyloid angiopathy—show that the incidence and quantity of neurofibrillary changes and senile plaques rose with age and that an approximate positive correlation in quantity was noted among the 3 kinds of degenerative change. The cause of dementia was studied retrospectively, and findings are presented. (46 ref)

2535. Müller, Peter. (U Göttingen, Nervenkl. W Germany) **[Schizophrenia and brain tumor: Case report on differential diagnosis.]** (Germ) *Nervenarzt*, 1975(Feb), Vol 46(2), 64-67.—Reports 2 cases of oligodendroglioma initially diagnosed as schizophrenias. (20 ref)—J. Rutschmann.

2536. Parra, Manuel; Schilkruif, Raúl; Morales, Emilio & Serrano, María, E. (U Chile, Hosp Clínico, Santiago)

[Psychiatric and neurosurgical aspects of communicating hydrocephalus.] (Span) *Actas Luso-Espanolas de Neurologia, Psiquiatria y Ciencias Afines*, 1974(Mar-Apr), Vol 2(2), 117-122. Reviews histories of 7 hospitalized cases of communicating hydrocephalus with normal intracranial pressure. Aspects of etiology, treatment, and prognosis are discussed. (English summary)—D. J. Clair.

2537. Raghuram, Thummalala C. & Krishnaswamy, Kamala. (National Inst of Nutrition, Hyderabad, India) **Serotonin metabolism in pellagra.** *Archives of Neurology*, 1975(Oct), Vol 32(10), 708-710. Evaluated the mental status of pellagrins in relation to the neurohormone, serotonin or 5-hydroxytryptamine (5-HT). Levels of 5-hydroxyindoleacetic acid (5-HIAA), an end product of serotonin in the urine and cerebrospinal fluid (CSF), and of platelet 5-HT were determined in a group of pellagrins and in normal Ss. Results indicate that the 5-HT concentration was reduced in platelets and 5-HIAA excretion in urine was below normal levels. The 5-HIAA concentration in CSF was also reduced, suggesting a decrease in 5-HT functional activity in the brain.—*Journal abstract.*

2538. Rapoport, Judith L. & Quinn, Patricia O. (Georgetown U, Medical School) **Minor physical anomalies (stigmata) and early developmental deviation: A major biologic subgroup of "hyperactive children."** *International Journal of Mental Health*, 1975(Spring-Summer), Vol 4(1-2), 29-44.—Summarizes a series of ongoing studies on the minor physical anomalies and hyperactivity in children. 82 hyperactive males and their siblings were surveyed for stigmata. The children's stigmata score had a significant positive relationship to reports of paternal hyperactivity. The present investigation supports the notion that minor anatomic anomalies are significant measures among behaviorally deviant children reflecting minor developmental defects of the CNS. The recognition of this group of children will not lessen the incidence of hyperactivity. However, it may serve to sharpen diagnostic efforts, alleviate unnecessary guilt feelings and thus potentially enable the identification of a specific drug-responsive subgroup. Follow-up data suggest that some adolescent offenders may have had restless, distractible symptoms similar to those of minimal brain dysfunction. (29 ref)—A. H. Alawi.

2539. Reimer, Donald R.; Mohan, Jagan & Nagaswami, Supramoney. (VA Hosp, Topeka, KS) **Temporal lobe epilepsy as a probable manifestation of limbic system dysfunction.** *Bulletin of the Menninger Clinic*, 1975(Jul), Vol 39(4), 357-363.—Notes that limbic system dysfunction has 2 possible causes: either the limbic system has become pathologically hyper- or hypoactive due to lesion or stimulation, or the neocortical involvement has become abnormal. Brain disease, acquired or congenital, can bring about limbic dysfunction, which can result in uncontrollably violent behavior, hyper- or hyposexuality, intense fear and rage, schizophrenic-like psychosis, or multitudes of neuroendocrine hyper- or hypofunction. Structural limbic systems dyscontrol may be identical to functional temporal-lobe epilepsy dyscontrol syndromes as demonstrated by the EEG findings. An illustrative case is presented which was refractory to psychotherapy but responded excellently to dilantin. (23 ref)—J. Z. Elias.

2540. Roeser, Ross J.; Campbell, John C. & Daly, David D. (Callier Ctr for Communication Disorders, Dallas, TX) **Recovery of auditory function following meningitic deafness.** *Journal of Speech & Hearing Disorders*, 1975(Aug), Vol 40(3), 405-411.—Presents 2 cases that document improvement in hearing following *Hemophilus influenzae* meningitis. In both cases, 2 3-yr-old girls, vestibular function was permanently lost. The possible anatomical and physiological sites of involvement are discussed. The 2 cases stress the importance of regularly scheduled audiometric reevaluation in cases of postmeningitic deafness.—*Journal abstract*.

2541. Rosenthal, Sol R. (Research Foundation, Chicago, IL) **Risk exercise and the physically handicapped.** *Rehabilitation Literature*, 1975(May), Vol 36(5), 144-149.—Studied the physical and mental reactions of physically handicapped children during and after horseback riding in centers here and abroad. In addition to the pleasure derived, the experience was found to increase mobility, motivation, and courage. Because the study was based on subjective impressions, more objective research is proposed.—S. L. Warren.

2542. Shamley, D. A. (U Cape Town, South Africa) **The personality dynamics of blind and sighted adolescents.** *Journal of Behavioural Science*, 1974, Vol 2(2), 73-80.—Hypothesized that totally blind adolescents will, by the very nature of their handicap, present significantly more personality difficulties than normal adolescents in the areas of aggression, sex, rejection-acceptance, and anxiety about present and future achievements. The Thematic Auditory Apperception Test, consisting of 10 sound sets, was constructed and administered to 50 sighted and 50 blind adolescents matched for IQ, age, and sex. H. A. Murray's scoring system for the TAT was used. Significant differences were found between the experimental and control groups. Blind Ss scored significantly higher on externalized aggression, aggression directed against the Hero, sexual responses in keeping with the moral codes of society, inadequacy responses, and acceptance responses. Results pose serious problems for the blind themselves, educators of the blind, and society in general.—*Journal abstract*.

2543. Thiery, E.; Verwerft, E. & vander Eecken, H. (Akademisch Ziekenhuis, Neurologische Kliniek, Ghent, Belgium) **The Elizur Test of Psycho-organicity (adults): A cross-validation study.** *Acta Neurologica Belgica*, 1975(Mar-Apr), Vol 75(2), 93-98.—Administered to 96 adults a combined test used for the diagnosis of organic brain condition, in an effort to cross-validate the Elizur Test of Psycho-Organicity. Results show the test can differentiate the "organic" and "nonorganic" groups in a statistically significant manner. 85% of the organics and 81% of the nonorganics were correctly identified. In addition, there was a significant correlation between the test findings and the EEG and radiographic results. It is concluded that this test used in a battery of neuropsychological tests is practical and valuable. (French summary)—*Journal abstract*.

2544. Thumin, Fred & Wims, Earl. (U Missouri, St Louis) **The perception of the common cold, and other ailments and discomforts, as related to age.** *International Journal of Aging & Human Development*, 1975, Vol 6(1), 43-49.—Administered a questionnaire to 456

normal 18-82 yr old adults concerning the frequency and duration of their colds, their symptoms and treatments, and the perceived severity of various discomforts. Though older Ss were found to suffer more than younger with body aches, the former had less difficulty with a variety of other physical and psychological symptoms and contracted relatively few colds. Older Ss treated their colds less often with Contac and Dristan but more often by staying home and/or calling their doctor. As compared with younger Ss, older Ss perceived intestinal flu to be relatively less serious, but earache, sprained toe, indigestion, having a tooth filled, stiff neck, and hangover to be relatively more serious.—*Journal abstract*.

2545. von Kries, Dietrich. (Deutschen Akademie für Psychoanalyse, Frankfurter Lehr- und Forschungsinstitut, W Germany) **[Psychosomatic syndromes as a problem of ego-regulation.]** (Germ) *Dynamische Psychiatrie*, 1975, Vol 8(3), 171-177.—Psychosomatic disturbances may be seen as a problem of an archaic ego structure being incapable of delimiting itself. In such patients, the boundary of the body-ego as the region where both outer and inner objects are experienced emotionally is defective. Psychosomatic symptoms constitute the boundary of a reparative ego-space by which the defective body-ego-boundary is replaced. They may be antecedent of an introject and, simultaneously, the place where emotional experiences occur. Conclusively a 2nd group of psychosomatic disturbances is presented and related to Meng's concept of organ psychosis. These diseases may be seen as somatically fixated autistic reactions.—H. Bruml.

2546. Wender, Paul H. (U Utah, Medical Coll) **Speculations concerning a possible biochemical basis of minimal brain dysfunction.** *International Journal of Mental Health*, 1975(Spring-Summer), Vol 4(1-2), 11-28.—Minimal brain dysfunction (MBD) is one of a number of designations for a common behavioral syndrome of childhood which takes a variety of forms, including impairments in visual and auditory discrimination, spatial relations and abstractions. 2 hypotheses regarding this designation are advanced: (a) MBD is a family of disorders which is quite broad and whose boundaries are very unclear, and (b) that it is a genetic disorder of monoamine metabolism. Results of 2 naturalistic studies suggest the possibility of biochemical enzyme deficit. I. B. Holman (1922) suggested that there is a relationship of MBD to von Economo's encephalitis. In a study by P. H. Wender, a remarkable response of MBD children to drugs was found. Hypothesizing that MBD is a genetically produced disorder suggests some indirect means for the assessment of monoamine metabolism. These are measurement of urinary monoamine metabolites, tests of the cerebral spinal fluid, tests of altered autonomic nervous system reactivity, administration of drugs with known specific actions, and administration of amine precursors and blockers of amine synthesis (40 ref)—A. H. Alawi.

TREATMENT AND PREVENTION

2547. ———. **A 25-yr review of mental health research: Highlights of a report from NIMH** //

Community Psychiatry, 1975(Nov), Vol 26(11), 711-715.

—Presents a brief overview of a National Institute of Mental Health (NIMH) report on its research activities since 1948. Topics discussed include NIMH research in psychopharmacology, treatment methods, and mental health services, and issues related to the dissemination of research findings and the awarding of funds and grants.

2548. Arnot, Robert E. (St Elizabeth's Hosp, Brighton, MA) **Observations on the effects of electric convulsive treatment in man: Psychological.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 499-502.—Summarizes observations made over a 30-yr period on the psychological changes observed during the use of electroconvulsive therapy (ECT). It is maintained that the major factor in producing the effects of ECT is the interruption of the ongoing CNS circuits. The convulsion and subsequent coma disrupt these ongoing patterns, and a "silent period" can be noted by EEG. It is also held that the improvements seen depend on the convulsion rather than on suggestion or other factors associated with the treatments. Mental illnesses and symptoms which are aided by ECT are discussed, along with the following observations on the effects of ECT in man: (a) An immediate, recent memory loss is produced. (b) The ongoing abnormal mental processes are interrupted. (c) The ongoing normal, but in the psychiatric patient intensified and perseverated, mental processes are interrupted. (d) The deviated mood is corrected toward normal, either from the depressed or the manic side. (e) A generalized state of well-being is produced. (f) In some patients a state of disorientation and confusion develops. (17 ref)—M. E. Pounsel.

2549. Bloom, Bernard L. (U Colorado) **Changing patterns of psychiatric care.** New York, NY: Human Sciences Press, 1975. 360 p.

2550. Burleigh, Allison C. & Messick, Janice M. (Brentwood VA Hosp, Los Angeles, CA) **Drawing on concepts from other fields.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 735-736.—Presents a list of books that provide fundamental information about program evaluation and related areas (e.g., management and educational research). The multidisciplinary nature of outcome assessment theory and techniques is noted.

2551. Butler, Robert N. (Washington School of Psychiatry) **Successful aging.** *MH*, 1974(Sum), Vol 58(3), 6-12.—Discusses the psychology of aging and its attendant problems such as cultural attitudes, myths, and stereotypes. It is suggested that this period can be a time of unifying experience. 2 types of specialized psychotherapy—life review therapy and life cycle group therapy—are discussed.—B. E. Allen.

2552. Cartwright, Rosalind D. & Weiss, Marc F. (U Illinois, Chicago Circle) **The effects of electrosleep on insomnia revisited.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 134-137.—In a previous study by M. F. Weiss (see PA, Vol 51:9582), 10 Ss who had suffered from sleep onset insomnia for a minimum of 2 years were used to study the effects of electrosleep on this disorder. The present study reports a 2-yr follow-up of these Ss. Of the 5 Ss who received 24 live treatments, 4 appeared to be able to fall asleep with little difficulty and to awake feeling moderately to very well rested. Only one

appeared to have relapsed during the 2-yr no-treatment period. Of those receiving sham treatment 4 were having quite a bit of difficulty falling asleep but 3 of the 5 awoke feeling moderately well rested. Although the number of Ss is small, the trends appear consistent with the interpretation that sleep habits were improved for most of the real treatment Ss and for few of those receiving sham treatment.—*Journal abstract*.

2553. Endicott, Jean & Spitzer, Robert L. (New York State Psychiatric Inst, Biometrics Research, New York) **Designing mental health studies: The case for experimental design.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 737-739. Discusses 3 critical issues in determining the design of an evaluation study of patient outcome: (a) whether the design should be experimental or naturalistic; (b) whether all the patients in the treatment programs should be studied or only specially selected samples; and (c) whether the evaluations be made by the patients' therapists in the course of treatment or by independent assessors. It is concluded that optimal evaluation of the differential effectiveness of treatment programs includes an experimental design, sampling based on specific inclusion and exclusion criteria, and the use of an independent assessment team.

2554. Grosser, George H.; Pearsal, Doris T.; Fisher, Cindy L. & Gegemonte, Lois. (Massachusetts Dept of Mental Health, Research & Evaluation, Boston) **The regulation of electroconvulsive treatment in Massachusetts: A follow-up.** *Massachusetts Journal of Mental Health*, 1975(Spr), Vol 5(3), 12-25.—Examined data from 23 public, private, and Veteran's Administration mental health facilities that provided electroconvulsive therapy (ECT) to 2,441 patients in a 1-yr period. 90% of all reported cases were provided by the private facilities, suggesting major differences in treatment philosophies, administrative policies, and fiscal concerns. Private hospitals are suggested to use ECT in certain diagnostic groupings in which this treatment may not be the most efficacious, while the public hospitals fail to use the optimum treatment resources for a number of patients. The effectiveness of the data reporting system used to monitor ECT in Massachusetts is noted.—R. Tomasko.

2555. Henderson, James. (Private practice, Barrie, Canada) **Object relations and a new social psychiatry: The illusion of primary prevention.** *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 233-245.—Advances the thesis that if community psychiatry is to survive as a concept, let alone as a specialty, its theoretical bases and practical methodology need to be strengthened; that social psychiatry as currently conceived is too feeble to offer much hope of rescue; but that the object relations viewpoint in social and community work may offer some help in understanding the sociopathology of civilization. The danger is that early commitment to psychiatric prevention may obstruct the development of generations of future psychiatrists and mental health professionals. The prevention idea may well prove premature, and society will be justly angry that psychiatrists have failed to carry out their primary clinical mandate.—J. Z. Elias.

2556. Horwitz, Betty L. (Columbia U) **Effects of CO₂ inhalation of selected oral language performances of**

aphasic adults. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1735-1736.

2557. Keenan, Brian. (US General Accounting Office, Washington, DC) **Designing mental health studies: The pragmatics of nonexperimental design.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 739-740. —Argues against the use of experimental designs in evaluation studies, and discusses reasons why nonexperimental designs (e.g., naturalistic studies) are an integral part of the scientific method. Constraints that are built into experimental designs are discussed, and the need for flexibility in outcome assessments is considered.

2558. Keenan, Brian. (US General Accounting Office, Washington, DC) **Essentials of methodology for mental health evaluation.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 730-733. —Describes 9 separate areas or procedures that must be used by clinicians or administrators conducting evaluation studies (e.g., evaluation theory, hypothesis development, study design, sampling, indicator development, and reliability and validity assessments). Major references on evaluation are commented upon, and cautions in data analyses are discussed. (16 ref)

2559. Lindsey, Duncan. (West Virginia U, School of Social Work) **Behaviorist versus sociologist in the mental health field.** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1975, Vol 21(2), 8-11. —Examines attempts by behavioral psychologists and sociologists to determine what the appropriate treatment should be of deviant and perhaps disturbed persons who are placed in the custody and care of the mental health profession. 2 case studies are presented to illustrate the accomplishments of behavioral modification programs and chemotherapeutic treatment. Also discussed are (a) issues related to research on the sociology of deviance, and (b) the use of mental health (behavioral) technology to create cooperative and conforming individuals out of those who question societal demands and behave in what prominent others would describe as deviant manners. —J. Sorokac.

2560. Lorei, Theodore W. & Schroeder, Nancy H. (VA Central Office, Washington, DC) **Integrating program evaluation and medical audit.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 733-735. —Discusses 4 basic issues in program evaluation and medical audit (outcome, process, structure, and efficiency). The nonindependence of program and evaluations and medical audits is discussed, and implications for corrective actions that are identified by the evaluation or audit are considered.

2561. Mahoney, Kurt. (Arizona State U) **Frequency and quantity of nocturnal urinary emissions after diurnal toilet training and after training to restrain reflex voiding in children.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1705.

2562. Marjerrison, G.; James, J. & Reichert, H. (U Saskatchewan, Saskatoon, Canada) **Unilateral and bilateral ECT: EEG findings.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 257-266. —Used delta content of EEG as an indicator of the physiological effect of ECS in 52 psychiatric patients with various diagnoses who had been assigned to ECS treatment. 29 patients were randomly assigned to electrode placement

and 23 to unilateral, nondominant-side placement. Bilateral ECS produced more delta content than unilateral ECS. ECS caused more delta content in the 17 schizophrenics than it did in the 19 endogenous depressives. Unilateral ECS produced greater variance of EEG potentials in the depressive patients, but not in the schizophrenics. (French summary)—F. Auld.

2563. Markson, Elizabeth W. (Massachusetts Dept of Mental Health, Research & Education, Boston) **Evaluation in mental health: Why and how.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 727-730. —Discusses major reasons for doing human services research and evaluation and characteristics of the 2 major types of evaluation (on-going analyses of day-to-day activities and research-oriented assessments of the impact of a given program). Types of outcome assessments, methods of data analysis, and implications for administrative accountability are discussed, and an annotated list of references on evaluative techniques and statistical procedures is included.

2564. Miller, Milton H.; Miles, James E. & Klein, Marjorie. (U British Columbia, Vancouver, Canada) **Quality control in psychiatric treatment: One hundred percent well in three weeks or the doctor says "why."** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 267-272. —Argues that difficulties in predicting which treatment will work best for a particular patient makes it necessary for the therapist to reassess at frequent intervals whether the treatment he is using is the most appropriate. (French summary)

2565. Stockdill, James W.; Sharfstein, Steven S. & Reich, Muriel. (NIMH, Program Development & Analysis, Rockville, MD) **Keeping evaluation questions on a realistic level.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 736-737. —Suggests that carefully delineated questions about discrete program areas or functions yield the most useful information in evaluations and that the distinct properties of structure, process, and outcome components should be emphasized by primarily focusing on one area or function. Questions should also be keyed closely to the nature of the program and the nature of the management or policy decision for which the study will provide information.

2566. Stone, Alan A. (Harvard U, Faculties of Law & Medicine) **Psychosurgery in Massachusetts: A task force report.** *Massachusetts Journal of Mental Health*, 1975(Spring), Vol 5(3), 26-46. —Discusses the regulation of psychosurgery after the decision to use it is made. The use of surgical techniques to treat mental illness is considered either clinical investigation or experimentation. A system of state review of psychosurgical procedures performed in Massachusetts hospitals is proposed. Steps recommended to be followed in obtaining informed patient consent include description of how the procedure is to be performed, the risks involved, the benefits to be derived, available alternatives, follow-up procedures, and notification of the ability to rescind consent at any time without penalty. A minority report recommending the state not be involved in a case-by-case decision making process is also presented. —R. Tomasko.

Psychotherapy & Psychotherapeutic Counseling

2567. **Alherti, Alberto.** The will in psychotherapy. *Psychosynthesis Research Foundation*, No 35, 11 p.—Discusses the rediscovery of the importance of the will in psychosynthesis. Psychosynthesis sees psychotherapy, not as a retrograde path leading to the causes of the current illness, but as a progressive movement toward a cure. The primary aspect of the will in therapy is manifested in the patient as "the will to be cured" and in the therapist as "the will to aid." Detachment and objectivity on the therapist's part are ruled out in favor of participation and subjectivity. The patient is made to feel he is a subject that can act rather than an object who reacts. An important aspect of "being cured" is learning how to forge bonds with others. A clinical example is presented.—*R. Tomasko.*
2568. **Amaral, Lygia.** A discussion of the paper by T. L. Dorpat on "Internationalization of the patient-analyst relationship in patients with narcissistic disorders." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 189-191.—In reference to Dorpat's paper (see PA, Vol 55:Issue 2), it is maintained that the process of identification of the patient with the analyst is crucial to the patient's developing a clear identification between psychic and external realities.—*L. Lauro.*
2569. **Armony, Nahman.** (Inst de Medicina Psicologica, Rio de Janeiro, Brazil) **Countertransference: Obstacle and instrument.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 265-281.—Points out that countertransference (CT), originally considered as an obstacle to analysis, has come to be regarded as an instrument of the analyst's work. A distinction is made between fantasy reality or "parataxic level" and objective reality or "syntactic level," which represent analyst-analysand relationships; each level is further subdivided. The concepts of autogenic CT, allogenic CT, complementary identification, and concordant identification are explained and illustrated with examples from therapy. Both autogenic and allogenic CT are analyzed in terms of whether the fantasies involved are conscious or unconscious, acted out or not acted out, and the degree of susceptibility of arousal of the fantasies. The conditions under which the 2 types of CT may constitute obstacles to analysis are indicated. (21 ref)—*M. J. Stanford.*
2570. **Badaracco, Marie R.** (Karen Horney Psychoanalytic Inst. New York, NY) **Psychoanalysis as altering states of consciousness.** *Journal of the American Academy of Psychoanalysis*, 1975 (Apr), Vol 3(2), 205-210.—The process of psychoanalysis is compared to meditation with both involving an interweaving of the individual's needs and capacities for effort and relaxation. Both effort and relaxation are necessary, reinforcing experiences of life, and are developed in psychoanalysis through the facilitation of altered states of consciousness. A clinical example is presented illustrating a compulsive and isolated capacity for effort gradually becoming tempered by a desire for relaxation. The patient moved to an altered awareness of himself as a person able to control his work and to experience a rest he felt denied because he was male. Intrapsychic and interpersonal processes are considered complimentary.—*R. Tomasko.*
2571. **Berry, Gail W.** (Mt Sinai School of Medicine, City U New York) **Incest: Some clinical variations on a classical theme.** *Journal of the American Academy of Psychoanalysis*, 1975(Apr), Vol 3(2), 151-161.—Presents 7 clinical cases to illustrate 4 incest variations: incest and homosexuality, brother-sister incest, incest as a transmissible phenomenon, and incest envy. The findings question whether incest is as uncommon as classical psychoanalytic theory implies. A real act of incest is considered as much a psychic reality as a fantasied one. Superficially benign incestuous experiences between siblings may intensify unresolved oedipal wishes into a preconscious incest expectation with the subsequent disappointment experienced as narcissistic injury. The identification of, and intervention with, preincestuous children, identifiable in relation to an incest carrier, is encouraged. Incest envy is noted to generate greater psychological damage than direct involvement.—*R. Tomasko.*
2572. **Bicudo, Virginia L.** A discussion of the paper by H. S. Klein on "Transference and defence in manic states." *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 269-271.—Agrees with Klein (see PA, Vol 55:Issue 2) that manic patients use massive projection in the transference to contain their intolerable anxiety, but suggests more complete use of W. Bion's (1965) approach. The integrative function of manic defenses are discussed.—*L. Lauro.*
2573. **Bodenheimer, A. R.** (Tel-Aviv U, Medical School, H. Sheba Medical Ctr, Israel) **[Psychotherapy: This side of freedom and dignity.]** (Germ) *Psychotherapie Medizinische Psychologie*, 1975(Jul), Vol 25(4), 109-123.—Discusses psychotherapeutic experience acquired in Israel in conditions of stress due to the threatening effects of war. Specific disorders seen as war neuroses and psychogenic reactions show, during treatment, why a cure will only be possible when related to freedom and upholding of human dignity. In psychotherapy, moral indignation and condemnation of the patient are considered out of place. Treatment will have a chance of success only when the patient's freedom is restored and his personal dignity is not interfered with. The concepts of "adequate cure" and "conscious health" are defined. A typical case history is presented to show that psychotherapy which respects freedom and dignity may render possible access to a relationship with an otherwise inaccessible personality.—*S. D. Babcock.*
2574. **Breton, Jean-Jaques; Briones, Luis; Lemyze, Pauline & de la Durantaye, Andrée.** (Hôpital Ste-Justine, Montreal, Canada) **[Evaluation of child psychiatric care: Results of an exploratory study.]** (Fren) *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 201-208.—Reports on a follow-up of 265 cases closed during 1971 by a psychiatric team at Sainte-Justine Hospital. Replies to 117 questionnaires returned by parents of the child patients showed that the parents understanding of the treatment process had an important impact on the continuation of the child in treatment. (English summary)
2575. **Bryant, Brenda & Waterman, Jill.** (U California, Davis) **Factors relevant to treatment assignment of mothers seeking therapy.** *International Mental Health Research Newsletter*, 1975(Sum), Vol 17(2), 1, 11-12.

—Examines factors relevant to psychotherapy with mothers. Research has suggested that therapist gender is less important than therapist theoretical orientation. Psychoanalytic therapists see women as passive; women's groups, behaviorists, and Rational Emotive therapists encourage active, assertive roles; existentialists advocate individually determining a balance between traditional and nontraditional female roles. To promote client responsibility and awareness, (a) mothers seeking therapy should receive information regarding different value orientations available in therapy; (b) therapists should clearly understand their own value orientations toward women; and (c) therapists and clients should together determine to what extent therapist gender is important. (21 ref)—C. A. Heikkinen.

2576. Chediak, Charles. (Menninger Foundation, Topeka, KS) **Technical modification during psychoanalytic impasse.** *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 222-232.—Modifications of classical psychoanalytic techniques are often necessary to assist in attaining therapeutic goals. An illustrative case study is presented in which a long impasse was overcome by abandoning the patient's recumbent position.

2577. Chrzanowski, Gerard. (William Alanson White Inst, New York, NY) **The way things are: In psychoanalytic training and practice.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 332-348.—Describes personal experiences and views concerning the practice and teaching of psychoanalysis as of 1963, when this paper was presented. Illusory concepts of the psychoanalytic process are pointed out, with emphasis upon reciprocal expectations of the participants and the significance of their respective value orientations. An appeal is made for strengthening, advancing, and vitalizing practice and teaching of psychoanalysis with recommendations for a thoughtful and sensitive application of role theory. The significance of mental health as a focal consideration of organized human behavior must be fully understood. Analysis would then have a dual function: (a) to use theory and practice more effectively in the fight against mental illness, and (b) to use analysis as a tool in promoting person-to-person intimacy.—M. J. Stanford.

2578. Compton, Allan (Ed). **Aspects of psychoanalytic intervention.** In B. D. Fine & H. F. Waldhorn (Eds), *Alterations in defenses during psychoanalysis. Aspects of psychoanalytic intervention*. New York, NY: International Universities Press, 1975. xi, 97 p.—Patient examples and a literature review are used to discuss the theory of psychoanalytic technique. 2 intervention aims are considered, preparatory and those involving interpretative reconstruction, and 3 types of intervention responses are noted: recognition and recall, integration, and insight. (4 p ref)

2579. Curtin, Thomas G. (Boston U, School of Education) **The relationship between transcendental meditation and adaptive regression.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1696.

2580. de Vriese, Edith. [The dynamics of a therapy by directed reverie.] (Fren) *Etudes Psychotherapiques*, 1974(Dec), No 18, 209-226.—Describes in detail the therapy of Guido, a 29-yr-old man suffering from anxiety, contractions in the solar plexus and shoulders, indecision, need to prove himself sexually, poor sleep,

difficulty paying attention, and bad memory. Guido presented himself as gentle and unaggressive. After 43 sessions of therapy (19 of them involving directed reverie) over 14 mo, his conflicts had abated and his presenting symptoms had disappeared; he felt liberated and able to face life.—F. Auld.

2581. Donovan, D. M. **Some thoughts on being and having.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 12-13.—A distinction is made between *having* and *possessing*, the former being related to being and the latter to various forms of psychopathology. Within the therapeutic experience a transition from *possessing* to *having* is seen as necessary. The idea of *insight* is related to a recognition of this transition and, ultimately, to the realization of one's own death. Suicide is briefly considered in this context. (French summary)

2582. Dorpat, T. L. **Internalization of the patient-analyst relationship in patients with narcissistic disorders.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 183-188.—Presents a clinical study of the role of the internalization of the patient-analyst relationship in the repair of developmental defects in 5 patients with narcissistic disorders. The study integrated and correlated events occurring within analytic hours with reports of fantasies patients had about the analyst outside of analytic hours. The internalization of patient-analyst transactions is described as including 2 transformations: (a) replication of patient-analyst transactions in patients' analyst introject fantasies, especially the deferred imitation in fantasy of the analyst's observational and interpretive activities and (b) the patient's development of new and improved ego and superego functions through selective identifications with the object representation of the analyst.—*Journal summary*.

2583. Dufour, Roger. [The relationship of investment in the dream.] (Fren) *Etudes Psychotherapiques*, 1975(Mar), No 19, 19-27.—Defines the "relationship of investment in the dream" as a sharing by patient and therapist in a common instrument of observation. In directed-reverie therapy the patient creates a dream in the presence of the therapist; therefore the dreaming process can be directly observed and understood. This clarifies the connections between fantasy and reality, between external object and internalized object. The patient's relationship to another person, to himself, and to his fears of castration, of death, and of the alien, are revealed to the patient's and therapist's joint observation. (Spanish & Portuguese summaries)—F. Auld.

2584. Elsenberg, Alice. [Some reflections on a therapy by directed reverie: The therapy of Marie Clotilde.] (Fren) *Etudes Psychotherapiques*, 1975(Mar), No 19, 29-31, 34-37.—Uses R. Desoille's classic case of Marie-Clotilde as a basis for discussing the dynamics of directed reverie therapy. 3 dreams from the beginning, the middle, and the end of the therapy show the evolution of (a) masculine and feminine images, (b) identification, fusion, and projection, and (c) the therapist's relationship with the patient, and the patient's awareness of her own problems. It is noted that Desoille's therapy was done in a way that was more result than the deep, unconscious work of the patient. The therapy seemed to end in an acceptance

of death rather than in Marie-Clotilde's accepting her own desires and her sexuality, which would have made her open to life. (Spanish & Portuguese summaries)—*F. Auld*.

2585. Fabre, Nicole. [The emergence of archaic images in directed-reverie therapy of an adult.] (*French Etudes Psychotherapiques*, 1975(Mar), No 19, 3-15.—Uses material from 6 sessions of the therapy of a 30-yr-old man to demonstrate the following archaic themes: anality, darkness, enclosed place, and important tactile and kinesthetic sensations. It is proposed that the directed-reverie technique can be the occasion for a fusion of patient and therapist, as they participate together in the reverie. The directed reverie provides a language suited for translating experiences that the patient had during the preverbal period of his development; these inexpressible experiences are conveyed to the present by the images that appear in the reverie. (Spanish & Portuguese summaries)—*F. Auld*.

2586. Fox, Henry M. A discussion of the paper by Joseph D. Lichtenberg and Ping-Nie Pao on "Delusion, fantasy and desire." *International Journal of Psychoanalysis*, 1974, Vol 55(2), 283-285.—Examines Lichtenberg and Pao's (see PA, Vol 55: Issue 2) paper in terms of early and contemporary ego psychology.—*L. Lauro*.

2587. Friedman, Maurice. (San Diego State U) **Healing through meeting: A dialogical approach to psychotherapy. I.** *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 255-267.—Discusses the psychotherapeutic concept of healing through meeting, including meetings between therapists and clients, meetings among clients, and involvement in the community. It is suggested that the client demands to be dealt with in his or her own uniqueness, and to do so the therapist must engage and risk himself as a person. This raises the issue of the extent of the therapist's responsibility. Not only are the specific skills of the healer crucial, but also what takes place between therapist and client. The healing relationship is seen as involving dialogue, mutuality, trust, and partnership. This process is not restricted to psychotherapy; it can be important in surgery as well. (33 ref)—*J. Adams-Webber*.

2588. Gosciewski, F. William. (Edinboro State Coll) **Photo counseling. Personnel & Guidance Journal**, 1975(Apr), Vol 53(8), 600-604.—Clients are asked to bring a random selection of snapshots of themselves and others to counseling sessions. These are used to assist in developing or assessing rapport, diagnosis, and therapeutic gains.—*G. S. Speer*.

2589. Guntrip, Harry. **My experience of analysis with Fairbairn and Winnicott: How complete a result does psycho-analytic therapy achieve?** *International Review of Psycho-Analysis*, 1975, Vol 2(2), 145-156.—Considers psychoanalytic therapy as an understanding, personal relationship rather than a purely theoretical one. The therapeutic styles of W. R. Fairbairn and D. W. Winnicott are compared, with Fairbairn considered more orthodox and Winnicott more revolutionary. The author's psychoanalyses with each of these therapists failed to resolve his traumatic amnesia, though each therapist prepared for its resolution as a postanalytic development. Finding a good parent-relationship, or in

its absence, a good object-relationship with an analyst, is seen as a basis of psychic health.—*R. Tomasko*.

2590. Hannigan, Kathleen M. **Post-treatment integration of psychotherapeutic influence.** *Smith College Studies in Social Work*, 1975(Jun), Vol 45(3), 253-271.—Stresses the need for further research if clinicians are to know the quality and extent of their psychotherapeutic influence on former patients. Differences in the management of the termination process may have an important effect on this influence. A review of the literature indicates various theories and viewpoints regarding termination, which has been seen as a resolution of transference, as a mourning process, and as a period when internalization of newly acquired skills begins. Any useful this of post-treatment integration must enlist the participation of former patients.—*M. W. Linn*.

2591. Hare-Mustin, Rachel T. (U Delaware) **Ethical considerations in the use of sexual contact in psychotherapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 308-310.—Discusses the use of genital intercourse as a psychotherapeutic technique in the wake of changing sexual mores and recently developed treatments for sexual dysfunction. The use of sexual contact is considered with respect to the ethical standards of psychologists, especially those principles related to competency, community expectations, and the client relationship. It is concluded that genital contacts between therapist and patient are ethically unacceptable.—*C. McCreary*.

2592. Hargraves, David T. (Brigham Young U) **Client-rated effectiveness of the initial interview as a function of counselor style, client sex, dominance, and problem category.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 566.

2593. Hausner, M. & Doležal, V. (Krajský ústav národního zdraví, SKNV, Sadská, Czechoslovakia) **[Model of causal confrontation in integrative psychotherapy.]** (*Czech Československá Psychiatrie*, 1974(Oct), Vol 70(5), 299-305.—Formulates the theory of the "causal confrontation model" which, though based on 20 yrs of experience with psycholytic and psychedelic psychotherapy, is suitable for any form of integrative psychotherapy, regardless of whether psychomimetics are used or not. Psychotherapy is viewed as latent social learning in model confrontation (re-exposition) of the patient with his pathogenic past, present, and future. The confrontation model enlarges Alexander's corrective experience by Wolpe's competitive inhibition of anxiety. It integrates 5 target regions: neurophysiologic, intrapsychic, interpersonal, psychosomatic, and system of values (self-estimation). A graphic scheme of the model, applied to psychogenic disorders and depicting the combined approach of somato-, psycho-, and sociotherapy, is presented. (Russian & English summaries)—*V. Fischmann*.

2594. Henderson, James. (U Toronto, Canada) **Community transference: Toward a psychiatry-of-the-community.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 14-20.—Reviews the concept of community transference and discusses its relation to the use of illusory phenomena in alleviating the discomfort of maintaining object-relatedness, and to

nonpathological paranoia as a universal phenomenon of human groups. The importance of community transference in contemporary psychiatry is discussed, and its challenge is described to the community psychiatrist who aspires to some clearer definition of his professional role. Mention is made of the community psychiatry program of the Lakeshore Psychiatric Hospital as a possible prototype. (31 ref)—*Journal summary.*

2595. Holland, Norman N. (State U New York, Ctr for the Psychological Study of the Arts, Buffalo) **An identity for the rat man.** *International Review of Psycho-Analysis*, 1975, Vol 2(2), 157-169.—Discusses Freud's "rat man"—Paul Lorenz—in terms of the patient's ego identity or character. Lorenz is given an identity theme, describing his need to control benevolent goings out and catastrophic comings in, which establishes his essential continuity as a person. The mind is considered as an aesthetic object, open to an analysis of themes and patterns through the assumption of organic unity. (17 ref)—*R. Tomasko.*

2596. Janatka, J. (Psychiatrické oddělení UVN, Prague, Czechoslovakia) **[The role of empathy in the psychotherapeutic process.]** (Czech) *Československá Psychiatrie*, 1974 (Oct), Vol 70(5), 306-311.—Discusses the etymology and definitions of empathy; methods and techniques used to measure it; theories and empirical findings concerning its role in psychotherapy; and reasons for the divergence in conceptual approaches and experimental results. Recent English and American literature is quoted. (Russian & English summaries)—*V. Fischmann.*

2597. Kassirnov, Howard & DiGiuseppe, Raymond. (Hofstra U) **Rational role reversal.** *Rational Living*, 1975 (Spr), Vol 10(1), 44-45.—Discusses research which shows that rational emotive therapy (RET) therapists benefit from teaching and argues that this research provides the foundation for the suggestion that therapist and patient reverse roles. The patient practices playing the therapist and deals with the therapist's "emotional problem" using RET techniques, thus producing added benefit for the patient and the patients assimilation of RET. *G. J. Frankel.*

2598. Kelman, Harold. (Postgraduate Ctr for Mental Health, New York, NY) **Altered states of consciousness in therapy.** *Journal of the American Academy of Psychoanalysis*, 1975 (Apr), Vol 3(2), 187-204.—Stresses that altered states of consciousness occur in psychoanalysis. The therapist may be unaware, partially aware, or fully aware of them; they are integral to the therapeutic process and essential to effective therapy. Their occurrence and frequency can be facilitated, depending on the theory, technique, therapeutic relationship, and person of the therapist. Examples from therapy and surgical practice are given. (26 ref)—*R. Tomasko.*

2599. Kent, David & Carter, Cathy. **The origin and development of psychodrama and its relationship to radical theatre.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 71-82.—Reviews the influence of J. L. Moreno on contemporary theater. Topics discussed include the theater of spontaneity, Moreno's philosophy, cultural influences, the development of group psychotherapy and sociometry, and techniques of psychodrama. Elements common to both psychodrama and radical

theater are discussed: the collective creation of dramas, audience participation, spontaneous self-disclosure of the actors, concern with removal of creativity blocks, and facilitation of individual and cultural change. A theater designed to help women explore and express their potentials and oppressions is described. *R. Tomasko.*

2600. Kernberg, Otto F. **Further contributions to the treatment of narcissistic personalities.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 215-240.—Examines diagnostic and psychoanalytic treatment of narcissistic personalities, focusing on contrasts with H. Kohut's (1971) approach. Kohut views the grandiose self as fixation of an archaic primitive self. The present author views the grandiose self as a pathological structure and presents clinical material in support. The relationship between normal and pathological narcissism and implications for analytic technique and the management of transference, countertransference, and resistance are reviewed. The importance of treatment of narcissistic personalities is emphasized. (20 ref)—*L. Lauro.*

2601. Klein, H. S. **Transference and defence in manic states.** *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 261-268.—Presents a case history to illustrate the nature and treatment of mania. Treatment was conducted in 3 phases. In Phase 1, the patient treated the analyst not as object but as container for the patient's unwanted characteristics. During Phase 2, the patient recognized the analyst as real object and became threatened by separations, defending against the threat by denial. In Phase 3, the patient felt he had a "good container." Manic defenses are viewed, in agreement with M. Klein (1935), as an attack on external objects to prevent the destruction of self by them. Mania derives from failure in the containing processes in the mother-infant relationship.—*L. Lauro.*

2602. Knaus, William. **Cognitive-behavioral strategies for the therapeutic armamentarium.** *Rational Living*, 1975 (Spr), Vol 10(1), 41-43.—Discusses 2 methods of therapeutic intervention: systematic rational desensitization (a combination of rational therapy and Wolpe's strategy) and rational emotive problem simulation. Both techniques attempt first to identify irrational cognitions and then to dispute them. Rational emotive problem simulation includes simulating the stressful situation.

2603. König, K. **[Factors having an influence on conflict oriented motivation for psychotherapy in a clinical setting.]** (Germ) *Psychotherapie Medizinische Psychologie*, 1975 (Jul), Vol 25(4), 103-108.—Discusses the motivation of neurotic patients to begin, continue, and terminate treatment in a psychotherapy clinic. Factors inherent to the clinical setting which have an influence on patient motivation are examined. These factors can be divided into 2 groups: (a) those stemming from the patient's living together and (b) those introduced into the setting by the clinical staff, modifying patient motivation directly and indirectly.—*S. D. Babcock.*

2604. Lester, Eva P. (McGill U, Montreal, Canada) **Language behaviour and child psychotherapy.** *Canadian Psychiatric Association Journal*, 1975 (Apr), Vol 20(3), 175-181.—Questions the distinction conventionally made between play therapy and verbal psychotherapy. It

is argued that psychotherapy should be conceptualized as including not only a basic corrective experience but also a specific, interpretive response by the therapist; therefore, psychotherapy is necessarily bound to linguistic growth. It is doubtful that an interaction lacking verbal communication can be called psychotherapy. For the preschoolers, the therapist's verbalizations involve the naming of affect, wish, or fantasy. With the school-age child, the therapist uses interpretations to help the child master shapeless thoughts, vague emotions, fragmented memories, and fluid experiences. With older children, the therapist can use role playing or the playback of tape recorded sessions to make their relationship less focused on power relationships and, therefore, more conducive to verbal interchange. (19 ref) (French summary)—*F. Auld.*

2605. **Lichtenberg, Joseph D. & Pao, Ping-Nie.** *Delusion, fantasy and desire.* *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 273-281.—Attempts to conceptualize the relationship between a conscious desire expressed by a patient during a therapy session, a remembered latency period fantasy, and a delusion experienced during a psychotic period. Based on clinical material, a reappraisal is presented of the function, structure, and genesis of delusion, fantasy, and desire as metapsychological entities. It is suggested that a delusion forms during childhood to give representation to significant traumata affecting the separation-individuation tasks. Fantasizing is the testing ground wherein modes of satisfaction are tried out for their personal appeal; desire is the testing ground wherein concrete reality satisfactions are tried out for their attainability. Without fantasy, mental functioning would be mechanical; without desire, full awareness of self would not develop. (21 ref)—*Journal summary.*

2606. **McConville, Brian J.** (Queen's U, Kingston, Canada) *The future of child psychiatry: Mandate for change.* *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 209-214.—Argues that the future of child psychiatry is uncertain, since its present body of knowledge and its identity are unclear. It is maintained that the so-called radical child psychiatrist, who calls himself liberal, flexible, and open, is not as radical as the psychiatrist who returned to structure, careful clinical activity, and humility. (34 ref) (French summary)

2607. **Meltzer, Donald.** (Tavistock Clinic & Inst of Psychoanalysis, London, England) *Adhesive identification.* *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 289-310.—Discusses Freud's neglect of children's idea about spaces inside the self and inside objects, and M. Klein's concept of projective identification, a process of narcissistic identification in which part of the self is split off and projected into an object. "Adhesive identification" was formulated from a synthesis of observations of 3 types of patients: (a) very young infants who appeared "disorganized"; (b) certain adults whose dreams indicated disintegration processes and who felt that they were not held together by a good skin; and (c) autistic children, whose behavior was eventually seen as inability to conceptualize space relations (and therefore time relations), they could not distinguish between "inside" and "outside", their experience was 2-dimensional. It is felt that all 3 groups of patients exhibit "adhesive

identification," which is closely connected with mimicry, shallowness, and externalization of values. It is different from projective identification, and both types are forms of narcissistic identification.—*I. Davis.*

2608. **Moreno, Jonathan.** (Moreno Inst, Beacon, NY) *Psychodrama and the future of the social sciences.* *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 59-70.—Discusses psychodrama within the framework of contemporary events in the social sciences. A theoretical justification is presented for the claim that psychodramatic practice bridges the opposition between humanistic and behavioristic strategies in social science. Psychodrama is understood as a phenomenological psychology, and a phenomenological explanation of sociometry is presented. Areas in which the psychodramatic method is borrowed by behavioral scientists as well as by humanistically oriented researchers are surveyed. (19 ref)—*R. Tomasko.*

2609. **Oman, John B.** *A theology for psychodrama: In memory of Jacob L. Moreno, M.D., founder of Group Psychotherapy and Psychodrama.* *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 48-54.—Discusses a theater of reconciliation in which the director's basic theological views are inseparably bound up with the way the psychodrama is structured. Life's turmoil and confusion occurs when multiple emotions develop without any hierarchy of values. When emotions are organized around a purpose large enough to order the emotions, a healthful integration of being develops. Psychodrama is intended to promote this emotional reordering and is related to a theological doctrine of reconciliation. Sin is considered the alienation resulting from not being in touch with ourselves and our feelings.—*R. Tomasko.*

2610. **Ornstein, Paul H.** (Cincinnati General Hosp, OH) *A discussion of the paper by Otto F. Kernberg on "Further contributions to the treatment of narcissistic personalities."* *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 241-247.—Examines fundamental differences between H. Kohut (1971) and O. F. Kernberg's (see PA, Vol 55:Issue 2) approaches to understanding and treatment of narcissistic personality disturbances, emphasizing the transference neurosis in each approach.—*L. Lauro.*

2611. **Paris, J.** (Jewish General Hosp, Montreal, Canada) *Diagnosis before treatment.* *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 305-307.—Argues that the essence of a medical approach in psychiatry is the application of a structured diagnostic assessment. Treatment without diagnosis is a form of quackery. Psychiatric treatment, like any form of medical treatment, must be tailored to fit the individual patient. (French summary)—*Journal summary.*

2612. **Pohl, Jan.** (Deutschen Akademie für Psychoanalyse, Münchener Lehr- und Forschungsinstitut, W Germany) [*"Death instinct" as a defense formation, illustrated with a case study of a psychosomatic patient with symptoms of perversion, addiction and suicidal behavior.*] (Germ) *Dynamische Psychiatrie*, 1975, Vol 8(3), 159-170. Presents a case study of a psychosomatic patient with sex problems, drug addiction, and suicidal tendencies to demonstrate that repetition compulsion is not a manifestation of an innate death instinct, but a

perverted primary aggression which became destructive. The problem of the psychoanalyst who believes in an innate death instinct is discussed. If the analyst identifies with the aggressor in the patient's super-ego due to own fears of life, he makes an alliance with the patient's resistance. Belief in a death instinct is a manifestation of the analyst's lack of identity which is connected with a nihilistic attitude towards psychotherapy. Its manifestation, however, understood as a regressive defense against the fear of abandonment, is susceptible for analysis when in the process of the treatment destructive behavior is transformed into constructive aggression.—H. Bruml.

2613. Priggie, Nan K. **Helper characteristics and rated interview behavior.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 572.

2614. Richardson, Elizabeth A. (U Missouri, Kansas City) **The effects of videotape recording as an extension of group therapy with children who have learning disabilities.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1086.

2615. Robertiello, Richard C. **Addendum to object relations technique.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 306-307.—Discusses a technique involving touching, based upon object relations theory, for schizoid patients who have problems with intimacy stemming from their relationships with their mothers during the 1st year of life. Ways in which certain sexual connotations of this method may present difficulties are described, and suggestions for avoiding this problem are offered.—C. McCreary.

2616. Roncoli, Marianne. (New York U, Div of Nursing) **Bantering: A therapeutic strategy with obsessional patients.** *Perspectives in Psychiatric Care*, 1974(Oct-Dec), Vol 12(4), 171-175.—Presents the thesis that the therapist, like Cervantes, can be a psychological humorist, assisting the obsessional patient to gain insight through the use of bantering. M. Cervantes is described as the forerunner of the psychological humorist, especially in *Don Quixote*. It is suggested that bantering is meant to be a caricature of the patient's behavior, a humorous exaggeration where the therapist appears both a benevolent and ridiculing authority. Bantering in therapy implies that the therapist is making an attempt to mobilize constructively his own feelings of exasperation and the patient's anger. When employing humor, the therapist takes the risk of appearing imperfect, fallible, and human. But he also gives the patient the license to behave imperfectly, fallibly, and humanly. (21 ref)—M. L. Hogan.

2617. Sacks, James M. **The letter.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 184-190.—Describes a technique that involves the patient's "writing" a letter aloud. The patient speaks directly to an absent person in a manner combining the psychodramatic dialogue and the soliloquy. The director's verbal passivity and alternative physical positions are noted. The theoretical usefulness of this technique is attributed to the patient's temporary insulation from either positive or negative reactions from the letter's recipient, which enables the patient to risk expression of more spontaneous impulse laden material. This technique is contrasted to ordinary dialogue where

a great proportion of the material expressed is spoken for immediate effect.—R. Tomasko.

2618. Safer, Jeanne. (Postgraduate Ctr for Mental Health, New York, NY) **Effects of sex of patient and therapist on length of therapy.** *International Mental Health Research Newsletter*, 1975(Sum), Vol 17(2), 12-13.—Studied effects of sex of patients and therapists on duration of psychotherapy as a continuation of a study which had indicated that female/female dyads worked together longest. 200 case records from the files of the Postgraduate Center for Mental Health were divided into 8 groups of 25, each group representing 1 of 4 possible male/female, patient/therapist combinations in which patients were seen either once or twice weekly. Mainland's short form chi-square tested differences in number of treatment sessions. Findings show that (a) in opposite-sex combinations, male therapists kept females longer than female therapists kept males; and (b) while same-sex combinations showed no durational differences for therapy once weekly, in twice-weekly sessions male therapists worked longer with male patients than females with females. It is suggested that a male consciousness-raising backlash to the women's liberation movement may account for the change from the previous findings.—C. A. Heikkinen.

2619. Schwarz, Berthold E. **Telepathic humoresque.** *Psychoanalytic Review*, 1974-1975(Win), Vol 61(4), 591-606.—Contends that humor is intimately related to the subconscious and hence to the paranormal. Used tactfully and sparingly, it can be helpful in psychotherapy. 3 categories of what appear to be instances of telepathy and the paranormal allied to humor are presented: humorous situations from early parent-child relationships, physician-patient psychotherapeutic relationships, and strictly personal anecdotes. Numerous incidents in each category are presented and discussed briefly. (26 ref)—G. S. Speer.

2620. Shainberg, David. (Postgraduate Ctr for Mental Health, New York, NY) **Consciousness and psychoanalysis.** *Journal of the American Academy of Psychoanalysis*, 1975(Apr), Vol 3(2), 131-149.—Considers the objective of psychoanalysis to be helping the patient be more open to the unknown in the universe. Therapeutic attention should be directed at understanding the structures of the traditional diagnostic categories and how they emerge. Patients often feel they are victims of reality rather than participating agents in bringing about this victimization. They guide their lives with memories and order them around time. The problem of determining what is objective and subjective is considered. The patient is prepared to be open to the unknown through the exercise of forming and seeing the objectified. (16 ref)—R. Tomasko.

2621. Silverman, Lloyd H. (New York U) **Some psychoanalytic considerations of non-psychoanalytic therapies: On the possibility of integration treatment approaches and related issues.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 298-305.—Presents a theoretical discussion of differences between psychoanalytic and nonanalytic therapies, focusing on the attitude of the therapist towards patients' misperceptions of the treatment situation. In the psychoanalytic approach, the therapist analyzes mispercep-

tions and points out their relevance to the patients' current psychic life while nonanalytic approaches do not recognize the unconscious significance of such distortions and often ascribe them to a simple, conscious misunderstanding. Methods of integrating the 2 approaches are suggested, and clinical material is presented to illustrate the use of these approaches.—C. McCreary.

2622. Smith, Joan M. **The movie as medium for the message: or movies, dreams, and schizophrenic thinking.** *Perspectives in Psychiatric Care*, 1974(Oct-Dec), Vol 12(4), 157-164.—Suggests that a movie may have different implications for schizophrenic and normal persons. By identifying with film characters, the schizophrenic may find release for emotions that he has hitherto been unaware of. The movie's power to uncover unconscious associations suggests the potential therapeutic value of using movie fragments reported by schizophrenic patients in the same way that their reports of dreams are used. A case history demonstrates the technique. The rationale for this method is that dreams, movies, and schizophrenic thought have characteristics and functions in common. The following theory based on clinical data is proposed: the schizophrenic patient, with an abnormally impoverished fantasy life of his own, finds relief and comfort from watching movies because they satisfy his fantasy sense of reality by making fantasy seem real.—M. L. Hogan.

2623. Tauber, Edward S. (William Alanson White Inst, New York, NY) **Notes on dream interpretation.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 282-288.—Emphasizes that dream interpretation, despite its lack of scientific methodology, its high subjectivity, and its uncertainty of meaning, can be useful. It has acquired a high standing in psychoanalysis because when used effectively it can tap the mind and heart of man, open important vistas, and provide the therapeutic process with novelty. Selecting a small segment of a dream for interpretation leads to serious difficulties. Other aspects of interpretation considered are disguises, the initial dream, decoding systems, the role of technical "rules" in analysis, and color in dreams.—M. J. Stanford.

2624. Tosi, Donald J. & Moleski, Richard L. (Ohio State U) **Public forum: Rational-emotive crisis-intervention therapy.** *Rational Living*, 1975(Spring), Vol 10(1), 32-37.—Presents a conceptual framework for crisis-intervention, describing a model of the self in-crisis, irrational ideas contributing to the experience of crisis, and clinical excerpts utilizing the therapeutic mode suggested.

2625. Walker, Carolyn B. **Psychodrama: An experiential study of its effectiveness within the homosexual society.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 83-97.—Discusses the use of psychodrama to deal with inter- and intrapersonal issues within the homosexual culture. Psychodrama permits the homosexual to be his private, real self and to face roles and situations to which a successful adjustment has not been made. Problems of role conflict and the use of role reversal are described. Both stable and transitory relationships are considered, and a glossary of homosexual terms is provided.—R. Tomasko.

2626. Ward, Donald E. (Purdue U) **An experimental investigation of the effects of three empirically-derived**

counselor verbal response styles on client verbal behavior and on client perceptions of the interview. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2316.

2627. Wasserman, Norma M. & Klein, Tobl. (Jewish General Hosp, Montreal, Canada) **Psycho-opera: A new concept combining opera and psychodrama.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 204-211.—Describes how psycho-opera emerged, its theoretical rationale, and its value as a form of therapy. It stresses singing rather than speech as a form of communication, and uses humor to encourage having a good time in a group. The psychomusical drama centers around 4 themes: group participation, a social theme which crystallizes as the opera, an emphasis on individuality, and the idea of spontaneous leadership arising from the group. Topics discussed include structural processes, training of the director, the role of the opera leader, and the role of the assistants. A typical psycho-opera session is described.—R. Tomasko.

2628. Wilmot, Terry M. (U Illinois, Urbana-Champaign) **The effects of sensitizing clients in therapy to the analysis of facial expressions.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 574.

Group & Family Therapy

2629. Buiski, Peter. (John Jay Coll of Criminal Justice, City U New York) **Some contributions of ethology to group therapy: Dominance and hierarchies.** *International Journal of Group Psychotherapy*, 1975(Apr), Vol 25(2), 227-235.—Explores the extent to which the dynamics of the social grouping of animals in nature can serve as a model for the understanding of process in psychotherapy groups. Group dynamics necessary for the survival and perpetuation of animal groups serve the function of resistance in therapy groups. Clinical examples of the displacement of lower ranking by higher ranking members and the modification of hierarchical arrangements by alliances between members are given. Implications for the practice of cotherapy are noted.—R. Tomasko.

2630. Chassin, Laurie; Perelman, Michael & Weinberger, Gerald. (Teachers Coll, Columbia U) **Reducing parental resistance to examining family relationships: The therapeutic use of a child management task.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 387-390.—Presents a case study demonstrating the strategic use of a child-focused contingency management program that is designed to (a) illuminate the family's maintenance of the child's disturbed behavior and (b) encourage the parents to work on the factors in the marital relationship which were preventing them from being effective parents. The child was a 7-yr-old female having problems involving school underachievement, unassertiveness, temper tantrums, and disobedience.—C. McCreary.

2631. Comstock, Betsy S. & Jones, Mary A. (Baylor Coll of Medicine, Houston, TX) **Group therapy as a treatment technique for severely disturbed patients.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 677-679. Describes how an outpatient psychiatric department of a general hospital uses an economical 4

day/wk group program for severely disturbed patients who need intensive therapy but not hospitalization. The main treatment modality is group therapy, and patients also have access to occupational therapy, vocational rehabilitation counseling, and community activities. Follow-up of 48 patients showed that 82% felt they had improved.

2632. Crabtree, Loren H. & Horowitz, Harvey. (Inst of the Pennsylvania Hosp, Adolescent Treatment Ctr, Philadelphia) **Impromptu group: Beyond crisis intervention.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 356-359.—Discusses the therapeutic use of the spontaneously formed small group and its origins within the therapeutic community. The content and composition of these single session experiences are described, and 4 types of "impromptu groups" are discussed: the theme-oriented, the network-oriented, the individual-oriented, and the task-oriented. The development of the concept from its origins in crisis intervention and the therapeutic community are reviewed. It is concluded that the impromptu group concept is useful within a therapeutic community because it frees the larger community meetings from the tendency to be crisis-dominated and allows the withdrawn, psychotic, negativistic, and/or impulse-ridden patient a voluntary, time-limited small group experience which may ultimately lead to a more classical group therapy experience.—C. McCreary.

2633. Debow, S. L. (Mt Sinai Hosp, Toronto, Canada) **Identical twins concordant for anorexia nervosa: A preliminary case report.** *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 215-217.—Reports the treatment of identical twin girls, age 14, who were hospitalized because their weight loss exceeded 20% of expected body weight. While in the hospital, they ate the hospital food and gained weight rapidly. The twins had a close, symbiotic relationship. Family therapy revealed intense hostilities and conflicts.

2634. Dinkmeyer, Don. (Communication & Motivation Training Inst, Coral Spings, FL) **Adlerian group psychotherapy.** *International Journal of Group Psychotherapy*, 1975(Apr), Vol 25(2), 219-226.—Adlerian groups aim at increasing the client's self-esteem and developing his social interest by helping him discover his own life style and avoid the mistaken assumptions which cause feelings of inadequacy. Emphasis is placed on winning the patient's cooperation and helping him anticipate success. The group is used to explore the family atmosphere, the family constellation, and the subjective interpretation of the approach to life tasks. A mirror technique helps promote patient reorientation.—R. Tomasko.

2635. Durrett, Deborah D. & Kelly, Patricia A. (U Texas, Arlington) **Can you really talk with your child? A parental training program in communication skills toward the improvement of parent-child interaction.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 98-109.—Conducted an experimental research program in which 5 families completed the 6 2½-hr training sessions, and 5 families served as controls. The sessions used modeling, written manuals, videotape feedback of previous family interaction, focused videotape feedback of current parent-parent interactions, and behavior

rehearsals. Interviews and the Child-Parent Relationship Questionnaire were used to evaluate the program's effectiveness. Results indicate that the training group children demonstrated a greater increase in total talk time and number of responses during parent-child interaction, as well as a greater degree of attitude improvement toward the parent-child relationship. (48 ref)—R. Tomasko.

2636. Egan, Merritt H. (U Utah, Medical Coll) **Dynamisms in activity discussion group therapy (ADGT).** *International Journal of Group Psychotherapy*, 1975(Apr), Vol 25(2), 199-218.—Classifies and describes some of ADGT's therapeutic dynamisms which affect personality growth and behavior. 3 dynamisms are discussed: identification, reinforcement, and insight. Continuum charts are presented, illustrating therapeutic intervention in child-child conflict, morality, and responsibility. These approaches are considered to be the treatment of choice for much of the psychopathology of the latency period of development. The importance of breaking through the familiar ritual of routine therapy is stressed.—R. Tomasko.

2637. Eveson, Mark & Eveson, Susanna. **Role repertoire in marriage.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 119-122.—Examines the interactions of marriage partners in terms of their capacity to play mutually satisfying roles with each other. It is considered that rapid improvement in relationships results from the partners learning ways to expand and enhance their role repertoire.

2638. Flowers, John V.; Booraem, Curtis D. & Seacat, George F. (U California, Irvine) **The effect of positive and negative feedback on members' sensitivity to other members in group therapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 346-350.—Investigated whether the reception of negative feedback in group therapy increases a person's sensitivity to other group members. Ss were either clinical psychologists or social workers who participated in an experimental group involving personal, present tense, statements about problems where positive and negative statements were accompanied by tokens. Group members subjectively rated one another as to activity, mode, and rate of positive vs negative feedback. Objective measures were derived from number of tokens given and received and sensitivity was defined as the percentage of subjective evaluations that matched the objective ratings.—C. McCreary.

2639. Foulkes, Sigmund H. [Group-analytic approach and problems of large groups.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 423-445.—Presents an historical note concerning intrapsychic and community approaches and introduces the notion of large groups in experience and therapy. The structured elements of the therapeutic situation (intensity, duration, counter indications) are considered in the context of real life decisions and the role of minimal structure in large groups.—L. L'Abate.

2640. Gerstein, Alvin I. (Living Schwartz Inst for Children & Youth, Philadelphia, PA) **Variations in treatment technique in group activity therapy.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 343-345.—Describes Ginott's theories of group psy-

chotherapy with children and contrasts them with techniques utilized at a child guidance clinic. Groups were differentiated on the basis of "neurotic" and "ego-impaired" adjustment patterns; different goals were set for therapy for each group. Countertransference effects brought about by the different approaches are discussed.—C. McCreary.

2641. Greenfield, Rochelle C. (South Beach Psychiatric Ctr, Staten Island, NY) **Trial by fire: Rites of passage into psychotherapy groups.** *Perspectives in Psychiatric Care*, 1974(Oct-Dec), Vol 12(4), 152-156.—Draws parallels between patients in psychotherapy groups and the primitive initiation rites of isolation and silence reported by anthropologists and sociologists. It is stated that initiation is a process common to all human groups. 2 clinical examples illustrate how knowledge of primitive man's initiation rites guided a therapist's intervention when a new patient was added to a chronic schizophrenic therapy group. It is demonstrated that there is a definite parallel between rites of passage in primitive tribes and rites of passage in a modern group of schizophrenic patients.—M. L. Hogan.

2642. Grunebaum, Henry. (Harvard U, Medical School, Boston) **A soft-hearted review of hard-nosed research on groups.** *International Journal of Group Psychotherapy*, 1975(Apr), Vol 25(2), 185-197.—Reviews the research literature concerning the effectiveness of group psychotherapy and the characteristics of client and therapist which promote or hinder a successful outcome. Issues considered include therapy casualties, evaluation of outcome, similarity of cognitive style between patient and therapist, positive confrontation, pregroup preparation of patients, duration and frequency of treatment, group cohesiveness and composition, therapist's behavioral characteristics, and patient's sociological characteristics. A therapist's behavior is considered more important than his belief system. (2 p ref)—R. Tomasko.

2643. Hardcastle, Dexter R. (Brigham Young U) **The effects of a family counseling program on parent's family satisfaction, perceived integration, and congruence, and on specific behavior patterns in the family.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2766.

2644. Hart, Irvin H. (Camarillo State Hosp, CA) **Multi-disciplinary group therapy for revolving door patients.** *Small Group Behavior*, 1975(May), Vol 6(2), 204-209.—In an effort to solve the problem of repeated readmissions to a hospital's psychiatric ward, a multidisciplinary group of facilitators from nursing, social work, clinical psychology, and psychiatric residency programs met with 10 patients. Age and sex differences in patients had their equivalents in the facilitator group. Crisis-oriented problem solving techniques were used. A facilitator sat between every 2 patients so that some sub rosa individual contact was possible. After 6 mo of operation, a multidisciplinary strategy was instituted, concurrent with 3 small specialty sub-groups, one of which a patient participated in. The choices were Gestalt sociodrama and assertion training. The highest percentage of interest seemed to be in the multidisciplinary group. A more controlled evaluation procedure is planned for the future.—J. Rubin.

2645. Horowitz, Roslyn H. (U Miami) **The influence of various group counseling procedures on certain personality traits and weight control among obese women.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2299.

2646. Main, Thomas F. (Cassel Hosp, Richmond, England) [Some psychodynamic aspects of large groups.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 453-479.—Projection and projective identification as interpersonal concepts have value in understanding the behavior of unstructured large groups as well as the behavior of small groups, couples, and individuals.

2647. Monea, Helen P. (U California, School of Nursing, San Francisco) **A family in trouble: A case study of a family in conjoint family therapy.** *Perspectives in Psychiatric Care*, 1974(Oct-Dec), Vol 12(4), 165-170.—Proposes the use of action-oriented techniques during conjoint family therapy.—M. L. Hogan.

2648. Napolitani, Diego. [Maturational phases of the psychoanalytic group: Reciprocal phantomatic inductions between analyst and group.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 536-552.—Analytic group therapy progresses through 5 distinct phases: (a) clear distinction between group and leader, (b) expression of anger and strong feelings, (c) splintering of the group, (d) explicit delineation of id-ego-superego demands, and (e) integration of ego and ego-ideals.

2649. Napolitani, Fabrizio & Ancona, Leonardo. (U Cattolica del Sacro Cuore, Facoltà di Medicina e Chirurgia, Rome, Italy) [Internal processes of a psychoanalytically-led group in terms of Klein's identifications.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 553-576.—Attempts to integrate social psychological concepts taken from experimental small group research (cohesion, assumed similarity, and perceptual accuracy) with M. Klein's concepts of projective identification and externalization.

2650. Napolitani, Fabrizio. [The group as a therapeutic instrument.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 480-506.—Analytic methods of group psychotherapy are (a) rotating from one patient to another, (b) collective interpretations of group behavior, and (c) interpretations of relations among group members. Applications of these methods to families and couples with limiting conditions are considered in detail.

2651. Neto, Bernardo B. (Catholic U, Inst of Psychotherapeutic Methods & Techniques, Sao Paulo, Brazil) [Psychoanalytic therapy in a couples group.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 597-607.—Describes a group therapy situation in which the analyst's insensitivity to seating arrangements between spouses represented his refusal to deal with the idealized identity requested by the couples, thus depriving them of a necessary and decisive therapeutic experience.

2652. Palau, John; Leitner, Lewis; Drasgow, Fritz & Drasgow, James. (State U New York, Buffalo) **Further improvement following therapy.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 42-47.—Studied the effectiveness of empathy training and treatment groups.

13 follow-ups were done on 6 different treatment groups with 4 of the follow-ups extending over a 5-yr period. While it was found that the groups maintained their treatment termination levels of functioning, it was also found that 8-30% of the group members continued to improve after treatment. A positive correlation of 0.60 was found between the active-positiveness of the successful group therapists and their group's continued gainers' percents (CGP). Those who continued to improve seemed to do so by their own efforts and became their own active-positive therapists. The CGP is recommended as a new outcome criterion to assist in the comparison and evaluation of different studies. It is suggested that, in group treatment research, emphasis should be placed on what happens to the members after therapy termination. (19 ref)—*Journal summary*.

2653. Pontalti, Corrado. (U Cattolica del Sacro Cuore, Facoltà di Medicina e Chirurgia, Rome, Italy) [Metapsychological reflections on the first session of group analysis.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 577-588.—The immediate interpretation of castration anxiety activates a variety of transference reactions that characterize the 1st group-analytic session.

2654. Reiter, Gregg F. (Brigham Young U) The effects of a systematic counseling program for mothers on family congruence, integration, positive and negative verbal responses, and a problem child's behavior. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2793-2794.

2655. Toldson, Ivory L. & Pasteur, Alfred B. (Southern U) Developmental stages of Black self-discovery: Implications for using Black art forms in group interaction. *Journal of Negro Education*, 1975(Spring), Vol 44(2), 130-138.—Describes how group counselors or therapists using materials from art forms of Blacks could create appropriate, positive Black images at 6 hypothesized Black self-awareness stages perceived of as culminating in adequate self-concept of participant Blacks. Included in ego activities characteristic of the proposed psychophilosophical stages are examination of societal and personal decay, re-establishment of links with nature through oppressed peoples worldwide, recollection of Black-African and American experiences, analysis of the self in relationship to the hypothesized earlier stages, and comprehension of the reasons for one's ego-oppression and of the means for ego liberation. B. M. Anthony.

2656. Verhulst, Johan. (Catholic U, Leuven, Belgium) Marital change: An intensive, short-term approach. *International Mental Health Research Newsletter*, 1975(Sum), Vol 17(2), 7-10.—Describes a 3-wk marital therapy program integrated with theory and research. Treating unselected couples, the program is based on 4 principles: (a) seeing marriages as skill-based projects rather than as games of chance; (b) stressing relationships with partner equality over romantic happiness; (c) viewing marriage problems as interactions rather than as individual culpabilities; and (d) resolving problems through analysis and confrontation instead of defensive conformity to "external" rules. The therapeutic procedure is outlined. Problems being researched are described and an eclectic theoretical model is presented that emphasizes problem-solving with the help of active

enthusiastic, facilitative therapists. Of 120 couples treated, none has dropped out.—C. A. Heikkinen.

Encounter Group & Sensitivity & Human Relations Training

2657. Adesso, Vincent J. et al. (U Wisconsin, Milwaukee) Effects of a personal growth group on positive and negative self-references. *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 354-355.—Studied whether participation in a Gestalt-oriented personal growth group would increase positive and decrease negative self references. 18 college students received 5 2-hr sessions of personal growth training. An additional 18 controls in the same age range participated in a group discussion of current events. In each group, 2 observers counted the number of positive and negative self-references emitted by group participants. Results indicated that the number of positive self-references given by experimental Ss increased significantly as compared with controls. There was no significant difference between the groups in regard to negative self-references.—C. McCreary.

2658. Barrett-Lennard, G. T. (U Waterloo, Ontario, Canada) Outcomes of residential encounter group workshops: Descriptive analysis of follow-up structured questionnaire data. *Interpersonal Development*, 1974-1975, Vol 5(2), 86-93.—After a 6-mo follow-up interval, 90% (62 persons) of the members of 2 residential encounter group workshops completed a 2-step questionnaire evaluation. Results from the 2nd (more structured) step, using 8 multiple-choice items, are reported here. Significant gains in personal functioning and in confidence and effectiveness in interpersonal helping situations were indicated by 75% or more of the respondents. A similar proportion felt that this workshop-linked growth was continuing and reported important cognitive conceptual change. About half indicated substantial increases in sensitivity and openness with others. Attitude or behavior change perceived by significant others was noted by over half the sample. Most remaining respondents indicated mildly positive gain; 4 felt less confident as helpers, and other items drew a single rating of negative change. Results support and complement those derived from the low-structure first-step data reported by G. T. Barrett-Lennard et al. (see PA Vol 53:1236).—*Journal abstract*.

2659. Braaten, Lell J. (U Oslo, Norway) Developmental phases of encounter groups and related intensive groups. *Interpersonal Development*, 1974-1975, Vol 5(4), 112-129.—Reviews 14 current models of encounter group process and related group experiences, and presents composite and revised models. Theoretical considerations in model construction are noted, including the "phase" and "cycle of concern" conceptualizations. Common trends and unique aspects of the models are identified. (21 ref)—*Journal abstract*.

2660. Ficht, John C. (College of William & Mary) Social perceptions and verbal interactions in tape-directed and counselor directed encounter groups. *Dissertation Abstracts International*, 1974(Nov), Vol 34(A), 1611.

2661. Foulds, Melvin L. & Hannigan, Patricia S. (Bowling Green State U) **Effects of psychomotor group therapy on ratings of self and others.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 351-354.—Studied the effects of psychomotor group therapy on perception of self and others. Ss were 18 male and 18 female college students responding to an advertisement for personal growth-oriented, psychomotor group therapy. Attitudes toward self and others were assessed by a 29-item, semantic differential type scale. Ss were randomly assigned to treatment and control groups; the treatment group received 8 weekly sessions while the control group was told they could participate in a subsequent psychomotor group. Treatment consisted of a number of movement exercises followed by group discussion. Results show significant changes in a positive direction in attitudes of experimental Ss toward self and others and no change in controls. Follow-up testing of the treated group revealed continued positive change after 6 mos.—C. McCreary.
2662. Hale, Ann E. **Warm-up to a sociometric exploration.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 157-172.—Discusses the development of a sociometric consciousness by providing training in awareness of the underlying network of feelings between self and others. The use of the sociogram, a sociometric test, is described as especially helpful for groups concerned with personal growth, organizational development, human relations skill training, and psychodrama. An example of the warm-up phase of a training session is used to illustrate typical concerns expressed by groups in a sociometric exploration. Outlines of warm-up, action, and sharing phases of group development are given, together with 3 representative sociograms.—R. Tomasko.
2663. Hayes, James A. (State U New York, Albany) **An experimental study examining the self-concept and effectiveness of resident assistants in routine on-the-job training and in a special training program utilizing encounter tapes.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2298.
2664. Luther, Grace A. (U Illinois, Urbana-Champaign) **Levels of concreteness in encounter groups.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 568-569.
2665. Maxwell, Mary G. (U Texas, Austin) **The effects of focused videotape feedback in marathon therapy groups.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2307.
2666. Morehouse, Katherine J. (U California, Los Angeles) **The process of development of interracial encounter groups.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 570.
2667. Moreno, Zerka T. (Moreno Inst, Beacon, NY) **Psychodrama of young mothers.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 191-203.—Discusses uses of psychodramatic mother-role training. Problem anticipation and an exploration of the mother's self-image are considered.
2668. Purinton, Michael R. (Florida State U) **An investigation of the relationship between two methods of communication training and the personality and communication endices of nonprofessionals.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1627-1628.
2669. Ross, Laura H. & Allen, Robert M. (U Miami) **Two statistical approaches to two types of group confrontation.** *Small Group Behavior*, 1975(May), Vol 6(2), 220-228.—Measured personality changes resulting from 2 encounter groups. 1 group met for 12 sessions of 3 hrs each. The 2nd group met for 38 continuous hrs. The Psychological Screening Inventory (PSI) was administered before and after the groups met, and the data were analyzed according to the *t* test and by analysis of variance. Using the *t* test, the only significant difference for the weekly group was on the Defensiveness subscale. For the continuous group, the Social nonconformity subscale and the Defensiveness subscale showed pre-post measure differences. When data were analyzed according to analysis of variance, results similar to the *t* test were found. In addition, analysis of variance showed an interaction between time and treatment on the Social nonconformity subscale. It is suggested that defensiveness in members can be better overcome in a long continuous group than in a shorter, discontinuous group.—J. Rubin.
2670. Rowan, John. **Encounter group research: No joy?** *Journal of Humanistic Psychology*, 1975(Spr), Vol 15(2), 19-28.—Presents a critique of the study by M. Liberman et al (1973). Some of the shortcomings discussed include poor selection and assignment of Ss to treatment and control groups, different pretest instructions for experimental groups, excessive paperwork for Ss, the ignoring of the psychological environment, poor research design, and use of an inappropriate statistical model with incorrect conclusions drawn.—B. E. Allen.
2671. Sanford, Mary E. (U Utah) **T-group participant responses to selected trainer characteristics.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1711-1712.
2672. Schutz, Will. **Not encounter and certainly not facts.** *Journal of Humanistic Psychology*, 1975(Spr), Vol 15(2), 7-18. Presents a negative critique of a study by M. Lieberman et al (1973). The Lieberman study is described as having serious methodological weaknesses in research design and inappropriate statistical analysis. Also, many uncontrolled variables are reported (e.g., selection and assignment of Ss to treatment and control groups, different instructions given to experimental groups, pregroup differences between group leaders, group size and pattern of meetings, operation definitions inconsistent or vague, and pretests not given for determining emotional state of Ss. It is concluded that the Lieberman study is "an unfortunate event and the conclusions are without a shred of evidence."—B. E. Allen.
2673. Smith, Peter B. (U Sussex, England) **Are there adverse effects of sensitivity training?** *Journal of Humanistic Psychology*, 1975(Spr), Vol 15(2), 29-47.—Reviews the literature, including the study by M. Lieberman et al (1973), on adverse effects during and after Sensitivity Training. It is concluded that the criteria used have been diverse and of widely differing significance. It is urged that a more coherent definition and measurement of effects be formulated. (33 ref)—B. E. Allen.

Behavior Therapy & Behavior Modification

2674. DiGiuseppe, Raymond. (Hofstra U) The use of behavior modification to establish rational self-statements in children. *Rational Living*, 1975(Spr), Vol 10(1), 18-19.—Describes a procedure which uses the behavioral principles of modeling, fading, and reinforcement of antecedent conditions to modify the behavior of children with emotional disorders.
2675. Douglas, Virginia L. (McGill U, Montreal, Canada) Are drugs enough? To treat or to train the hyperactive child. *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 199-212.—Discusses the development of a viable training approach for hyperactive children. The approach originally developed by A. R. Luria (1961) and others, focuses on teaching the child more effective problem solving strategies and helping him achieve inhibitory control of his behavior through the use of self-verbalization and modeling techniques. Sufficient data are available to suggest the value of a positive reward especially the reward administered by the child himself; negative feedback has also been proved helpful. The adaptation of Luria's self-verbalization technique has appeared to be specifically useful for certain cases of hyperactivity. This approach involves choosing tasks which can be solved only by careful looking, listening, or moving and for which a strategy is required before action is taken. The task of testing the short- and long-term effectiveness of these techniques in a controlled study is being investigated to examine the combined effects of training and drug treatment. (50 ref)—A. H. Alawi.
2676. Gibb, J. Douglas; Stephan, Eric & Rohm, C. E. (Brigham Young U) Belief in biofeedback for the control of short-term stress. *Behavioral Engineering*, 1975(Spr), Vol 2(3), 80-83.—Explored the effect of biofeedback training and mental expectation or "belief" on the relief of short-term stress. 3 experiments using a total of 165 Ss demonstrated that similar low levels of tension could be achieved with physical training using biofeedback instruments or with "belief" training using a biofeedback machine for a demonstration only. 2 physiological indicants of short-term stress were the Ss' muscle tension and finger temperatures. Results seem to indicate the possibility of a method of instruction for educators and therapists that, when coupled with traditional biofeedback training, may produce superior results at a reduced monetary investment.—*Journal abstract*.
2677. Kirsch, Irving. (U Southern California) The politics of reinforcement. *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 311-316.—Theoretically explores some political and ethical issues involving the use of operant conditioning programs. Current programs are described, and the power relations that contribute to the shaping and maintenance of these programs are analyzed. Emphasis is placed on the extent to which such therapies aim at coercing the patient into emitting behavior that will benefit someone other than the patient himself. An approach to safeguarding the rights of institutionalized patients is suggested. C. McCreary.
2678. Klein, Helen A. (Wright State U) Behaviorally oriented treatment for juvenile offenders. *Corrective & Social Psychiatry & Journal of Behavior Technology* *Methods & Therapy*, 1975, Vol 21(2), 17-21. Examined programs using behavioral techniques with juvenile delinquents and evaluated their effectiveness. Such programs have used immediate reinforcement or punishment, intermittent reinforcers, mediated or secondary reinforcement (primarily tokens or points), and delayed reinforcement. The problem of achieving long-range and generalized behavioral change is critical. Stage systems appear to go beyond token and contract techniques and enable the juvenile offender to advance progressively. Each step (e.g., rookie, regular, veteran, alumni) was earned by acceptable behavior at the preceding step. Problems and limitations are traced back to the original rationale for behavioral techniques. Some psychosocial characteristics of juvenile delinquents are considered (e.g., manipulative tendency, active orientation, suspicion and hostility to adults, concrete thinking) that may allow for more productive application of the approach. The development of personal responsibility emerges as an important consequence of appropriate use of behavioral principles. Behavioral programs are successful to the extent that they can use the characteristics of delinquents within the technique's boundaries to develop this individual responsibility. (28 ref)—J. Sorokac.
2679. Linkenhoker, Dan D. (Indiana State U) Increasing the effectiveness of timeout from reinforcement. *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 326-328.—Discusses a procedure for increasing the therapeutic effectiveness of timeout from reinforcement (TO) with a juvenile delinquent population. Generally, an undesirable side effect of TO is that it removes the individual from his environment without providing an opportunity for practicing desirable alternative responses. Responsibility and decision making are, therefore, not reinforced. During the TO period, this procedure requires the individual to analyze and tape a description of the behavior responsible for his placement in TO and to offer 3 alternative solutions to that behavior. The tape is later played before a group of peers and staff who evaluate its quality and award tokens on the basis of an accurate description of the behavioral incident and the feasibility of the alternative solutions. This procedure suggests that TO can be designed to increase practical problem-solving skills and self-responsibility. A brief case study detailing the procedure is provided.—McCreary.
2680. McLaughlin, T. F. & Malaby, J. E. Modification of assignment completion with token reinforcement procedures. *Psychology*, 1975(May), Vol 12(2), 6-10.—Studied the effects of a token reinforcement program on the assignment completion of 4 poorly performing 6th graders, using their assignment completion in the presence of another teacher in a different subject matter area as a control technique. Over 450 individual assignments were examined. Results indicate that the use of back-up reinforcers were effective in improving assignment completion.—*Journal summary*.
2681. McWhirter, J. Jeffries & Hudak, John L. (Arizona State U) Parents' group on child management. *Devereux Forum*, 1975(Spr), Vol 10(1), 13-18. Briefly describes 7 meetings with parents for the purpose of presenting behavioral child management techniques.

2682. Palmer, Sushma; Thompson, Robert J. & Linscheid, Thomas R. (Georgetown U Hosp) **Applied behavior analysis in the treatment of childhood feeding problems.** *Developmental Medicine & Child Neurology*, 1975(Jun), Vol 17(3), 333-339.—Behavioral mismanagement has been seen as a major cause of feeding problems in children. The case of a 6-yr-old paraplegic boy who subsisted almost entirely on pureed food is discussed. Treatment by applied behavioral analysis resulted in his taking food normal for his age, sustained in a follow-up after 1 yr. (French, German, & Spanish summaries) (20 ref).—P. W. Pruyser.

2683. Powers, Pauline S. & Powers, Henry P. (U South Florida, Medical Coll) **Using a hospital for desensitization of an outpatient's illness related fears.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 675-677.—A 38-yr-old female outpatient with phobias related to enclosed places, hospitals, doctors, and cancer was treated by systematic desensitization using the facilities of a general hospital. Steps in treatment included securing a complete psychiatric and social history, teaching the patient relaxation therapy techniques, and establishing a hierarchy of anxiety provoking stimuli specifically related to the patient's fears.

2684. Wilson, Woodrow & Calhoun, James F. (State U New York, Stony Brook) **Behavior therapy and the minority client.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 317-325.—Discusses the issue of the White behavior therapist and the Black (or other minority) client, stressing problems of differing expectations and styles of communicating. It is pointed out that the therapist should be especially concerned with establishing a trusting relationship and that he learn about the culture and environment of the minority client. Particular problems of various methods (rational-emotive, aversive conditioning, desensitization, assertion training, and operant techniques) are discussed.—C. McCreary.

2685. Yager, Geoffrey G. (U North Dakota) **A new behavioral emphasis: Turning the inside out.** *Personnel & Guidance Journal*, 1975(Apr), Vol 53(8), 585-591. A survey of case study literature on self-management by covert conditioning suggests a number of ways in which this procedure can be used for self-change. 5 self-management techniques based on classical conditioning (relaxation, desensitization, thought stopping, covert sensitization, and assertive training) are described and compared with operant conditioning procedures. When using these methods, counselors cannot take credit for successful resolution of client problems, as the client becomes his own observer and evaluator. Counselors may, however, encourage clients to help themselves through the use of appropriate covert conditioning procedures. (25 ref)—G. S. Speer.

Drug Therapy

2686. Aguilar, Santiago J. (Central Georgia Regional Hosp, Milledgeville) **An open study of mesoridazine (Serentil) in chronic schizophrenics.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 484-489.—Evaluated the usefulness of mesoridazine besylate in the treatment of chronic schizophrenia in an 8-wk open-label trial with 12 male and 41 female chronic schizophrenics

who had ceased to progress beyond a certain level of functioning despite continued psychotropic medication (not including mesoridazine besylate). After a 10-day washout period, 56 received the drug in intramuscular doses of 25-150 mg daily on the 1st 10 study days, followed by daily tablet doses of 25-400 mg until the final day of the study. Ratings on the Nurses' Observation Scale for Inpatient Evaluation showed that Ss were significantly "less mentally ill" at the end of the washout period and underwent a statistically highly significant further improvement in the course of the mesoridazine besylate treatment. Only 2 Brief Psychiatric Rating Scale items improved significantly during the washout period. Treatment with the drug led to improvement in thinking disturbances and in psychomotor, paranoid, and depressive disturbances.—Journal summary.

2687. Amm, M. G. & Werry, J. S. (U Auckland, Medical School, New Zealand) **Methylphenidate in children: Effects upon cardiorespiratory function on exertion.** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 119-131.—10 hyperactive/aggressive males were given methylphenidate (0.3 mg/kg) and an inert placebo in a double-blind, crossover design. Heart rate, respiratory rate, and work done (i.e., the number of pedal rotations) were measured under standardized conditions of rest and under light, moderate, and heavy exercise, using a modified exercycle and postexertion rest. Compared with the placebo, methylphenidate produced increases in heart rate at rest that persisted during exercise but decreased somewhat at the highest exertion levels. Respiration rate was not significantly affected, though the mean rates on methylphenidate reversed to less than those on the placebo during exercise. These results, which replicate findings by others, suggest that (a) methylphenidate increases heart rate, but that this effect can be eliminated, at least in part, by exertion, and (b) it may cause a reduction in oxygen expenditure during exercise, possibly by vasoconstriction. (16 ref) *Journal summary*.

2688. Ban, T. A.; Lehmann, H. E.; Sterlin, C. & Climan, M. **Comprehensive clinical studies with thiothixene.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 473-477.—Conducted a 2-phase clinical study to (a) examine the range of therapeutic activities of thiothixene in 60 hospitalized psychiatric patients belonging to 4 different diagnostic groups and (b) determine the place of thiothixene among various antipsychotic drugs in 90 hospitalized schizophrenic patients. Results of Phase 1 show that 4-40 mg/day produced statistically significant improvement in the total scores, Depression factor scores and Anxious Tension, Depression cluster scores of the Brief Psychiatric Rating Scale (BPRS) in psychoneurotic Ss; and in the Depression factor scores and the Social Competence, Manifest Psychosis, and Retardation factor scores of the Nurses' Observation Scale for Inpatient Evaluation (NOSIE) in schizophrenic Ss. In Phase 2, it was found that thiothixene produced statistically significant changes in the factor scores Social Interest, Personal Neatness, and Retardation of the NOSIE; clopenthixol produced statistically significant improvement in the factor scores Social Competence, Social Interest, Irritability, Manifest Psychosis, and Retardation of the NOSIE and the total

scores of the BPRS; and chlorprothixene produced statistically significant improvement in the factor score Personal Neatness of the NOSIE.—*M. E. Pounsel.*

2689. **Campbell, Magda.** (New York U, Medical Ctr, Children's Psychopharmacology Unit) **Psychopharmacology in childhood psychosis.** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 238-254.—A review of the literature on psychopharmacology indicates that diphenhydramine is effective even in very disturbed schizophrenic children, particularly those with high IQ's. The psychomotor stimulants benzedrin and dextroamphetamine, even in very low doses, often worsen psychosis. Both chlorpromazine and thioridazine, though widely used, have negative effects on cognitive behavior and learning in general in childhood. Trifluoperidol has proved more effective than other drugs. Similarly, thioxanthene, molindone hydrochloride, hallucinogen's, and megavitamins are also used with different effects. More recently, the administration of lithium has resulted in decreasing such symptoms as hyperactivity, and aggressiveness. The therapeutic effects of levodopa in schizophrenic children have been investigated. However, the purpose of drug treatment is to make the child more amenable to other forms of therapy, and it is suggested that a particular drug therapy should be discontinued if it interferes in any way with maturation, development, and learning. (74 ref)—*A. H. Alawi.*

2690. **Conley, Daniel P.** (Arizona State U) **Effects of Ritalin on hyperkinetic children attending the Glendale elementary schools.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1072-1073.

2691. **Connors, C. Keith.** (U Pittsburgh, Medical School) **Controlled trial of methylphenidate in preschool children with minimal brain dysfunction.** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 61-74.—Conducted a study with 53 6-yr-olds with minimal brain dysfunction (MBD) to determine the safety and efficacy of the use of methylphenidate with younger children. Medical and perinatal histories were obtained for all Ss who were also administered a battery of psychological tests (e.g., the Draw-A-Man and Matching Familiar Figures tests). Visual and auditory cortical evoked responses were obtained before treatment and at the end of the study. Results show the following: (a) Clinical improvement of Ss on the drug was apparent with a relatively small average dose of the drug. (b) Objective measures of intelligence and visual-motor integration showed significant enhancement in Ss given the drug compared with those receiving a placebo. (c) Measures of vigilance, seat activity, and impulsivity did not show significant enhancement by the drug even though gains were always greater than in the placebo group. (d) Parents noted a significant degree of reduction in restless and disturbing behavior in their ratings of children receiving the drug rather than a placebo. (e) The drug enhanced the cortical evoked responses in the left parietal area. (f) Side effects of the drug were generally minimal, and there was no significant weight loss during the study. Findings suggest that the results are more variable and unpredictable than in similar treatment of older MBD children. —*M. E. Pounsel.*

2692. **Connors, C. Keith.** (U Pittsburgh, Medical School) **A placebo-crossover study of caffeine treatment**

of hyperkinetic children. *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 132-143.—8 hyperkinetic children who had been successfully treated on either dextroamphetamine or methylphenidate participated in a double-blind, crossover study of treatment with caffeine or a placebo in counterbalanced order. Parent, teacher, and clinical observations were employed at baseline and 3 wks after the 2 treatment regimes. Measures of attention, activity level, and language function were also obtained at these times. Only 1 case showed some possible clinical benefit from caffeine. 2 factors may account for the apparent failure of this stimulant. First, the dosage level was fixed, and the minimal side effects suggest the possibility that adequate dosage levels were not reached. Second, it is possible that only certain types of children are responsive to caffeine. On the basis of the findings the use of caffeine is not recommended for hyperkinesis until further research is undertaken.—*A. H. Alawi.*

2693. **Gittleman-Klein, Rachel & Klein, Donald F.** (Queens Coll, City U New York) **Are behavioral and psychometric changes related in methylphenidate-treated, hyperactive children?** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 182-198.—Studied 39 hyperactive 6-12 yr olds to examine the relative efficacy of a placebo, methylphenidate, thioridazine, and methylphenidate and thioridazine combined. A battery of behavioral and psychological measures was administered before and after treatment. Results indicate no relationship between psychometric and behavioral improvement after 4 wks and a weak relationship after 12 wks of treatment. Data fail to support the hypothesis that psychometric and behavioral changes occur together in hyperkinetic children treated with stimulants. The notion that a primary, unitary, CNS function is ameliorated by stimulants seems unlikely. Drug effects in this population appear more complex.—*A. H. Alawi.*

2694. **Gorbov, F. D. & Uskov, F. N.** (Scientific Research Inst of General & Pedagogical Psychology, Moscow, USSR) [The psychology of drug intervention.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 39-46.—Discusses the effect of extrapharmacological variables in cases of drug intervention: physician-patient interaction, the placebo effect, the patient's negativism, and the patient's conceptual model of anticipated drug effect. Patients who lack the latter do not respond to drugs as well as those who do, hence the importance of proper procedure in drug administration. (English summary) (54 ref)—*L. Zusne.*

2695. **Greenberg, Lawrence M.; Yellin, Abrahim M.; Spring, Carl & Meicall, Mary.** (U Minnesota, Div of Child & Adolescent Psychiatry) **Clinical effects of imipramine and methylphenidate in hyperactive children.** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 144-156.—37 hyperactive children between the ages of 6 and 13 who had responded well to methylphenidate were treated with imipramine, methylphenidate, or a placebo. The results of this double-blind, crossover study suggest that methylphenidate has a more rapid onset of action and produces fewer side effects than imipramine. Moreover, methylphenidate treatment was associated with improved social relatedness and coordination.

Imipramine appeared to exert a sedative effect.—*Journal summary.*

2696. Gutton, Ph.; Estrabaud, M. & Allain, J.-P. (U Paris VII, Lab of Pathological Psychology & Psychoanalysis, France) [Study of the alteration of psychic resistance of 53 adolescent hemopheliacs at the time of introduction of a major therapeutic technique.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(13-15), 717-740.—Conducted a study to examine the effects of the introduction of a major therapeutic technique into the medical routines of 53 adolescent hemopheliacs on the psychodynamics of the organic symptoms of these Ss. The therapeutic technique, designed to enable the Ss to handle their hemophelic episodes, required them to learn to self-administer antihemophelic concentrates. Analysis of the clinical data on individual Ss revealed that the learning of the technique was met with the same resistances as those encountered when beginning psychotherapy with these adolescents. Inversely, however, the technique appeared to constitute a psychotherapeutic act.—Z. M. Cantwell.

2697. Itil, T. M. et al. (New York Medical Coll, NY) **Clinical and CNS effects of oral and i.v. thyrotropin-releasing hormone in depressed patients.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 529-536.—In Study 1, a single-blind trial with saline control, 9 patients were treated parenterally with 500 and/or 1,000 µg thyrotropin-releasing hormone (TRH) concurrent with previous medication; in Study 2, a double-blind experiment, 4 patients were given 100 mg TRH orally for either 3 or 5 days during a 14-day study period. Both oral and iv TRH produced systematic alterations in brain function of depressive patients as determined by scalp-recorded computerized cerebral biopotentials (computer EEG). The computer EEG (CEEG) profiles of both formulations were not only very similar to each other, but also resembled the CEEG profiles of psychostimulant compounds. As in CEEG findings, TSH plasma levels also indicated that oral TRH was an active compound. Although some antidepressive effects were observed after both formulations, they were not present in every patient, and it was not always the case after repetitive TRH administration, nor were the effects on depressed mood too impressive. On the other hand, in almost all patients certain behavioral effects of TRH were seen which related to "life instincts" and "life performance." The increase of interest, desire, and drive for work, food, and sex was one of the most striking findings, particularly after iv TRH. This may be responsible for the antidepressive effects of TRH in patients in whom depression may be the result of an inhibition of instinctive functions. (20 ref)—*Journal summary.*

2698. Johnson, Walter C. **A neglected modality in psychiatric treatment: The monoamine oxidase inhibitors.** *Diseases of the Nervous System*, 1975(Sep), Vol 36(9), 521-525.—Attempts to show that MAO inhibitors are very useful when the proper indications for their employment are observed and are relatively safe provided that appropriate precautions such as the avoidance of cheese and other foods high in tyramine content are taken by the patients being treated with these compounds. The history, pharmacology, side effects, and

indications for their use are reviewed, and it is indicated that the MAO inhibitors are the therapeutic agents of choice in atypical depressions associated with anxiety, phobic and hysterical symptoms, and depressive illnesses (including endogenous depressions) which have failed to respond satisfactorily to tricyclic antidepressants. (20 ref)—*Journal summary.*

2699. Katz, Sidney; Saraf, Kishore; Gittleman-Klein, Rachel & Klein, Donald F. (Long Island Jewish-Hillside Medical Ctr, Glen Oaks, NY) **Clinical pharmacological management of hyperkinetic children.** *International Journal of Mental Health*, 1975(Spring/Summer), Vol 4(1-2), 157-181.—Observes that the syndrome of the hyperactive child is not a single entity, and the phenomenology and treatment of the syndrome are far from precise. The etiology is considered unclear, and the subsequent course is still imprecisely known. The physician who treats these children must realize that this is a time-consuming undertaking requiring close contact with parents and school, constant review of treatment strategies, and persistence in looking for answers. As a result, hyperkinetic children can best be managed in clinics that have staff available to render a variety of services. Guidelines for the effective management of hyperkinetic children are proposed.—*Journal summary.*

2700. Latimer, P. R. & Braden, D. H. (Queen's U, Kingston, Canada) **Roussy-Levy syndrome with psychosis.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 287-289.—Presents the case of a 39-yr-old woman who had suffered from neurological disorders since childhood, who now came into hospital with worsened neurologic symptoms and paranoid ideas. There was no evidence that the paranoid symptoms were physically caused. Treatment with thioridazine cleared up the psychosis. (French summary)

2701. López-Ibor Allno, J. J.; Ayuso Gutiérrez, J. L.; Montejo Iglesias, L. & Hernández Herreros, M. (Facultad de Medicina de Salamanca, Spain) [Thyrotropic hormone (TRH) therapy for primary depression.] (Span) *Actas Luso-Espanolas de Neurologia, Psiquiatria y Ciencias Afines*, 1974(Mar-Apr), Vol 2(2), 91-102.—Administered TRH alone (5 patients) and in association with tricyclic antidepressants (8 patients) to evaluate its effectiveness in treating chronic depression. No significant clinical improvement was noted under either condition. (English summary)—D. J. Clair.

2702. Moseley, John I. & Penry, J. Kiffin. (NIH, National Inst of Neurological Diseases & Stroke, Applied Neurologic Research Branch, Bethesda, MD) **Antiepileptic medication in chronic care facilities: Results of a review of the medical records of 773 patients in seven nursing homes, Montgomery County, Md.** *Public Health Reports*, 1975(Mar-Apr), Vol 90(2), 140-143.—Examined the frequency of and the indications for the use of antiepileptic medications in chronic care facilities. The charts of 773 patients in 7 nursing homes were reviewed, and 44 patients who were on various antiepileptic medications were studied. Results show that diagnosed epilepsy was documented in the medical records of 6 of the 44 Ss. 18 of these Ss had not been diagnosed as epileptic but had had 1 or more seizures that were observed by the nursing staff or documented in their charts. Among the 44 patients on

antiepileptic medications, no documented reason for the prescription of these drugs was available for 17. The implications of these findings are discussed.—*M. E. Pounsel.*

2703. Ostow, Mortimer. Treating depression with tranquilizers, with dissenting view of lithium carbonate therapy. *New York State Journal of Medicine*, 1975 (Apr), Vol 75(5), 693-696.—Reports that many patients who are depressed or subject to depression respond to small doses of thioxanthene or phenothiazine tranquilizer with an antidepressant effect. Above a low threshold, the effect gives way to an accentuation of depression. This antidepressant effect can be utilized for the treatment of depression in a large proportion of depressed patients. Manic depressives will be most responsive; and those depressives who exhibit an active life style during periods of remission will also respond well. The advantages of this treatment include prompt response (24-48 hrs) and relative freedom from side and toxic effects. Lithium's action in the treatment of mania is surpassed by moderate or high doses of tranquilizer; and for the deterrence of relapse during remission, low doses of tranquilizer are less toxic and more flexible than lithium, although no less potent.—*Journal abstract.*

2704. Rainaut, J. (Ctr Psychiatrique, Aix-en-Provence, France) [Statistical analysis of the comparative double-blind study of the activity of loxapine and thioridazine.] (Fren) *Encéphale*, 1975 (Feb), NS Vol 1(2), 147-160.—Reports a comparison of loxapine to thioridazine in the treatment of schizophrenia. With either drug, chronic schizophrenics showed significant and similar general improvement as early as the 2nd wk.

2705. Safer, Daniel J. & Allen, Richard P. (Johns Hopkins U, Medical School, Div of Child Psychiatry) Side effects from long-term use of stimulants in children. *International Journal of Mental Health*, 1975 (Spr-Sum), Vol 4(1-2), 105-118.—Recent research indicates that dextroamphetamine and methylphenidate can adversely affect the growth of hyperactive children and that methylphenidate can produce an elevation of resting pulse during the period of drug effect. Dextroamphetamine, when given for a period of 2 or more years, causes a significant suppression of gains in weight and in height. When stimulant medication is abruptly withdrawn, a significant growth rebound follows. The prolonged use of methylphenidate in hyperactive children causes a significant degree of growth suppression only if doses exceed 20 mg/day. While the use of dextroamphetamine in the treatment of hyperactivity in children causes no apparent change in the cardiovascular system, methylphenidate produces a significant elevation in resting pulse during the period of drug effect. Initially, methylphenidate results in an average heart-rate increase of 12 beats/min. During the 1st 4 mo of treatment, this averages 9 beats/min; subsequently, however, the increase is negligible. Older children have smaller pulse changes than younger ones. EEG studies reveal that rebound increases in Stage 4, and REM sleep occurs when the use of dextroamphetamine is abruptly discontinued. 2706. Satterfield, James H. & Cantwell, Dennis P. (Gateways Hosp, Los Angeles, CA) Psychopharmacology in the prevention of antisocial and delinquent

behavior. *International Journal of Mental Health*, 1975 (Spr-Sum), Vol 4(1-2), 227-237.—Several cross-sectional studies of adult sociopaths and hyperactive children have reported similar clinical, EEG, neurophysiological, behavioral, and psychological abnormalities in these 2 separately recognized psychiatric syndromes. Longitudinal studies of children who later became sociopathic suggest that they suffer from childhood problems in many ways similar to those of hyperactives. Follow-up studies in their early and mid-teens have reported serious delinquent behavior. Family studies also suggest that there may be a familial relationship between childhood hyperactivity and adult sociopathy. These studies lead to the question of whether the hyperactive child syndrome is a precursor of juvenile delinquency and whether early treatment of the hyperactive child can prevent an antisocial outcome. A specific treatment (medication with a stimulant) has been demonstrated to be effective. Whether this also prevents subsequent serious delinquent behavior is not yet known. However, since no other treatment has been demonstrated to be effective in reducing antisocial behavior, the use of stimulant medication in treating hyperactive children seems to be a promising area for research into the prevention of juvenile delinquent and adult criminal behavior. Further long-term, clinical, and family studies of hyperactives are necessary to determine both the nature of the relationship among childhood hyperkinesis, juvenile delinquency, and adult sociopathy and whether stimulant drug treatment of hyperkinetic children prevents such later-life syndromes. (45 ref)—*Journal summary.*

2707. Shapiro, William R. (Memorial Sloan-Kettering Cancer Ctr, Neuropsychiatric Service, New York, NY) Treatment of cataplexy with clomipramine. *Archives of Neurology*, 1975 (Oct), Vol 32(10), 653-656.—A new antidepressant drug, clomipramine hydrochloride, closely related to imipramine hydrochloride, was used to treat 1 female and 3 male 24-56 yr old patients suffering from cataplexy, sleep paralysis, and hypnagogic hallucinations. Attacks of cataplexy were associated with REM electroencephalographic patterns. Clomipramine, in doses of 25-75 mg/day, completely stopped all attacks of cataplexy, sleep paralysis, and hypnagogic hallucinations within 48 hrs of initial therapy. Ss were free of symptoms for periods of 10-21 mo. Side effects included impotence in the male Ss, but no hematologic, cardiovascular, hepatic, or renal toxic effects were observed. Available evidence suggests that such drugs inhibit those brain stem systems that control the toxic components of REM sleep.—*Journal abstract.*

2708. Smith, Ronald C. (U Southern California Medical School, Los Angeles) Amoxapine, imipramine and placebo in depressive illness. *Current Therapeutics Research*, 1975 (Aug), Vol 18(2), 346-353. Conducted a 6-wk double-blind study to compare amoxapine with imipramine and placebo in 90 19-59 yr old depressed outpatients. Hamilton Rating Scale for Depression findings showed amoxapine to be superior to placebo in alleviating sleep disturbances as well as anxiety and depression, after 1-2 wks; imipramine was more effective than placebo in reducing agitation. Zung Self-Rating Depression Scale results favored amoxapine over placebo.

bo in the reduction of general depression and agitation, and amoxapine over imipramine in improving appetite; imipramine produced a greater decrease in irritability and restlessness than placebo. It is concluded that amoxapine at a daily dosage of 600 mg is an effective agent for the treatment of depressive disorders in outpatients. Side effects appeared similar in type, incidence, and severity to those produced by imipramine.—*Journal abstract.*

2709. Sprague, Robert L. & Sleator, Esther K. (U Illinois, Children's Research Ctr) **What is the proper dose of stimulant drugs in children?** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 75-104.—Reviews the literature on the use of stimulant medication with children and argues the following points: (a) Dose-response relationships are important to the clinician as well as to the more theoretically oriented researcher. (b) Dose-response relationships differ for different target behaviors. (c) The titration method uses social behavior as the main criterion for determining dosages of stimulant medication. There is evidence that the doses considered optimal when this method is used, as recommended and accepted in pediatric psychopharmacology, are well above the optimal range for cognitive performance. Both the titration method of determining dosage and the empirical facts obtained with the titration method are challenged. (58 ref)—*Journal summary.*

2710. Thornton, William E. & Thornton, Bonnie J. (Illinois Drug Abuse Programs, Chicago) **Lithium intoxication: A report of two cases.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 281-282.—Reports 2 cases of toxic reaction to lithium carbonate. One patient had symptoms resembling organic brain syndrome, although he did not have high serum lithium. The other patient had CNS signs of acute intoxication.

2711. Weiss, Gabrielle. (McGill U, Montreal, Canada) **The natural history of hyperactivity in childhood and treatment with stimulant medication at different ages: A summary of research findings.** *International Journal of Mental Health*, 1975(Spr-Sum), Vol 4(1-2), 213-226.—Conducted an observation study with 28 hyperactive preschool children and 26 matched controls. Observations were made during free play and during half-hour periods of structured play. After 3 wks, half of the hyperactive children were given a 3-wk trial of methylphenidate, and the other half was given an identical-looking placebo in a crossover design. 3 wks later, Ss on the active drug were given the placebo and vice versa. Results show great variability in the hyperactive Ss. Methylphenidate was found to be superior to the placebo in reducing hyperactivity. However, the drug proved no more useful for the "true" hyperactives than for the "situational" ones. Furthermore, the homes were more pathological for the true than for the situational hyperactives. It is concluded that there is considerable heterogeneity in the phenomenology of preschool hyperactives. (21 ref)—*A. H. Alawi.*

2712. Zura, Martha M. (Northern Illinois U) **Effects of medication on learning in hyperactive four-year-old children.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2407.

Hypnotherapy

2713. Barone, David F.; Blum, Gerald S. & Porter, Marcia L. (U Wisconsin, Div of Science, Parkside) **Experimental analysis of techniques for eliminating obsessions.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Oct), Vol 23(4), 236-248.—Conducted a study with 2 female undergraduates, highly susceptible to hypnosis (indicated by scores on the Stanford Hypnotic Susceptibility Scale, Form A) and thoroughly trained in hypnotic programming techniques. The effects of 4 types of interventions on an experimentally induced obsessional thought serving a defensive or nondefensive function were compared. For the 1st 5 sec of each trial, the S was led to consciously experience obsessive concern over her mother's well-being, accompanied by an unconscious violent or nonviolent antecedent. Then 1 of these 5-sec interventions followed: (a) a posthypnotic "blank mind" in which there were no thoughts, feelings or sensations; (b) a "substitute thoughts" condition; (c) an aversive white noise; and (d) a control procedure in which the S was told simply to think about anything that came to mind. Each trial ended with a 20-sec free period for spontaneous thought. The blank mind intervention was found to be most consistently effective in immediately eliminating the obsession and in reducing its spontaneous recurrence in the free period. There were no differences associated with the violent vs nonviolent antecedent. Clinical and research implications of these findings are discussed. (German, French, & Spanish summaries) (25 ref)—*Journal abstract.*

2714. Bryan, William J. **Age regression before birth.** *Journal of the American Institute of Hypnosis*, 1974(Jan), Vol 15(1), 35-37.—Discusses the appropriate use of age regression beyond the moment of birth in the treatment of certain psychoneurotics and other patients.

2715. Bryan, William J. **The techniques of age regression, progression, and time distortion.** *Journal of the American Institute of Hypnosis*, 1974(Jan), Vol 15(1), 21-31.—Discusses techniques employed in both the memory and revivification types of age regression. These techniques are described in detail and include railroad, calendar, emotion, clock, and spontaneous regression. Automatic writing, age progression, and time distortion are also reviewed.—*L. M. Croghan.*

2716. Frankel, Fred H. (Beth Israel Hosp, Psychiatry Service, Boston, MA) **Physical symptoms and marked hypnotizability.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Oct), Vol 23(4), 227-235.—Individuals with a marked trance capacity respond in terms of this capacity not only following a formal hypnotic induction procedure, but also spontaneously. A doctor-patient relationship involving repeated helpful encounters which include numerous leading questions might be complicated by such a trance. 2 case histories are presented (a 34-yr-old male and a 48-yr-old female) which illustrate how an unusual trance capacity can be mobilized to help the patient experience events resembling his distressing symptoms under controlled circumstances. This mastery over symptoms provides a new coping mechanism within the framework of psychodynamic psychotherapy. This use of hypnosis involves neither suggesting away symptoms nor uncovering-inter-

native techniques. It is hypothesized that unusual trance states can also be a potential personality responsible for the development of symptoms. (German, French, & Spanish summaries)—*Journal abstract*.

2717. Howland, John S. (Richard H. Hutchings Psychiatric Ctr., Syracuse, NY) **The use of hypnosis in the treatment of a case of multiple personality.** *Journal of Nervous & Mental Disease*, 1975 (Aug), Vol 161(2), 138-142.—Reviews the literature regarding the use of hypnosis in the therapy of multiple personality. Cautions of other authors are noted which intend to protect the patient from further "splitting" of the personalities involved. A case of a 25-yr-old woman is described in which, several months after leaving therapy abruptly, a 2nd personality appeared and prompted her re-entry into treatment. Hypnosis was employed several weeks after restarting therapy on 4 separate occasions. Therapeutic outcome was favorable with coalescence of the personality into a new whole. A rationale for the use of hypnosis in this case is presented—*Journal abstract*.

Speech Therapy

2718. Haskell, Rochelle J. & Larr, Alfred L. **Psychodramatic role training with stutterers.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 30-36.—Studied the impact of a role training program on 6 stuttering and 6 nonstuttering male prisoners. Before and after ratings of the effects of severity of stuttering on oral reading were compared. Because stuttering is considered a form of speech hesitancy in choosing between alternate ways of expressing oneself, the program was designed to promote verbal spontaneity. Roles explored included stranger, group member, fellow worker, employer, and family member. Results indicate all Ss improved considerably in their ability to read an essay onto tape. (20 ref)—*R. Tomasko*.

Health Care Services

2720. Davenport-Slack, Barbara. (Boston Coll) **A comparative evaluation of obstetrical hypnosis and antenatal childbirth training.** *International Journal of Clinical & Experimental Hypnosis*, 1975 (Oct), Vol 23(4), 266-281.—Compares obstetrical hypnosis and antenatal training methods in terms of philosophy, methodology, and successful outcome. A review of previous studies fails to show any differences between hypnosis and antenatal training in terms of outcome (labor length, medication requirements, overt behavioral signs of pain, subjective reports of pain, and experiential childbirth testimonies). Claims that hypnosis and antenatal training result in less medication, calmer behavior, and more positive childbirth experiences are supported. There are little data to support claims that either hypnosis or antenatal training reduces labor length or reduces the experience of pain. Future studies are needed which correct a number of methodological flaws before conclusions can be drawn concerning the specific training factors that influence childbirth outcome. Such preparation factors as relaxation, breathing training, and

verbal suggestions may be less important than factors such as doctor and staff attitudes. The most important factor may turn out to be the woman's desire and ability to participate in childbirth. (German, French, & Spanish summaries) (68 ref)—*Journal abstract*.

2721. Firman, Gregory J. & Goldstein, Michael S. (U California, Los Angeles) **The future of chiropractic: A psychosocial view.** *New England Journal of Medicine*, 1975 (Sep), Vol 293(13), 639-642.—An overview of chiropractic, with an analysis of its social functions, and a projection of its future indicates that chiropractic is more congruent with the values of its lower-middle-class clientele than is orthodox medicine. Chiropractors function adequately to legitimize their patients' entrance into the "sick role" and to provide an alternative channel of therapy. The marginal role of the chiropractor in the health-care system, as compared to that of the physician, is stable and functional for the chiropractors themselves, as well as for their patients. Chiropractic likewise serves the physician, both as a boundary-defining mechanism and as a means of disengagement from troublesome patients. For these reasons, it is concluded that the role of chiropractic within the health-care system will remain stable in the future. (28 ref)—*Journal abstract*.

2722. Gallagher, L. B. **The use of hypnoanesthesia in tattoo removals: Age progression studies in the selection of candidates for cosmetic surgery.** *Journal of the American Institute of Hypnosis*, 1974 (Jan), Vol 15(1), 18-20, 31.—Describes the successful use of hypnoanesthesia in the removal of more than 4,000 tattoos in approximately 1,500 patients. It is suggested that hypnotic age progression may serve as a guide in the selection of candidates for tattoo removal and in the identification of those patients who are inclined toward recidivism in the use of tattoos.—*L. M. Croghan*.

2723. Jones, Kathleen et al. (U York, Heslington, England) **Opening the door: A study of new policies for the mentally handicapped.** London, England: Routledge & Kegan Paul, 1975. xviii, 260 p.—Surveys the changes which have taken place in Britain since 1969 in policies and problems in services for the mentally handicapped. Hospital provision, with special attention to nursing attitudes and problems of the "back ward," the relationship between hospitals and their surrounding communities; and the development of local authority social work and residential care services are discussed.

2724. Lee, Robert H. **Medical rehabilitation: Policy-making in the English health service.** *Social Science & Medicine*, 1975 (Jun), Vol 9(6), 325-332. Describes recent proposals for the development of medical rehabilitation in England, and examines the influence of the medical profession on the fact that the proposals were not accepted into official policy. A central feature of the plan was to establish hospital consultants in rehabilitation. (46 ref)

2725. Loo, H. et al. (Hôpital Ste Anne, Service hospitalo-universitaire de Santé mentale et de Thérapeutique, Paris, France) **[Pharmaco-clinical interest in the study of the lithium 24 hour cycle.]** (Fren) *Encephale*, 1975 (Feb), NS Vol 1(2), 97-111.—Reports that morning lithium concentration is an unreliable indicator of its concentration during the balance of waking hours, since an insufficient morning level may compensate during the

day. Serum lithium varies consistently during the day for individual patients.

2726. Mayer, Morris F. (Case Western Reserve U. School of Applied Social Science) **Program evaluation as a part of clinical practice: An administrator's position.** *Child Welfare*, 1975(Jun), Vol 54(6), 379-394.—Considers the relationship between accountability and program evaluation. The importance of linking program evaluation and clinical practice so the practitioners have an integral part in the evaluation is noted. 5 reasons for practitioner resistance are presented along with the components necessary to evaluate a program (including objectives, target population, treatment methods, effectiveness, and efficiency). Proposals for program evaluation and university-based evaluative research are made.—R. Tomasko.

2727. Pearlmutter, Deanna R. (Columbia U) **Toward a definition of emotional support.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2279.

2728. Phan, Quang Dan. **Needs of children in South Vietnam.** *Carnets de l'Enfance*, 1975(Apr-Jun), No 30, 89-90.—Specifies the types of programs and services needed for children in South Vietnam, with special reference to socioeconomic problems resulting from the protracted war. / M. Cantwell

2729. Ringel, Erwin. (Allgemeines Krankenhaus, Vienna, Austria) [The problem of death repression in medical training.] (Germ) *Dynamische Psychiatrie*, 1975, Vol 8(3), 143-158.—The repression of death and dying puts medicine in a paradoxical situation. Its objective is to struggle against death and yet to remove it from its practice and research. However, in the struggle with the physical means to conserve life, medicine does not deal with the physician's feeling of omnipotence. Thus dying must be denied since it creates feelings of failure, and events of death and dying are excluded from the domain of the working through of more adequate reality. This denial may have catastrophic consequences for the physician who feels like a failure when a patient is dying and may try to escape by leaving the dying patient alone. The moribund is excluded from human community and sympathy while his physiological functions may be preserved, and he may be submitted to an objective medical technology which draws the attention away from the existential necessity of self-reconciling dying. H. Bruml.

2730. Veninga, Robert. (U. Minnesota, School of Public Health) **The management of organizational change in health agencies.** *Public Health Reports*, 1975(Mar-Apr), Vol 90(2), 149-153.—Presents an approach derived from organizational development theory for changing health organizations.

2731. Room, Robin. (U. California, School of Public Health, Berkeley) **Minimizing alcohol problems.** *Alcohol Health & Research World*, 1974(Fal), Exp Issue, 12-17.—Argues that it is unrealistic to think of "preventing" alcohol problems, since the term assumes that these problems can be eradicated or reduced to negligible dimensions. In actual fact, preventive efforts are tolerated only so long as they do not clash with substantial economic interests or cherished beliefs. A more realistic goal would be the minimization of alcohol problems. A number of approaches to minimization are discussed:

tion (direct or indirect control of the availability of alcohol); measures which deter specific behaviors (control of the individual by legal sanctions); measures which identify or treat behaviors or conditions (la... individuals for treatment programs); education and persuasion (messages of all kinds to the public, aimed either at drunken behavior or social conditions); provision of alternatives to drinking behavior (encouragement of substitute activities), and provision of insulations on behavior (time and place boundaries for drinking occasions). It is concluded that policies for minimizing alcohol problems must balance strategies to limit individual health problems and strategies to limit the social problems associated with drinking. (33 ref)—J. Davis

2732. Schulberg, Herbert C. & Baker, Frank (Eds.). (United Community Planning Corp. Boston, MA) **Developments in human services: II.** New York, NY: Behavioral Publications, 1975. x, 404 p.—Presents a series of studies on social values, economic influences, and integrated human services; development of program models for the human services; and the development of human services in new communities. Among the topics discussed are the use of manpower, mental health services and subsystems, and future expectations and realities.

2733. Thompson, M. G. (London Psychiatric Hosp. (Canada)) **Collaboration in the field of human services: A proposed model.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 291-297.—Advocates the creation of human service councils to coordinate the work of health, education, welfare, and justice agencies, as they deal with mental health problems. Such a council would set policies, would co-opt staff members of the agencies to work at mental health tasks, and would set up a central intake service for bringing clients into the service delivery apparatus. (French summary)—F. Auld.

2734. Unwin, John R.; Steinhauer, Paul D. & Conna, Sherrill A. (McGill U. Allan Memorial Inst of Psychiatry, Montreal, Canada) **Symposium: Youth in the community.** In A. B. Tulpan, C. L. Attneave & E. Kingstone (Eds.), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Discusses (a) contemporary youth as it presents itself in hospital-based or private outpatient clinics, (b) the effects on adolescents' lives of their premature separation from the family, and (c) the positive and negative impacts of the ecology on mental health.

Community Services & Mental Health Programs

2735. ———. **A community-oriented center for severely and profoundly retarded children: Elisabeth Ludeman Center, Park Forest, Illinois.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 667-670.—Describes a 3-yr-old community center which has developed programs that give the residents a high level of interaction with direct-care staff members and with the community. Features of the program include small groups of children living together in 4-bedroom homes served by the center, vocational training for high school students, the use of the center's facilities by community

residents, and an audiovisual service for inservice training and staff communication.

2736. ———. **A rural mental health delivery system: Four Corners Community Mental Health Center, Price, Utah.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 671-674.—Describes how the staff of a community mental health center, designed to provide services to a vast, sparsely populated multiethnic region whose residents had no previous experience with mental health programs, set up a diverse delivery system using 2 central offices, 9 satellite clinics, and a psychiatric wing at a general hospital. Outreach workers and indigenous volunteers help bridge the cultural barriers and take the services to the people.

2737. Adams, Chester P. & McCloskey, Jack. (Twice Born Men, San Francisco, CA) **Twice born men.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Discusses the post-Vietnam syndrome in veterans, manifested by job instability, difficulties in relating to other people, depression, social alienation, anger and resentment, emotional irritability, poor control over aggression, alcoholism, and drug addiction. Efforts at therapeutic readjustment are examined.

2738. Allan, John. (U British Columbia, Vancouver, Canada) **A baby clinic in an elementary school: Towards an integration of school, family, and community life.** *Canadian Counsellor*, 1975, Vol 9(2), 102-111.—Describes how a public health nurse established a baby clinic in an elementary school and the effects it had on family, school, and community life. The nurse responded to the lack of community facilities for young mothers by encouraging the mothers to develop their own program. Involvement of the 6th and 7th graders and the role of the counsellor is noted. Other suburban communities are encouraged to devise and implement their own models. (French summary)—*Journal abstract*.

2739. Au-Yeung, Benjamin. (U Pittsburgh) **A study of citizen participation in a community mental health center.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2033.

2740. Bartoletti, Mario D. (York U, Div for Studies in Human Relations, Toronto, Canada) **Family life centres for rural and semi-rural communities.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 27-36.—Describes and evaluates the effectiveness of a multiservice center with strong community links. Services provided include counseling, sex education, training internships, and play therapy. The development of reciprocity in the relationship between client and therapist is encouraged. (16 ref)

2741. Bergman, Robert L. (Indian Health Services, Albuquerque, NM) **The medicine men of the future: Reuniting the learned professions.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Discusses ways in which it might be wise and expedient for the successors of modern psychotherapists to emulate the Navajo medicine men. The most valuable treatment rendered by the medicine men is seen as that of pastoral care.

2742. Brounstein, Dale A. & Johnson, Homer H. (Loyola U, Chicago) **Readability of community mental health center brochures for client consumption.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 193-195.—16 Chicago community mental health centers were solicited for brochures explaining the client services they provided. 9 centers had prepared brochures and these were submitted to a readability analysis. Results indicate that 1 required a 6th-grade education to be understood, 1 required some high school, 3 required a high school education or some college, and 4 required a college education. Recommendations are made to improve the readability of materials for lower educational level target groups.—*Journal summary*.

2743. Burrue, Grace & Chavez, Nelba. (La Frontera, Tucson, AZ) **Mental health outpatient centers: Relevant or irrelevant to Mexican Americans?** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Examines the reasons Mexican-Americans do not make extensive use of mental health facilities. Some reasons are given for lack of use of these facilities: (a) Mental disorders among Mexicans are less visible. (b) Many facilities are located too far from the Mexican-American community. (c) Mexicans attach shame and stigma to mental illness. (d) Services are provided by the Anglo majority. (1½ p ref)

2744. Curtis, W. Robert. (Massachusetts Dept of Mental Health, Taunton Area Mental Health Program, Middleboro) **Community human service networks: New roles for the mental health worker.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.

2745. Doyle, Marie. (U Alaska, Anchorage) **Emerging community profiles.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 103-161.—Describes the rationale, functions, and goals of community transaction theory and community transaction analysis (CTA). The theory is used to predict patterns of transactions among people and to develop an intervention strategy by understanding the complex nature of the community within which each individual develops. The theory is based on a systems approach and conceives of community as an ecological system in which change can be brought about and a growth producing climate maintained. CTA is used experimentally to assess patterns of transactions within a community and to study an individual's transactions in relation to the total community pattern. The role of the change agent working within a community, his or her appropriate skills, and the application of data collection and interpretation procedures to work with individuals and groups in the community are described. Detailed instructions on CTA are also provided. (142 ref)—*L. Gorsev*.

2746. Flester, Alan R.; Silverman, Wade H. & Beech, Robert P. (Community Mental Health Ctr of Palm Beach County, West Palm Beach, FL) **Problems involved in delivering emergency services in a hospital-based community mental health center.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 188-192.—A comparison between 269 catchment area residents and nonresidents who received services at a hospital-

based community mental health center was performed on a number of case opening, demographic, and intervention variables. 4 of the 7 case opening, and none of the demographic, and all 4 intervention variables significantly differentiated the 2 groups. Results indicate the existence of a bifurcated system of services for these 2 groups of consumers. The difficulties in adequately serving the needs of a geographically defined bloc of persons (i.e., catchment area) while operating out of a hospital-based program are noted.—*Journal abstract.*

2747. Katz, Arlene & Guthrie, Andrew. (Mystic Valley Community Mental Health Ctr, Concord, MA) **Pediatric paradox: Adolescents as change agents in the family.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Reports on a collaboration between a family physician and a consulting psychologist that has, so far, surmounted many interdisciplinary barriers and provided an effective model for community mental health intervention. Case studies of 2 15-yr-old girls are described.

2748. Maris, Ronald; Connor, Huell E. & Matthews, Daryl. (U South Carolina) **Slipping between the therapeutic cracks: The psychiatric non-respondent after crisis consultation.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 360-366.—Studied characteristics of patients in a psychiatric crisis who did not return for further treatment after an initial request for emergency care. 200 consecutive outpatients who came to an emergency unit were interviewed and given a questionnaire to obtain data about treatment, history, demography, family background, and concepts of death. About 50% of these patients did not return after their initial contact, and about 32% of these nonrespondents were followed up by interviews with themselves or relatives. Compared with respondents, the nonrespondents were slightly younger, were more often male, more often single, and were about the same on racial proportions. Nonrespondents had more drug-related problems, were slightly more self-satisfied and reported less difficulty in getting along with others. More nonrespondents claimed they did not need therapy. It is concluded that there are 4 primary reasons for the failure of nonrespondents to continue in therapy: nomadism, negative professional reactions, label avoidance, and having interpersonal resources.—*C. McCreary.*

2749. Mehryar, Amir & Khajavi, Farrokh. (Harvard U, Medical School, Boston) **Some implications of a community mental health model for developing countries.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 45-52.—Discusses problems related to socioeconomic change, urbanization, and industrialization that are expected to result in difficulties in psychosocial adjustment. A modified community mental health model is seen as best serving the needs of developing nations. (35 ref)

2750. Moen, Marilyn; Bogen, Dennis & Aanes, David. (Lakeland Mental Health Ctr, Fergus Falls, MN) **Follow-up of mentally retarded adults successfully and unsuccessfully placed in community group homes.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 754-756.—Compared 72 retarded adult patients who had been successfully placed in group homes in the community

with 13 patients who had been placed but rehospitalized (age range for both groups, 22-70 yrs). No significant differences were found between the groups on the 4 variables of sex, age at the time of the study, age at 1st admission to the hospital, and time spent in the hospital. A comparison of preplacement problems listed in the patients' hospital records with the reasons for rehospitalization of the unsuccessfully placed group suggests that both hospital staff and group home parents find aggressive behaviors a problem, but that group home parents are more concerned than hospital staff with deficiencies in self-care.—*Journal abstract.*

2751. Papp, Peggy; Silverstein, Olga & Carter, Betty. (Nathan W. Ackerman Family Inst, New York, NY) **Preventive work with "well families": New methods and techniques.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.

2752. Sandhu, H. S.; Ridick, Robert J. & Parent, Elmer K. (VA Hosp, Bedford, MA) **The community care program: An answer to the challenge of community "back wards."** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls.* University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.

2753. Skilbeck, William M. (U California, Los Angeles) **Attributional change and crisis intervention.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 371-375.—Presents a case study illustrating the role that causal attributions can have in the development and maintenance of a crisis. It is suggested that existing crisis intervention techniques can produce attributional changes and that attribution therapy complements crisis intervention.—*C. McCreary.*

2754. Spratlen, Lois P. (U Washington) **A black client group in day treatment.** *Perspectives in Psychiatric Care*, 1974(Oct-Dec), Vol 12(4), 176-182.—Describes the operation of two day-treatment mental health programs in Los Angeles with special reference to one Black client group. Fundamental to the application of milieu therapy and to the adaptation of medical approaches is an understanding of the culture and life-style of the clients. Activities provided include occupational therapy, psychodrama, nutritional therapy, recreational therapy, social events, and daily community meetings. Discussion of the milieu covers the physical environment, the structure of activities, the atmosphere, and communication.—*M. L. Hogan.*

2755. St Clair, Catherine H. (Hahemann Community Mental Health-Mental Retardation Ctr, Philadelphia, PA) **Short-term follow-up after brief inpatient treatment.** *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 741-744.—110 patients (mean age, 35.9 yrs) admitted to the inpatient unit of a community mental health center were followed up between 90 and 120 days after discharge to determine their level of functioning after an average hospital stay of 21 days. All but 5 of the patients were referred for aftercare, and 80 received outpatient or day hospital care after their release. 16 patients were readmitted to inpatient care within 90 days after discharge. The patients' social and community adjustment at follow-up, based on information obtained from aftercare therapists, is described.—*Journal abstract.*

2756. Stein, Sherry. (ENKI Research Inst, Encino, CA) **An earthquake shakes up a mental health system.** In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.—Reports findings of a study made following an earthquake which severely damaged a mental health center housing 150 inpatients. It is concluded that disaster preparedness should include planning for individuals and community organizations to deal with immediate and delayed emotional stress to minimize trauma after emergency situations.

2757. Talbott, John A. & Godbey, Vivian H. (Payne-Whitney Psychiatric Clinic, New York, NY) **The second-in-command syndrome.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 659-661.—Discusses role problems of individuals who are second in command in organizations. A hypothetical example of the relationship of a first-in-command and second-in-command in establishing a day hospital is presented, and the need to define boundaries on the basis of skills and personality variables and to respect individual identity is discussed.

2758. Tulipan, Alan B.; Attneave, Carolyn L. & Kingstone, Edward (Eds). (William Alanson White Inst of Psychiatry, Psychology, & Psychoanalysis, New York, NY) *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.

2759. Wirth, Marlon G. (U Arizona) **Counselor positive mental health as a factor in group participants' growth.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1634.

2760. Wolkon, George H. (U Southern California, Medical School) **Changing roles: Crises in the continuum of care in the community.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 367-370.—Presents a theoretical discussion of the application of the crisis model to the understanding of the process and role changes involved in the initial phase of seeking for help in the mental health system.—C. McCreary.

Counseling & Social Casework

2761. Aldridge, Martha J. & Cautley, Patricia W. (Kirkwood Community Coll) **The importance of worker availability in the functioning of new foster homes.** *Child Welfare*, 1975(Jun), Vol 54(6), 444-453.—Studied ways a social worker can use limited time resources most effectively in foster home placements. Tape recorded interviews were conducted with 115 new foster parents caring for 6-12 yr old children and with the placement worker. Results indicate that the success of a placement in a new foster home depends on the social worker's characteristics, the amount and kind of preparation given to the new parents, and the availability of the worker during the placement.—R. Tomasko.

2762. Main, Allen P. & Roark, Albert E. (South Junior High, Aurora, CO) **A consensus method to reduce conflict.** *Personnel & Guidance Journal*, 1975(Jun), Vol 53(10), 754-759.—Describes a 5-step model of conflict reduction suitable for use by practicing counselors. The model is presented in a how-to-do-it fashion and supplemented with illustrations. The reactions of 8 counselors who used the model in 37 conflict cases are

described, along with the responses of the persons involved in the conflicts.—*Journal abstract*.

2763. Smiley, Charles W. (U Calgary, School of Social Welfare, Canada) **The flower children of Ontario.** *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 279-283.—Describes a summer program for providing social work services to a counterculture group in a small northern Ontario community. An informal evaluation of the effects of this program is presented.

2764. Wilson, Charles J. (Temple U) **The effects of time-limited group counseling on the level of functioning of chronic home hemodialysis patients.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1633-1634.

Hospital Programs & Institutionalization

2765. Abruzzi, William. **Severe personality disorders in an institutional setting.** *American Journal of Psychoanalysis*, 1975(Fal), Vol 35(3), 269-277.—Describes a program for the treatment of delinquent children and young adults with severe personality disorders in a residential setting. Characteristic behavior patterns are discussed, and the traditional therapeutic approach is criticized. It is maintained that the most effective approach to the rehabilitation of these patients involves a well-structured therapeutic program based on the clarification of immediate reality and a combination of interpretation and limit-setting. This program emphasizes the verbalization of frustration, anger, and conflict, and stresses the development of insight followed by positive behavior modification.—J. Adams-Webber.

2766. Dowling, Scott. (Bellefaire Residential Treatment Ctr, Clinical Services, Cleveland, OH) **Treatment in cottage programs for children with severe developmental disturbances.** *Child Welfare*, 1975(Jun), Vol 54(6), 395-405.—Describes the influence of a cottage living program on children with severe personality disturbances. The unfamiliarity of psychiatry with the impact of group living is considered, and the concept of developmental disorders is offered as a complimentary explanation to the psychiatric model of unconscious conflict. The program is distinguished from family life and therapy groups. Its fundamental characteristic is the number of long-continued, 2-3 yr relationships with peers and staff. Group cohesiveness within the cottages is discussed, and a clinical example presented.—R. Tomasko.

2767. Flouriot, Marie. (U Rochester) **The residential ward as a verbal environment.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2595-2596.

2768. Folsom, James C. & Folsom, Geneva S. (VA, Rehabilitation Medicine Service, Washington, DC) **The real world.** *MH*, 1974(Sum), Vol 58(3), 29-33. Discusses the institutionalized world of the aged and attendant policies of staff. The retraining of staff members in open systems of communication with patients, (e.g., reality orientation and attitude therapy) is suggested. Examples of the use of reality orientation and attitude therapy are provided.—B. E. Allen.

2769. Franklin, Jack L.; Kittredge, Lee D. & Thrasher, Jean H. (State Dept of Human Resources, Management Information Systems, Raleigh, NC) **A survey of factors**

related to mental hospital readmissions. *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 749-751.—107 patients (mean age, 41.5 yrs) selected at random from those discharged from a southern state mental hospital in fiscal year 1972-1973 were followed up. An attempt was made to differentiate those who were readmitted to the hospital from those who were not on the basis of 52 factors, both personal and environmental, and to compare those who misused alcohol with those who did not. 36 patients returned to the institution and 71 did not. Findings show that in both the total sample and in the nonalcoholic subsample, those readmitted more often received income from sources other than their own employment or the employment of someone in their household. They also tended to be single, separated, or divorced. In both the alcoholic and nonalcoholic subsamples, those readmitted reported more contacts with the community mental health center after their discharge than those not readmitted. In the total sample, the readmitted patients engaged in fewer leisure-time activities and were more likely to report a drinking problem. (16 ref)—*Journal abstract*.

2770. Heinemann, Shirley H.; Yudin, Lee W. & Perlmutter, Felice. (W Philadelphia Community Mental Health Consortium, Philadelphia, PA) A follow-up study of clients discharged from a day hospital aftercare program. *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 752-754.—Assessed levels of social and individual functioning of 61 25-76 yr old former clients of a day hospital aftercare program. Results of the Katz Level of Free Time Activities Scale, Katz Level of Performance of Socially Expected Activities Scale, and the Brief Psychiatric Rating Scale show that Ss were more like psychiatric patients than like the normal population. Marital status and type of residential arrangement were the only demographic variables that could be correlated with level of functioning. Married clients functioned better than those who were not married, and boardinghome residents were significantly more impaired than those in other living situations. Although data do not permit conclusions about the effectiveness of the aftercare program, the need for improved conditions in boarding homes is suggested.—*Journal abstract*.

2771. Hojer-Pedersen, Willy. (Kommunehospitalet, Copenhagen, Denmark) The centenary of the psychiatric department of Kommunehospitalet, Copenhagen (1875-1975). *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 7-14. Describes the historical and organizational development of the 1st psychiatric department in a general hospital in Copenhagen.

2772. Kosberg, Jordan I. (Florida State U, School of Social Work) Methods for community surveillance of geriatric institutions. *Public Health Reports*, 1975(Mar-Apr), Vol 90(2), 144-148.—Argues that cooperation between the community and geriatric institutions can be achieved in 4 ways: (a) by means of formal can be achieved in 4 ways: (a) by means of formal federal, state, and local policies with which these institutions must comply; (b) with the aid of staffs of community organizations; (c) through institutional visits and the support of professionals; and (d) through follow-up visits paid by family members and friends and by

professionals and others who originally referred the residents to the institution.—*M E Pounsel*

2773. Lawrence, Carl W. (U Texas, Austin) The relationship between climatological and behavioral variables among profoundly retarded males. *Communication Abstracts International*, 1974(Nov), Vol 34(5-A), 2423-2424.

2774. Maier, Henry W. (U Washington, School of Social Work, Seattle) Learning to learn and living to live in residential treatment. *Child Welfare*, 1975(Jun), Vol 54(6), 406-420.—Discusses issues related to child care within group living situations, with emphasis on the interpersonal involvement of the staff with the children. Issues considered include primary life in group care, everyday engagements, use of interpersonal association as a behavior-shaping process, the rehearsal approach in group living, and the linking of group experiences with those that must be mastered in "real life." Secondary forces relating to the impact of the institution's policy and power structure on the development of group life as a minisociety are reviewed, focusing on power distribution and the worker's power status. (24 ref)—*R. Tomasko*.

2775. Main, Thomas F. (Cassel Hosp, Richmond, England) [The hospital as a therapeutic institution.] (Ital) *Archivio di Psicologia, Neurologia e Psichiatria*, 1974(Oct-Dec), Vol 35(4), 446-452.—Presents a translation of a 1946 article about the Northfield experiment in group therapy that indicated the need to include the whole hospital in a therapeutic effort.

2776. Maurey, Gilbert. [The displaced psychiatrist.] (Fren) *Etudes Psychotherapeutiques*, 1975(Mar), No 19, 39-46.—Sketches the author's reactions to his work as a psychiatrist in the emergency room of a general hospital. Compared to regular psychiatric cases, those in the emergency room involve a remarkable frequency of suicide attempts utilizing drugs. Such attempts may be considered communications about intolerable life situations. Emergency room patients requiring resuscitation show phenomena of affective regression and of perceptual distortion. The impact of circumstances on psychological functioning is forced on the psychiatrist's attention by his work in such a setting. (Spanish & Portuguese summaries)—*F. Auld*.

2777. Milby, Jesse B. (U Alabama, Medical School, Birmingham) A review of token economy treatment programs for psychiatric inpatients. *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 651-658.—A review of outcome studies that used control procedures shows that (a) token economies were most effective in modifying inpatient work, personal care, and some psychotic behaviors; (b) studies that assessed token programs to prepare patients for community living and reduce recidivism generally affirmed the effectiveness of token procedures, but were poorly designed and lacked systematic follow-up data; and (c) almost all studies failed to examine possible chemotherapy and token economy interactions. (30 ref)

2778. Pidgeon, Virginia A. (U Minnesota, Graduate Programs) Functions and content of verbal contacts initiated by disadvantaged and advantaged preschool children with adults in a hospital. *Maternal-Child Nursing Journal*, 1974(Win), Vol 3(4, Mono 3), 167 p.

—Studied nature and frequency of verbal contacts with adults by 24 hospitalized preschool-age children as a function of socioeconomic status. So were 7 girls and 5 boys from welfare families (disadvantaged group); and 5 girls and 5 boys from intact middle to upper-class families (advantaged group). Verbal interactions of children with adults were observed and recorded verbatim in structured and unstructured situations. The major findings were that (a) advantaged and disadvantaged children did not differ significantly in the frequency of verbal contacts with adults; (b) most of the verbal contacts (60%) were information requests; approximately 20% expressed wants or requested adult action; 1% related to the experience of feelings; and (c) disadvantaged children talked less about their parents and expressed more wants for adult attention; while advantaged children verbalized more wants for hospital services. It is concluded that both advantaged and disadvantaged hospitalized children can be articulate and verbal in expressing wants, thought, and feelings and in obtaining responses from adults. (78 ref)—D. Edwards.

2779. Priestino, Sandra L. (U South Carolina) An analysis of the effectiveness of the reception and evaluation center environment in producing attitudinal changes of juvenile delinquents. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1626-1627.

2780. Retterer, Russell, F. (U Illinois, Urbana-Champaign) An exploratory study of previously institutionalized adolescents identified as deviant, and their subsequent community adjustment. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 622.

2781. Rumbaut, Ruben D. (VA Hosp, Houston, TX) The hospital of Zaragoza. *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 268-273.—Presents an historical account of the hospital of Nuestra Señora de la Gracia in Zaragoza, Spain, which opened in 1425. This and other hospitals in Spain of that time were noted for their humane care and enlightened treatment of mental patients. The Zaragoza hospital towered above its contemporaries, acting as an example for Europe and the New World by its unique influence on the evolution of psychiatric thought and practice. It functioned for several centuries, pioneering in good care, enlightened treatment, occupational therapy, and common sense in dealing with the mentally ill.—J. Z. Elias.

2782. Singer, Judith E. & Grob, Mollie C. (McLean Hosp, Evaluative Service Unit, Boston, MA) Short-term versus long-term hospitalization in a private psychiatric facility: A follow-up study. *Hospital & Community Psychiatry*, 1975(Nov), Vol 26(11), 745-748.—A follow-up study was made of 43 short-term and 42 long-term ex-patients 18 mo after their discharge from a private psychiatric hospital. The short-term sample was different from the long-term sample on many preadmission and hospitalization variables, but it was much less different on the follow-up variables. Although most ex-patients in both samples were functioning well at follow-up, the long-term sample was doing somewhat better in all areas, according to both the former patients and their nearest relatives. Differences between the improvement of those in the short- and long-term sample increased when tested by diagnosis, with the long-term schizophrenic patients improving the most.—*Journal abstract*.

2783. Soreff, Stephen M. (Maine Medical Ctr, Portland) The impact of staff suicide on a psychiatric inpatient unit. *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 130-133.—A staff nurse on a psychiatric inpatient unit committed suicide. A retrospective study of patients and staff reactions showed that the inpatients dealt openly and effectively with grieving, while staff had a great deal of difficulty with the situation. One of the nurse's outpatients required rehospitalization. Recommendations for more attention to the staff mourning process are made.—*Journal abstract*.

2784. Stine, Diane. Sex education in a psychiatric hospital. *Journal of the National Association of Private Psychiatric Hospitals*, 1974-1975(Win), Vol 6(4), 30-34.—Describes the goals, materials, structure, and results of a course in sex education offered to hospitalized psychiatric patients.

2785. Watson, Carrie M. (U Texas, Austin) The effects of feeding schedule alterations on behavior and weight in profoundly retarded humans. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2426.

2786. Welner, Joseph. (Kommunehospitalet, Copenhagen, Denmark) Practice in the psychiatric department of a general hospital in central Copenhagen: The present and the future. *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 32-34.—Describes a general hospital's psychiatric department whose patients generally represent the lower socioeconomic division of the city. The change of the municipality in which the hospital is located into 4 geographic districts is described. The goal of that change, which was to develop a community service intimately interwoven with the social service agency of the area and to conduct active field work, has not been achieved, and possible reasons for this development are outlined. Future plans for the department include a reception division which will include emergency rooms, a small observation ward of 4-6 beds, and a social worker. It is the intention of this section to keep most of the 1-night patients out of the ward, since it will be possible to treat them during the evening and night on reception, offer acutely needed social assistance, and, if appropriate, send them to work the next morning.—M. E. Pounsel.

Rehabilitation & Penology

2787. Carter, Tena G. (New York U) A study of the effect of behavior modification techniques upon the production, self-evaluation, and vocational adjustment of retardates. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-A), 613.

2788. Csapo, Marg. (U British Columbia, Vancouver, Canada) Verbal and non-verbal reinforcement by staff and peers in an educational rehabilitation setting for delinquents. *Psychology*, 1975(May), Vol 12(2), 19-26.—Evaluated the consistency of 10 staff members' reinforcement schedules as applied to 3 male delinquent 15-17 yr olds. Systematic reinforcement was hypothesized to extinguish peer reinforcement of inappropriate behavior. Changes over time in modalities of communication in peer and staff reinforcement schedules were examined. Glances were the most common reinforcement mode and were applied more often by peers than

staff. Results indicate a marked decrease in inappropriate and increase in appropriate behaviors over a 3-mo period. As the staff increasingly ignored inappropriate behaviors, the peer reinforcement of these behaviors also decreased.—R. Tomasko.

2789. Duto, Kenneth R. (U Northern Colorado) **A history of vocational rehabilitation within the Veterans Administration since World War II.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2291.

2790. Graham, Daniel O. & Riede, Gregory F. (Central Missouri State U) **The effects of a prison pre-release programme on interpersonal behaviour.** *Social Defence*, 1974(Jul), Vol 10(37), 30-34.—Tested the hypothesis that a prerelease treatment program improves the interpersonal behavior of prisoners. 31 inmates were administered the Fundamental Interpersonal Relations-Behavior Scale (FIRO-B) before and after a 6-wk treatment period. Results show that the scale of "expressed control" significantly changed, with no other changes. It is concluded that prerelease treatment gives inmates greater control and ability to make mature decisions.—R. J. Albers.

2791. Haskell, Martin R. (California State U, Long Beach) **The contributions of J. L. Moreno to the treatment of the offender.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 147-156.—Discusses Moreno's image of man, which includes the concept that the offender is similar, psychologically and physically, to the nonoffender and responds to treatment in similar ways. Moreno's contributions to treatment include group therapy, the application of psychodrama to prisoner assignment, the use of psychodrama for diagnosis and therapy, and the use of spontaneity training to prepare prisoners to return to outside society. The failure of many correctional institutions to rehabilitate more offenders is attributed to institutional lack of acceptance of sociometric theory. The prison inmate has already been rejected by society and is treated throughout his stay in prison as a rejectee; the criminal group becomes the prisoner's reference group. A 3-phase plan for phasing out all reformatories and prisons is presented.—R. Tomasko.

2792. Hollander, Sharon L. **Social atom: An alternative to imprisonment.** *Group Psychotherapy & Psychodrama*, 1974, Vol 27(1-4), 173-183.—Presents a sociometric analysis of imprisonment in which inmates are seen experiencing most of their lives through memories and fantasies. Examples are given of the application of a sociatric approach to dealing with prisoners' lack of spontaneous and creative interactions. 3 telic relationships are described in relation to prisoner rehabilitation: the psychological social atom, the collective social atom, and the individual social atom. The psychological social atom consists of the smallest number of people that each person requires to feel complete; the collective social atom is the smallest number of groups or affiliates necessary for an individual to be a member of in order to achieve the same self-completion. (16 ref)—R. Tomasko.

2793. Israel, Alan R. (U Missouri, Kansas City) **Predicting rehabilitation success of ex-mental patients with tests of self-concept and concept of disability.**

Dissertation Abstracts International, 1973(Nov), Vol 34(5-A), 2300-2301

2794. Lowery, Lloyd R. (U Northern Colorado) **Multivariate analysis of clinical and employment variables for psychiatrically disabled vocational rehabilitation clients.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2474-2475.

2795. Maxwell, Val. (Monash U, Clayton, Australia) **Organisation interaction patterns in the rehabilitation of the physically disabled.** *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 68-69.—Conducted a comparative analysis of 3 organizations where intensive therapy and retraining programs were available for young adults. The hypothesis tested was that in rehabilitation, the social and personal characteristics of the actors involved would present themselves as more crucial contingencies for success rates of treatment than physiological symptoms of disease or injury per se.—*Journal summary*.

2796. Murphy, Stephanie. **Expanding horizons for MR's.** *Innovations*, 1975(Sum), Vol 2(2), 21-26.—Discusses new attitudes toward mentally retarded citizens which are changing traditional programs for their training and education, especially the increasing emphasis on allowing the client to take more risks. 4 programs are described at centers which have begun offering more challenging recreational programs for their participants. Programs include a 5-day, 25-mile canoe trip, skiing, backpacking, and other outdoor activities. Most of the participants are experiencing positive learning and growth.—S. Bowser.

2797. Prunty, Odessa. (Sickle Cell Society, Pittsburgh, PA) **Rehabilitation of the sickle cell anemia patient: A new program.** *Rehabilitation Literature*, 1975(Jun), Vol 36(6), 179-181.—Describes a federally-funded 3-agency program designed to assess the vocational potential of patients handicapped by sickle cell anemia. It is geared to provide the essential services needed by such patients to enter the job market, including medical rehabilitation, vocational testing and guidance, tuition for job training, transportation, and books. The project will serve as a model for state vocational rehabilitation agencies throughout the country.—S. L. Warren.

2798. Sweeley, John W. (Community Co!! Baltimore) **On being a correctional counselor: A guide to effective intervention.** *Journal of the Association for the Study of Perception*, 1975(Spr), Vol 10(1), 31-38.—Discusses the relationship that correctional counselors should create with youthful offenders and several critical areas within this relationship. Most offenders have not had positive, meaningful relationships; thus it is crucial to establish this type of relationship if counseling is to stimulate better behavior. The counselor should accord the offender respect as a person, look for repeated and avoided themes, let the offender know the counselor as a person, and make the offender aware of and uncomfortable in his antisocial lifestyle. The goal is to alter the offender's view of himself and the world.—J. M. Kleinman.

2799. Thorne, Frederick C. **Community psychology and correctional reform.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 163-165.—Discusses the failures of the correctional systems and of the new

reforms that are advocated periodically by social critics and prison officials. It is argued that the most destructive influences in any correctional system are the prisoners themselves and that despite humanistic objections to capital punishment, it can provide a final solution to unrehabilitable criminals.

2800. **United Nations Social Defence Research Inst.** *Criminological research and decision making: Studies on the influence of criminological research on criminal policy in the Netherlands and Finland.* *United Nations Social Defense Research Institute*, 1974(Oct), No 10, 220 p.—Presents studies designed to provide a link between research and policy, and to call attention to the ways criminological research is structured and presented to its policy-maker consumers. Research on crime and crime control is rarely reflected in action and often perceived as irrelevant. The Dutch study traces the distribution of research findings among decision makers to determine their attitudes toward the findings and criminological research in general. The Finnish study describes a program of action-oriented studies conducted by government research institute. (112 ref)—*R. Tomasko.*

Drug & Alcohol Rehabilitation

2801. ———. **A unit for delivering multiple drug treatment and prevention services: Connecticut Mental Health Center, New Haven.** *Hospital & Community Psychiatry*, 1975(Oct), Vol 26(10), 663-666.—Describes a multifaceted drug treatment program whose treatment approaches include methadone maintenance, long- and short-term therapeutic communities, a day program for adolescents, and a low-intervention program using narcotic antagonists. Out of approximately 2400 applicants, 1600 have entered treatment, and 550 are considered drug-free program graduates.

2802. ———. **Evaluation system aids in improving treatment.** *Alcohol Health & Research World*, 1974(Fal), Exp Issue, 21-24.—Describes the system used by the National Institute on Alcohol Abuse and Alcoholism (NIAAA) to evaluate the performance of its network of alcohol treatment centers (ATCs). Each center submits a set of completed questionnaires weekly to the Institute, which compiles monthly, quarterly, and special reports from these data. The reports are sent to all ATCs, so that each can compare its operations with those of any other ATC. Suggestions for improvement are offered to individual centers. The value of the reports depends on how closely the ATC staff studies the data and follows the NIAAA recommendations. Benefits of the evaluation system include improved management and accounting procedures, reduction in costs, better use of staff, more community involvement, new efforts to find and treat the hidden alcoholic, a wider range of services (especially follow-up, aftercare, and youth programs), and expanded use of group therapy.—*I. Davis.*

2803. **Becker, Charles E. et al.** (San Francisco General Hosp, Div of Clinical Pharmacology, CA) **Rational drug therapy of alcoholism with sedative hypnotic drugs: Is this possible?** *Annals of the New York Academy of Sciences*, 1975, Vol 252, 379-384. Reviews the evidence for the effectiveness of sedative drug therapy in treating

alcoholism. Results suggest that during the initial detoxification period, these drugs are helpful in diminishing the discomfort of the patient. In subsequent stages, however, there is little research to indicate that such medication will cause the behavioral changes necessary to alleviate problem drinking. It is concluded that additional research is needed before general conclusions as to the overall usefulness of sedative hypnotic drugs can be made.—*R. S. Albin.*

2804. **Bissell, LeClair.** (Roosevelt Hosp, Smithers Alcoholism Treatment & Training Ctr, New York, NY) **The treatment of alcoholism: What do we do about long-term sedatives?** *Annals of the New York Academy of Sciences*, 1975, Vol 252, 396-399.—Presents evidence against the use of long-term sedatives in treating alcoholism. The dangers and contraindications of these drugs are detailed, and the history of their use in alcoholism is described. It is concluded that therapy should not entail substituting one drug (sedatives) for another drug (alcohol).—*R. S. Albin.*

2805. **Bratter, Thomas E.** (Pelham Narcotics Guidance Council, Port Chester Community Action Program, Scarsdale, NY) **From methadone maintenance treatment programs to involuntary electronic behavior control: Legacy of heroin addiction in 1984?** *Corrective & Social Psychiatry & Journal of Behavior Technology Methods & Therapy*, 1975, Vol 21(2), 1-7.—Examines the treatment received by heroin addicts in the US from 1900 to 1975. It is argued that the politics of methadone maintenance represents a conspiracy by physicians and politicians against the addict, often involving large profits for the physician and reelection for the politicians. Furthermore, law enforcement agencies updated surveillance and control devices under the guise of ridding the community of heroin. Despite the scientific uncertainty of methadone treatment, 100,000 individuals are addicted to methadone, and the effects of this treatment on both the addict and the policies of government agencies, businesses, and mental health specialists are discussed. (50 ref)—*J. Sorokac.*

2806. **Cummings, Robert E.** (VA Hosp, Mountain Home, Alcohol Treatment Unit, Johnson City, TN) **A study of characteristics of patients who fail to complete a VA alcoholic treatment program.** *Rehabilitation Literature*, 1975(May), Vol 36(5), 139-141.—Results indicate that dropouts, as compared with those who completed the Veterans Administration alcoholic treatment program, were more likely to be older, unmarried, and less willing to take antabuse (disulfiram).

2807. **Goldfarb, Charles & Hartman, Brady.** (Adult Community Mental Health Ctr, Jersey City Medical Ctr, NJ) **A total community approach to the treatment of alcoholism.** *Diseases of the Nervous System*, 1975(Aug), Vol 36(8), 409-414. Presents a review of psychopathology and withdrawal in alcoholics. The use of disulfiram, milieu, and half-way houses in the treatment of alcoholic patients is described. The role of the community mental health center is outlined, and an extensive description of Palm Beach County's approach to the treatment of alcoholism is explained. This heterogeneous county offers facilities for all types of patients, from the lowest to highest socioeconomic backgrounds. Describes work in the Palm Beach Community Mental Health Center.

fully described. The half-way houses, Alcoholics Anonymous programs, and other outpatient and inpatient treatment facilities are depicted. (18 ref)—*Journal abstract*.

2808. **Kaubin, Brenda J.** (U Pennsylvania) **Sexism shades the lives and treatment of female addicts.** *Contemporary Drug Problems*, 1974(Win), Vol 3(4), 471-484.—Presents a discussion of the under-representation of female drug abusers (including alcoholics) in treatment programs, and of the roots of the under-representation. The discussion is based on a selected review of the literature and on interviews with abusers, administrators, and treatment personnel. Sources of under-representation include (a) men's needs to see women as a source of stability of a home to which to return; (b) women's ability to arrange their lives to camouflage drug abuse; (c) women's ability to obtain money through sexual acts while men commit crimes involving them with the legal system, official statistics, and treatment, often resolved in favor of the former due to guilt; and (d) unsympathetic treatment personnel, both male and female. Females in treatment encounter fewer female-oriented facilities and male-oriented concepts of roles and treatment models. Treatment program recommendations are presented.—*A. K. Hess*.

2809. **Kilmann, Peter R.** (U South Carolina) **Marathon group therapy with female narcotic addicts.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 339-342.—Studied the impact of structured and unstructured marathon therapy on 84 female narcotic addicts, 18-43 yrs old; Ss had an average educational level of junior high school. All therapists were male PhDs in psychology paired with male master's level junior therapists. Impact on the addicts was assessed by the Personal Orientation Inventory, the Adjective Check List, and a measure of self-ideal congruence. When compared with controls, marathon participants had greater self-control and achievement scores. There was evidence of overall therapeutic change. Comparisons between the structured and unstructured conditions showed no meaningful differences.—*C. McCreary*.

2810. **Kissin, Benjamin.** (State U New York, Downstate Medical Ctr, Brooklyn) **The use of psychoactive drugs in the long-term treatment of chronic alcoholics.** *Annals of the New York Academy of Sciences*, 1975, Vol 252, 385-395.—Reviews recent research describing the effectiveness of psychoactive drugs in treating alcoholism. A model for the development of alcoholism in individuals is presented. The "symptom vs disease" issue as relevant to alcoholism is discussed. 2 major studies are reviewed which support the conclusion that chlorthalidopoxide is effective in keeping alcoholics in outpatient treatment. Other forms of treatment—Alcoholics Anonymous, individual therapy, group therapy, behavioral therapy, disulfiram—are discussed in terms of the stage within the model presented during which they are useful. The dangers of psychoactive medicinal treatment are cited. It is concluded that a major indication for the use of psychoactive drugs is the reduction of withdrawal symptoms to a level low enough to permit the alcoholic to achieve abstinence but high enough to motivate him to maintain abstinence. (17 ref)—*R. S. Albin*.

2811. **Lewis, M. J.; Bland, R. C. & Balle, W.** (Alberta Hosp, Alcoholism Unit, Ponoka, Canada) **Disulfiram implantation for alcoholism.** *Canadian Psychiatric Association Journal*, 1975(Jun), Vol 20(4), 283-286.—Reports results of implanting tetraethylthiuram disulfide (TETD) tablets in the abdominal muscle of 13 alcoholic men. At 6-mo follow-up, 7 had not drunk at all and 2 drank less than before. Attempts to measure blood levels of TETD were equivocal, though there was some evidence from a breath test of active TETD 8 wks after the implant. Not one patient who drank alcohol had the acetaldehyde syndrome that would have been expected if pharmacologically effective levels of TETD were present in the blood. The clinical effectiveness of the implant operation can therefore be attributed to a psychological deterrent mechanism. (French summary) (17 ref)—*F. Auld*.

2812. **Panyard, Christine & Wolf, Kenneth.** (Herman Kiefer Hosp, Detroit, MI) **The use of systematic desensitization in an outpatient drug treatment center.** *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 329-330.—Presents a case description of the use of relaxation training and systematic desensitization with a young, male heroin addict who was afraid of withdrawal from methadone. A hierarchy involving fear of being without medication for increasing periods of time was more useful than one involving fear of withdrawal symptoms. A 1-yr follow-up found improvement in other areas of functioning—more confidence, more assertiveness, and improved relationships with females.—*C. McCreary*.

2813. **Soden, Edward W.** **The probation officer and the alcoholic client.** *Journal of Drug Issues*, 1975(Spr), Vol 5(3), 242-247.—Discusses the problems that alcoholism presents in the caseloads of probation and parole officers throughout the country. The need for probation and parole officers to be informed and knowledgeable about alcoholism is emphasized. Suggestions are made concerning the use of constructive coercion, group counseling within the officer's base of operation, and Alcoholics Anonymous, Al-Anon, and Alateen, as well as other helping agencies within the community.—*Journal abstract*.

2814. **Steinglass, Peter.** (George Washington U, Medical Ctr) **The simulated drinking gang: An experimental model for the study of a systems approach to alcoholism: II. Findings and implications.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 110-122.—Tested the hypotheses generated by the author's development of a simulated drinking gang for studying interactional behavior (see PA, Vol 55:Issue 2). The analysis involved individual dyadic, and whole group data from 3 different sources, the Cooperative Task Device (CTD), the commodity dispensing machine, and a breathalyzer (for blood alcohol determinations). 3 groups of up to 6 male 25-50 yr old alcoholics each were Ss. Marked discrepancies in individual and dyadic work performance were found in all 3 groups and there was no relationship between chips earned and chips spent. The "drinking gangs" seemed quite willing to tolerate "freeloading" when it occurred. Role performance at the CTD was inconsistent; individuals for the most part fluctuated in their role performance rather than remaining in a stable role. There was no correlation between

work time at the CTD and either work efficiency or blood alcohol levels. Group members did not pair off into consistent and stable dyads when playing the CTD. Data are inconsistent with all the hypotheses but do help to substantiate, and are consistent with, the concept of the "drinking system."—*Journal abstract*.

2815. **Steinglass, Peter.** (George Washington U, Medical Ctr) **The simulated drinking gang: An experimental model for the study of a systems approach to alcoholism: I. Description of the model.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 100-109.—Describes an experimental model for studying interactional behavior from a systems point of view. The model incorporates a research strategy using both a token economy and a simulation of a naturally occurring clinical phenomenon, the alcoholic drinking gang. The development of the model involved admitting up to 6 alcoholic individuals to a research ward designed to study experimentally induced intoxication. Each study was divided into a 7-day predrinking period, a 10-14 day drinking period, and a 5-7 day withdrawal period. A token economy was established which allowed for (a) a group of chronic alcoholics who wish to go through a drinking experience together, (b) the pooling of resources to purchase alcohol, (c) rules established by the group for sharing whatever alcohol is available, and (d) the opportunity to earn money for the purchase of additional alcohol to keep the drinking experience going. All money or tokens, could be earned only by successful performance at the Cooperative Task Device, a cooperative, 2-person game, and tokens could be used to purchase either alcohol, cigarettes, or TV time. Difficulties inherent in simulated models of natural behavior and in "doing" systems research and a series of hypotheses to explain behavior within the simulated drinking gang are discussed. (16 ref)—*Journal abstract*.

PROFESSIONAL PERSONNEL AND PROFESSIONAL ISSUES

2816. **Ardila, Rubén.** (U of the Andes, Bogota, Colombia) **Roles of the clinical child psychologist in Colombia.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 17-19.—Describes Colombian clinical child psychology: its history as a profession, training methods, and current status, and the settings where it is used.—*W. V. Adams*.

2817. **Bakare, Christopher G.** (U Ibadan, Nigeria) **The clinical child psychologist in Nigeria.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 47-49.—Contrasts Western and Nigerian cultures and differing training and functions of the clinical child psychologist in the 2 societies. *W. V. Adams*.

2818. **Blake, Richard.** (U Nebraska, Omaha) **Counseling in gerontology.** *Personnel & Guidance Journal*, 1975(Jun), Vol 53(10), 733-737. Suggests ways for counselors to be involved in gerontology and considers some of the things counselors and counselor education must do to prepare for work in this area. Counselors can provide direct counseling services, help others who work with older persons, and help change feelings and beliefs about aging and older people. Preparation of the

counselor is encouraged through awareness of prejudices and myths regarding older people, as well as the acquisition of specific information relevant to them. (17 ref)—*Journal abstract*.

2819. **Borup, Carsten.** (Kommunehospitalet, Copenhagen, Denmark) **A twenty-four hour duty: The working day of a young Danish psychiatrist.** *Acta Psychiatrica Scandinavica*, 1975, Suppl 261, 27-31.—The doctors' duty in the psychiatric department at Kommunehospitalet in Copenhagen, like most of the other hospital departments, runs from 8 AM one day to 8 AM the next. The young house officer, therefore, is on duty for a total of 24 hrs. While on duty, the psychiatrist takes care of the acute psychiatric cases in the department's catchment area. If some difficult problem arises, conferences are held with a more experienced senior colleague who is on call from his home and can normally reach the department if necessary within half an hour. The acute work is done partly in the psychiatric department and partly in the general emergency room of the hospital where all new patients are first admitted.—*Journal abstract*.

2820. **Boussat, Michel & Dupuy, Marguerite.** (U Dakar, Senegal) **Intervention or expectation: The psychologist's choice in clinical child psychology in Senegal.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 60-64.—Describes disparities between Western clinical child psychology and the Senegalese culture, and the service opportunities in that country. A case study of an enuretic female adolescent is presented.—*W. V. Adams*.

2821. **Brody, Eugene B.** (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **The right to know: On the freedom of medical information.** *Journal of Nervous & Mental Disease*, 1975(Aug), Vol 161(2), 73-81.—Discusses the legal and ethical aspects of the control of information about health and disease. Issues related to the generation, transmission, and accessibility of medical information and the role of the government in its generation and distribution are also examined.

2822. **Carman, Roderick S.** (U Wyoming) **Training community consultants for system change.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 62-64.—Suggests that training include systems analysis, practicum experiences involving student-initiated activity, and research and evaluation. Problems due to some mental health workers' unwillingness to expand their conceptual horizons beyond theoretical formulations of individual behavior are noted.

2823. **Cath, Stanley H.** (Tufts U, Medical School) **Narcissism and the use of the word "shrink."** *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 209-221.—Discusses the origin, history, and implications of the word "shrink" as used for a psychiatrist. "Shrink" clearly describes in some psychologically satisfying way what a person consciously or unconsciously senses about psychiatrists or analysts, as well as what he fears and possibly hopes for in a therapeutic or transference relationship. The emotional involvement in the therapeutic relationship clearly parallels the tendency to idealize those upon whom one depends too much but who resentfully cherishes. At other times, "shrink" seems to

reflect a unique viciousness projected into the psychiatrist.—J. Z. Elias.

2824. Davidson, Leah. (Bronx VA Hosp, New York, NY) **The way things are: 1975.** *Contemporary Psychoanalysis*, 1975(Jul), Vol 11(3), 349-356.—Discusses 2 central issues: (a) the reciprocal milieu for the support of neurosis, and (b) the shifting kaleidoscope of roles in the interpersonal situation in treatment, and its relationship to the psychoanalytic process, as perceived today by the analyst and the patient. The varied factors that foster neurosis in postgraduate teachers and analysts are examined. Many of these are produced by the institutional climate in psychoanalytic training schools. In the analytic process, roles are not assumed; they struggle for recognition. They are not preordained, but emerge in the interdependent analyst-analysand relationship. A plea is made for honesty with colleagues and patients alike.—M. J. Stanford.

2825. de Trautenberg, Nina R. (Hôpital de la Salpêtrière, Child Psychiatric Clinic, Paris, France) **Clinical child psychology in France.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 24-27.—Describes the distinctions between therapist and psychologist in France, the current professional training of the 2 occupations, and a therapeutic case study.—W. V. Adams.

2838. Fukada, Naohiko. (Doshisha Women's Coll, Kyoto, Japan) **Clinical child psychology in Japan.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 42-44.—Discusses how clinical child psychology, a Western creation, is modified for use in an oriental culture. A brief history of the profession in Japan is presented, with comment on its current status.—W. V. Adams.

2839. Gertler, R. & Ferneau, E. (Boston City Hosp, Psychiatry Service, Mattapan Chronic Disease Hosp, MA) **The first-year resident in psychiatry: How he sees the psychiatric patient's attitudes toward death and dying.** *International Journal of Social Psychiatry*, 1974-1975(Win-Spr), Vol 21(1), 4-6.—Suggests measures which need be taken to counteract the views of psychiatric residents who see their patients as regularly concerned about their own deaths.

2840. Glass, George S. (U Texas, Medical School, Houston) **Incomplete role reversal: The dilemma of hospitalization for the professional peer.** *Psychiatry*, 1975(May), Vol 38(2), 132-144.—Hypothesizes that role reversal—the assumption of a new role diametrically opposed to that previously held—is never complete: vestiges of expectations and behavior from the previous role continue to be noted, and they distort acceptance of the new role by both the individual and the others around him. The careers of 3 psychiatric paraprofessionals who happened to be hospitalized in a psychiatric hospital where they formerly worked, and were treated there by their former peers, are discussed. The implications of incomplete role reversal for the treatment of medical professionals, for the traditionally defined medical roles, and for role theory are noted.—*Journal abstract.*

2841. Graves, Larry H. (Mississippi State U) **The effects of interpersonal communication training on and the interrelationship among the communication ability, the philosophical beliefs and the interpersonal perceptual accuracy of counselor trainees.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2296-2297.

2842. Guion, Robert M. (Bowling Green State U) **Open a new window: Validities and values in psychologi-**

cal measurement. *American Psychologist*, 1974(May), Vol 29(5), 287-296. -Discusses the issue of validity in testing, with reference to new Federal equal employment regulations. Definitions of testing terms are presented and illustrated with examples from a study of packers. Definitions include criterion-related validity, construct validity, and job-relatedness. Validity is not equated with job-relatedness, and criterion-related validity is only conditional evidence of job-relatedness. The importance of considering values in hypothesis determination is stressed. Organizational climate and information content are also considered. (19 ref)—*R. Tomasko.*

2843. **Hafner, Bruce W.** (North Texas State U) **A comparison of the effects of various methods of practicum experiences upon subsequent behavior and skill of counselor trainees.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1614.

2844. **Hammer, Edson G.** (George Washington U) **The roles of professional societies as perceived by members.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 940.

2845. **Hodes, Allen L.** (Fordham U) **The development of an instrument designed to measure the counselor trainee's ability to discriminate among interpersonal behaviors and among phenomenological reports associated with personalities of mild pathology.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2298-2299.

2846. **Hovestadt, Alan J.** (Northern Illinois U) **Effects of a performance objectives based instructional model in counseling practicum upon counselor trainees' levels of effectiveness.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2300.

2847. **Ivey, Allen E. & Leppaluoto, Jean R.** (U Massachusetts, School of Education, Amherst) **Changes ahead. Implications of the Vail Conference.** *Personnel & Guidance Journal*, 1975(Jun), Vol 53(10), 747-752. -Discusses the recommendations of the 1973 conference on the future of applied psychology sponsored by the American Psychological Association and the National Institute of Mental Health. Areas considered include the importance of professionals being aware of and owning their value positions, the encouragement of additional professional training to meet the service needs of the diverse cultural populations served, the creation of service-oriented as well as research-oriented professional training programs, the conduct of both individual and program accreditation, the continuation of professional development, the identification and assessment of psychologists' competencies, and emphasis on primary prevention. (23 ref)—*R. Tomasko.*

2848. **Johnson, James H. & Bornstein, Philip H.** (U Texas, Medical Branch, Div of Child Psychiatry, Galveston) **A survey of behavior modification training opportunities in APA-approved internship facilities.** *American Psychologist*, 1974(May), Vol 29(5), 342-348. -Administered a questionnaire to 103 American Psychological Association approved internship training facility directors to assess behavior modification training opportunities. Results are presented in a tabular format indicating program name, number of psychology staff, their orientations, number of behavioral psychologists, didactic training availability, practice opportunities and

supervision opportunities. Results indicate that opportunities do exist for clinical training in behavior modification at the internship level. Behavior modification is generally perceived as only one aspect of the training necessary for the well-rounded clinician. *R. Tomasko.*

2849. **Jones, Linda G.** (U Missouri, Kansas City) **Computer simulated counseling: An exploratory study in counselor education.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2302-2303.

2850. **Kagan, Norman.** (Michigan State U) **Influencing human interaction: Eleven years with IPR.** *Canadian Counsellor*, 1975(Apr), Vol 9(2), 74-97. -Discusses the development of the Interpersonal Process Recall (IPR) method to train counselors by means of a developmental task strategy. Examples from this film and videotape method are presented, and a study of the method's effectiveness using 36 university students is described. The Counselor Verbal Response Scale was administered and indicated a consistent pattern of change in the Ss' interview behavior. An interpersonal theory for everyday communications is presented, and a communication theory and training model is suggested to explain IPR's effectiveness. (French summary) (30 ref) *R. Tomasko.*

2851. **Kahne, Merton J. & Schwartz, Charlotte G.** (Massachusetts Inst of Technology) **The college as a psychiatric workplace.** *Psychiatry*, 1975, (May), Vol 38(2), 197-223. -Examines how the interplay of certain characteristics of institutions of higher education and of professional and psychiatric orientations results in a role for the college psychiatrist that is excessively overdemanding. To reduce the resulting role strains, practitioners use a number of concepts and practices which have important consequences for the type of service given. These modes of adaptation to workplace requirements generate social and ethical problems which need to be resolved if college psychiatry is to be a forceful agency for human assistance in the colleges of the future. An analysis of college psychiatry is presented, based on a sociologically oriented review of the 60 yrs of literature devoted to the subject and on the detailed examination of the functioning of a college psychiatry service over a period of 3 yrs (23 ref) *Journal abstract*

2852. **Kasschau, Richard A.** (U Houston) **On cautions and help: Some comments.** *Behavioral & Social Science Teacher*, 1975(Spr), Vol 2(2), 48-49. -Describes informational resources available from the American Psychological Association to assist high school teachers of psychology.

2866. Palsi, Anthony T. (Temple U) **Effects of multiplexity, self-confidence and different clients on the verbal, interview behavior of counselor trainees.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1625-1626.

2867. Parrish, Marvin J. (U Nebraska, Medical Coll, Psychiatric Inst, Omaha) **Predoxal training in clinical hypnosis: A national survey of availability and educator attitudes in schools of medicine, dentistry, and graduate clinical psychology.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Oct), Vol 23(4), 249-265.—Mailed postcard questionnaires on the subject of training in clinical hypnosis to all doctoral training programs and internship centers in clinical psychology, dental schools, and medical schools ($N = 353$) which were fully approved by their respective accrediting associations. Considerable interest in hypnotic procedures at both predoxal and postdoctoral levels was shown by all groups (respondents, $N = 313$). Availability of training in hypnosis and favorable attitudes toward it were closely related, and both varied significantly across professional disciplines. The greatest amount of interest in predoxal training, as well as availability of training, was reported by psychologist respondents, but returns from internship centers specializing in the treatment of children ran contrary to this general trend. Medical and dental respondents were more inclined to downplay predoxal work in favor of postdoctoral training. Present findings are compared with results by C. S. Moss et al (see PA, Vol 37:4103), and possible reasons for the observed increase of interest in hypnosis are offered. (German, French, & Spanish summaries) (23 ref)—*Journal abstract*.

2868. Perron, Roger. **Clinical child psychology in France.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 27-30.—Discusses the history and confused current status of clinical child psychology as a profession in France.—W. V. Adams.

2869. Piene, Fiffi. **Clinical child psychology in Norway.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 50-52.—Describes the historical development of clinical child psychology, current training methods and service opportunities. A case study of a psychotic child is presented.—W. V. Adams.

2876. Schrieber, Waltrout. Clinical child psychology in West Germany. *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 30. Reports that clinical child psychology does not exist as a professional specialty in West Germany.—W. V. Adams.

2877. Scorzelli, James F. (U Wisconsin) The evaluation of rehabilitation counselor education programs by graduates. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2313.

2878. Seltzer, Arthur; Moskowitz, Arlene S.; Lucas, Theodore & Moskowitz, Joel A. Welfare recipients as paraprofessionals: Utilization in facility for retarded patients. *New York State Journal of Medicine*, 1975(Apr), Vol 75(5), 751-755. Presents a preliminary report on innovative unpaid training of 154 welfare recipients for employment in patient care positions at a metropolitan state school. Candidate selection procedures included (a) referral by public assistance centers and word of mouth, (b) intensive stress interviews, (c) background evaluation, (d) interpersonal and personal capabilities, and (e) work motivation assessment. Observation and interviews were used to judge program success. The program involved 51 hrs of training in the following topics: (a) paraprofessional careers in mental health, (b) types of mental retardation, (c) observational visits to sites, (d) growth and development of normals and mentally retarded, (e) clinical ward observation, (f) motivational training, (g)

the problems of patients' parents, (h) speech and education therapy of mentally retarded, and (i) human relations preparation for work. Role and behavior models were stressed. Overall turnover rate was 15.8%, compared to 30-45% for similar workers not trained by this program.—P. R. Sweet.

2879. Serafica, Fellicsima C. (U Pittsburgh) Clinical child psychology in the Philippines. *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 53-57.—Discusses the history, current professional status, and professional roles and issues of clinical child psychology in contemporary Philippine society. A case study of an adolescent male is presented.—W. V. Adams.

2880. Seymour, Guy O. (Harvard U, Medical School, Boston) Role problems in community psychology internship training in community agencies. In A. B. Tulipan, C. L. Attneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: University of Alabama Press, 1974. xii, 241 p. \$8.50.

2881. Shapiro, Daniel. (Columbia U, Psychoanalytic Clinic for Training & Research) The training setting in training analysis: A retrospective view of the evaluative and reporting role and other "hampering" factors. *International Journal of Psycho-Analysis*, 1974, Vol 55(2), 297-306.—Reviews the issue of communication between the training analyst and the training institution. The results of a survey of 32 graduates of a training institution regarding difficulties in the training analyst's reporting function are presented, and a model for the training analyst is proposed. (27 ref)—L. Lauro.

2882. Snowden, Lonnie & Cotler, Sheldon. (Wayne State U) The effectiveness of paraprofessional ex-addict counselors in a methadone treatment program. *Psychotherapy: Theory, Research & Practice*, 1974(Win), Vol 11(4), 331-338.—Studied counselor personal characteristics associated with effective counseling of heroin addicts in a methadone treatment program. The counselors, 25 Black former addicts, were given the MMPI, the Intraversion-Extroversion Scale from the Maudsley Personality Inventory, the Social Desirability Scale, and Banta's People in General Scale. Effectiveness was assessed by comparing each counselor's clients with clients assigned to others, and was operationalized as missed medications, absences, and dirty urines each obtained at 3 program steps. The MMPI Scales (? Hs, Pa, Ma) had significant correlations with 1 dependent variable while the other personality measures and social history variables were correlated.—C. McCreary.

2883. Sodetz, Alan R. (U Missouri, Columbia) The effect of videotape microtraining on counselor behavior. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1630-1631.

2884. Thorne, Frederick C. Games psychologists play. *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 175-181.—Presents clinical analysis of the games some psychologists play based on over 40 yrs of experience in treating individual psychologists and in observing psychologists in action in the community. Being in a relatively young science, many psychologists appear to feel deeply inadequate and ineffectual in their community work and have developed a variety of defenses and games to maintain status and to advance their positions. Although based on anecdotal experience with individual

cases, generalized patterns of professional defenses are described and discussed including retreating into existential neurosis, jumping on the professional bandwagon, withdrawing into esoteric positions, and becoming involved in cultism and quackery. *Journal summary.*

2885. Van Ree, F. (Psychiatric Hosp "Vogelenzang," Bennebroek, Netherlands) **The role and training of the auxiliary worker in acute psychiatry.** *International Journal of Social Psychiatry*, 1974-1975(Win Spr), Vol 21(1), 53-61.—Describes the use of social workers as psychiatric auxiliaries in India. Their specific tasks include collecting paramedical and social data, searching for danger symptoms, providing explanations to patients' relatives, and educating people in preventive mental health practices.

2886. Weiss, Avraham A. (Hebrew U, Jerusalem, Israel) **Child psychology in Israel today.** *Journal of Clinical Child Psychology*, 1975(Sum), Vol 4(2), 37-38.—Describes training requirements and service opportunities for clinicians working with children in Israel.—W. V. Adams.

2887. White, Lowell D. & Chavigny, Katherine H. (Medical Dept Activities, Fort Polk, LA) **Direct tape access as an adjunct to learning.** *Nursing Research*, 1975(Jul-Aug), Vol 24(4), 295-298.—Divided 50 junior nursing students in a course in epidemiology into control and experimental groups. The study extended through 3 quarters—fall, winter and spring. Experimental Ss in the winter and spring quarters were given access to 15-min taped summaries of each week's lecture. When midterm and final examination scores were analyzed according to study group, no statistically significant differences between control and experimental group scores were computed, so that the tapes were found to have no effect on learning. However, S satisfaction with the course showed a significant increase.—*Journal abstract.*

2888. Winans, A. Paul. (U Missouri, Kansas City) **The influence of participant dogmatism on counselor and client ratings of counselor effectiveness during the early stages of the practicum counseling relationship.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2318.

2889. Wynkoop, Daniel W. (Brigham Young U) **The application of systems techniques, modules and behavioral objectives to a counselor education model.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1634.

EDUCATIONAL PSYCHOLOGY

2891. Baker, Jeroline A. (North Texas State U) **A study of the attitudes of parents, teachers and principals toward parental involvement in school activities.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1470.

2892. Bunt, Don D. (Chicago State U) **A quantitative comparison of self- vs. group-perceptions.** *Journal*

of the Association for the Study of Perception, 1975(Spr), Vol 10(1), 23-30. Compared self vs group perception of individual's participation in small classes. 2 classes (6 and 9 Ss) of a course on methods of teaching math rated themselves and their classmates on 8 variables related to teaching effectiveness and class participation. The comparison of the self- and group ratings indicates how realistic a student's self-perception is. It is suggested that this method could be applied to a variety of situations (e.g., contract negotiations, teacher evaluation, and counseling).—J. M. Kleinman.

2893. Butler, Broadus N. **Leadership development in higher education.** *Educational Record*, 1975(Win), Vol 56(1), 21-28. Argues that the first priority of leadership is the value judgment of what to do with the massive amount of data that can be collected and generated by technology. Society looks to the educational system to provide the training for such value judgments as well as knowledge itself. Unless the heads of the educational institutions are leaders rather than mere managers, education fails society's expectations.—R. Gutzke.

2894. Carriere, Robert H. (U Massachusetts) **Peer group violence as a factor in the high school dropout problem.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1471-1472.

2895. Churchill, Stacy. (Ontario Inst for Studies in Education, Toronto, Canada) **Restructuring educational R&D in Ontario.** *Interchange*, 1975, Vol 6(1), 49-64.—Analyzes the situation in Ontario and presents a set of specific detailed proposals for discussion. The proposals cannot be applied directly to any other setting, but they do have implications that might make aspects of them useful in other circumstances.—H. E. Yaker.

2896. Grabowski, Stanley M. (Syracuse U) **Motivational factors of adult learners in a directed self-study bachelor's degree program.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1052.

2897. Green, Hal K. (Indiana U) **A study of in-service adult education practices in state mental hospitals.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1052-1053.

2898. Hake, Caron T. (Pennsylvania State U) **The effects of specified written comments on achievement in and attitude toward algebra and geometry.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1700.

2899. Hartup, Willard W. & Lougee, Michael D. (U Minnesota, Inst of Child Development) **Peers as models.** *School Psychology Digest*, 1975(Win), Vol 4(1), 11-21.—Reviews the literature on (a) general effects of peers as models, (b) situational determinants of peer modeling, and (c) peer vs adult modeling effects. It is concluded that peer models are an incomparable educational resource and possess a strong potential for behavior change. More formalized use of peer modeling is suggested. (35 ref)—J. Prus.

2900. Hughes, Mary A. (Arizona State U) **Attitudes of wives of U.S. Army officers in the continental U.S. toward their educational and employment opportunities.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1026-1027.

2901. Kodým, Miloslav. (Pedagogická fakulta, České Budějovice, Czechoslovakia) **[Conceptual symbol identification related to some types of performance.]** (Czec)

Československá psychologie, 1974, Vol 18(2), 115-126.

—Studied the relationship between the level of conceptual symbol identification (CSI) and physical ability as measured by E. A. Fleischman's tests; athletic performance as evaluated by teachers and coaches; school results in Grade 9; and intelligence as measured by D. Wechsler's 1944 test. Both the overall rationale for this study and the CSI test were derived from J. Linhart. Ss were 15-yr-old athletes: 30 hockey players, 10 male gymnasts, and 18 female gymnasts. Either t tests or Pearson r 's were computed between CSI scores and the other abilities. No significant relationship was found with either sports or athletic ability. Positively correlated for hockey players were school marks and total Wechsler scores ($p < .05$). (Russian & English summaries) (21 ref)—P. Babarik.

2902. McKinney, Ann W. (State U New York, Buffalo) A study of the relationship between self concept and achievement of elementary school children with classifications based on the factors of enrollment in Title I schools, race and Aid to Families of Dependent Children (AFDC). *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-A), 69-70.

2903. Morris, Harold G. (U Arkansas) Value transfer relative to socio-economic status of high school students and proximity of the high school to a university campus. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2174-2175.

2904. Narrol, Harvey & Bachor, Dan G. (Ontario Inst for Studies in Education, Toronto, Canada) An introduction to Feuerstein's approach to assessing and developing cognitive potential. *Interchange*, 1975, Vol 6(1), 2-16. —Discusses both the underlying theory and the specific practices used by R. Feuerstein in assessing and developing the learning abilities of culturally deprived individuals. Assessment involves a test battery called the Learning Potential Assessment Device which includes an Organization of Dots test, The Raven Progressive Matrices, the Plateaux Test, and the Representational Stencil Design Test. The training techniques is called instrumental enrichment and consists of a set of paper and pencil exercises dealing with spatial and temporal relations, comparisons, numerical progressions, classifications, and syllogisms. The test problems are worked on jointly by a teacher and a group of students. The training, which takes about 200 hrs to complete, emphasizes the organization of ideas, how to make decisions, how to generalize, and how to describe what has been done. (75 ref)—H. E. Yucker.

2905. Oliveira, João B. (Florida State U) Simulation and analysis of the effects of alternative transition coefficients on student flows. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1138.

2906. Posner, George J. & Strike, Kenneth A. (Cornell U, New York State Coll of Agriculture & Life Sciences) Ideology versus technology: The bias of behavioral objectives. *Educational Technology*, 1975(May), Vol 15(5), 28-34. Suggests that behavioral objectives imply an undesirable educational ideology and should be replaced by an "empiricist approach" which is less rigid. Empiricism, as defined by the authors, requires that educational goals be capable of empirical testing, but

does not require that goals be specific, atomistic, or exhaustive.—C. B. Kreitzberg.

2907. Reiswig, Gary D. (U Pittsburgh) The parent development laboratory: A study of three group education methods and their relationship to parent-child communication. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1054.

2908. Shaheen, JoAnn A. (Northern Illinois U) A study of selected distinguishing characteristics of elementary school children as related to qualities of democratic behavior. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2179.

2909. Sienkiewicz, Henry S. (Michigan State U) A comparative study to determine the relationship between the existing practices of selected middle schools and student performance on a standardized attitudinal measure. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1007.

2910. Slavina, L. S. (Scientific Research Inst of General & Pedagogical Psychology, Moscow, USSR) [The tasks of individualized approach to re-education.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 156-161.—Suggests that a cardinal problem in helping students overcome undesirable habits, negative personality traits, and inadequate interpersonal relations is that the educator and the students may be looking at the same thing from 2 different points of view, which leads to conflict and the failure of the standard educational methods to achieve the desired change. The students' individual differences must be considered in establishing the causes of maladjustment. Specific situations in which the so-called conceptual barrier may arise are considered, and recommendations are made for overcoming such a barrier in the process of re-education. *L. Zusne.*

2911. Stanley, Gordon & Gardner, Godfrey. (U Melbourne, Australia) Independence and originality: Further enquiries into the "all-my-own-work" myth. *Australian & New Zealand Journal of Sociology*, 1975(Jun), Vol 11(2), 72-73. Analyzes degree of independence expected for theses associated with different academic degrees in Australia. Results indicate that unanimity on expecting complete independence in working for a thesis is nowhere approached, except for PhD theses; most respondents do not expect independence in working for honors theses, and the level of expected independence increases from honors (29%) to Masters (61%) to PhD theses (86%). *Journal summary.*

2912. Stiglmeier, Lois M. (State U New York, Albany) Teachers' judgments of pupils' dependence—self-reliance characteristics mode of instruction and their relationship to achievement. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1008.

2913. Stuhlmiller, Emilie M. (Cornell U) The development and use of instruments assess the effectiveness of para-professionals in working with low income families. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1054-1055.

2914. Van Leinsburg, John P. (Northern Illinois U) A study to determine the extent to which the perceptions of intermediate grade students, elementary school teachers, and elementary school principals differed regarding the organizational climate in selected

schools. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1009-1010.

2915. Wernick, Walter. (Northern Illinois U) **Career development can be a lens.** *Journal of the Association for the Study of Perception*, 1975(Spr), Vol 10(1), 17-22. —Introduces to the field of career development the concept of conation, which is the inner urge that moves a person to action and the inner motive that ultimately determines personal choosing. It is suggested that curriculum planners might well explore the relationships between conative energy and the individual's learning of concepts such as the future, change, and adulthood.—J. M. Kleinman.

Educational Administration & Personnel & Training

2916. Allington, Ervin D. (U Utah) **A study of teacher behavior modification resulting from training in practical applications of Guilford's Structure-of Intellect model.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2427.

2917. Barnett, Don C. (U Saskatchewan, Saskatoon, Canada) **The emergence of new concepts for teacher education experience.** *Interchange*, 1975, Vol 6(1), 44-48.—Discusses several alternative types of practicum experiences offered in preservice teacher education. The new concepts include early commitment, decentralization, community experience, teacher-aide transition, and portal schools. (15 ref)—H. E. Yuker.

2918. Batoff, Mitchell E. (Jersey City State Coll) **The unit box approach to elementary school science and mathematics teacher preparation.** *Acta Technology*, 1975(May), Vol 15(5), 9-17.—Describes a technique which has been used in elementary school teacher training. Apprentice teachers assemble unit boxes which contain materials (such as pictures, a tape cassette, work sheets, and evaluation instruments) for use during teaching. (50 ref)—C. B. Kreitzberg.

2919. Belcher, Don. (Auburn U) **A survey of counselor certification standards and counselor participation in certification practices.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2286.

2920. Bernero, James A. (Loyola U, Chicago) **A critical study of the attitudes and reactions of a select group of urban elementary teachers to the concept of community control with a comparison of their reactions to those of administrators and community residents.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1013-1014.

2921. Blumenthal, Darlene & Reiss, Steven. (U Illinois, Chicago) **Do open space environments encourage children to seek immediate gratification?** *Journal of School Psychology*, 1975(Sum), Vol 13(2), 91-96. Evaluated the effects of 14-mo exposure to open space environments on preference for delayed reward. A total of 389 4th and 5th graders in open space and conventional classes were individually administered 1 of 4 tests for delay of gratification. Tests consisted of a choice between an immediate, smaller reward and the delayed, larger reward. Result of each of the 4 independent studies show that approximately the same percent of Ss from each educational environment selected the delayed alternative.—*Journal abstract*.

2927. Corley, David R. (College of William & Mary) **A study of the relationship between secondary teacher satisfaction and attitude toward collective negotiations.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1016-1017.

2928. Dagley, John C. (U Missouri, Columbia) **A taxonomy of counselor education objectives.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1073.

2929. Dash, Adhikari S. (Utkal U, Bhubaneswar, India) **A study of the expectancy bias and the suggestion bias of teachers.** *Indian Journal of Psychology*, 1973, Vol 48(4), 11-14.—Studied the effects of expectancy, suggestion, and control as shown by the results of an English test given to 20 students by 30 teachers. The teachers appeared to be more prone to expectancy bias than the students.—B. Roy.

2930. Dee, Joan McH. (Boston U, School of Education) **The relationships between the perceptions of selected elementary school teachers and their principals of the principals' leadership behavior and tendencies in intergroup dilemma resolution.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1521-1522.

2931. Ehrle, Elwood B. (Mankato State Coll) **Selection and evaluation of department chairmen.** *Educational Record*, 1975(Win), Vol 56(1), 29-38.—Presents guidelines for selection and periodic evaluation of department chairpersons. The selection involves 5 organizational steps and evaluation of 30 rated items, to which all interested parties may contribute.

2932. Emiley, Stephen F.; Grundle, Thomas J. & Zolik, Edwin S. (DePaul U) **Community system linkages through a school consultation program.** *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 196-202.—Analyzed the impact of a consultation program in a school system on the functioning and interrelationships of the component subsystem organizations. The efforts were directed both toward case-specific consultation at the school level, and programmatic organizational

consultation directed at change within the school subsystem and change in its relationships and involvements with the community system of caretaking organizations. Analysis by levels revealed specific changes at each level. The process of the development of system linkages was facilitated by the overlapping roles of the consultants.—*Journal summary.*

2933. Espirito, Tecla A. (Fordham U) **Teacher perception of professional leadership of public elementary school principals in Cebu: Its relationship to teacher morale, teacher performance, and pupil learning.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2205.

2934. Falbe, Ronald W. (Ohio U) **The efficacy of short-term empathy training which systematically integrates didactic, modeling, and experiential modalities of learning in teacher education.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2292-2293.

2935. Farrell, Marie P. (Boston U, School of Education) **The effects of comparative feedback and interpersonal evaluation on the teaching effectiveness of college professors.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1609.

2936. Fenster, Blossom L. & Cameron, Samuel M. (Northeast High School, Philadelphia, PA) **Meeting the needs of the high school psychology teacher.** *Behavioral & Social Science Teacher*, 1975(Spring), Vol 2(2), 30-33.—Needs discussed include better teacher training through the institution of a major in the teaching of psychology; increased professional recognition through certification procedures; and more support from universities, the American Psychological Association, and the federal government.

2937. Fincher, Cameron. (U Georgia, Inst of Higher Education) **Grand strategy and the failure of consensus.** *Educational Record*, 1975(Win), Vol 56(1), 10-20.—Analyzes 4 strategies institutions of higher learning are taking to define and solve their problems: (a) accountability, (b) alternative learning, (c) planned change, and (d) policy sciences. These strategies were necessitated by the loss of comity (civil, and humanitarian consensus) in the student protests of the 1960's. Each of the 4 has its own unique problems, but the major difficulties in all are rationale, talent, and technique. Policy sciences seem to be the most promising strategy at this time.—R. Gutzke.

2938. Fletcher, Matthew R. (Syracuse U) **A study of the feasibility of using the "Action Maze" game to identify the behavioral style of high school principals.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1019.

2939. Gleason, James F. (Arizona State U) **Relationships between role perceptions and expectations of graduate teaching assistants at Arizona State University.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1021.

2940. Greer, Bobby G. (Memphis State U) **Attitudes of special education personnel toward different types of deviant persons.** *Rehabilitation Literature*, 1975(Jun), Vol 36(6), 182-184.—A study of 99 special education teachers, using the Disability Opinion Survey and the Social Distance Survey, showed a more favorable attitude toward the physically and mentally disabled than toward alcoholics. On the other hand, perceived

attitudes tended to demand more of the disabled (i.e., to extend them less special consideration) than of alcoholics.—S. L. Warren.

2941. Haber, Franklin B. (Arizona State U) **The effect of instruction in questioning strategies on teaching assistants' classroom performance.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2458-2459.

2961. Nadler, Leonard. (George Washington U, School of Education) Recognition of noncollegiate learning experiences. *Training & Development Journal*, 1975(Jul), Vol 29(7), 8-11.—Reports that the American Council on Education plans to recognize training courses conducted by business, industry, private organizations, and government and to provide a basis for granting college credit. It is noted that this program has both long range implications and possible pitfalls for the field of human resource development. Course evaluation will require recorded measures of student achievement, possibly replacing emphasis on later job performance. Faculty may need to be more carefully selected, but use of fewer line personnel may lower the value of courses for the organization. Examining the quality of course materials may lead to reduced innovation. Similarly, while examination of subject matter may broaden perspective in a given program and increase transfer potential of courses, it may also tend to increase emphasis on traditional topics that are of less immediate

application. It is concluded that a visit by an evaluation committee will be most valuable if training people are candid and avoid the tendency to withhold data or play other games.—R. L. Sulzer.

2991. Williams, R. L. & Yousser, Z. I. (Eastern Michigan U, Physical Education Research Lab) **Division of labor in college football along racial lines.** *International Journal of Sport Psychology*, 1975, Vol 6(1), 3-13.—Responses by college football coaches to questionnaires and interviews provided data about (a) the percentage of Black players on each football team; (b) the demands of each position in terms of 12 mental, personality, and physical characteristics; and (c) the dominance of such characteristics in Black and White players. Study of 30 teams with over 1,000 players showed that (a) players' race was correlated with position assignments (i.e., Blacks were overrepresented in certain positions and underrepresented in others); (b) coaches judged some personal characteristics to be more important in some positions than in others; and (c) coaches rated Black players as different from White players on most of the above personal characteristics. Thus, coaches acted consistently in matching their racial stereotypes with their stereotyping of positions by assigning a disproportionately high percentage of Blacks to positions which presumably demand characteristics that coaches judged as relatively dominant in Black players. (16 ref) —Journal abstract.

3002. Barsky, Peter D. (Hatboro-Horsham High School, PA) Individual research projects in high school psychology. *Behavioral & Social Science Teacher*, 1975(Spr), Vol 2(2), 44-47. -Suggests 9 examples of individual research projects. Problems in undertaking them in a high school setting include time, space, subjects, money, and availability of research material.

3003. Borman, Karl G. & Hall, Keith A. (IBM, Manassas, VA) Using computer-assisted instruction to test the relative effectiveness of prompting and confirmation as instructional strategies. *Journal of Computer-Based Instruction*, 1974(Nov), Vol 1(2), 41-45. -Programmed 16 geometric figures for the IBM 1500 Instructional System and presented them to 43 paid undergraduates, using either a prompting or a confirmation sequence. The dependent variables were total number of

trials and total time required to meet the criterion of 2 consecutive errorless trials; number of items correctly identified at 1-, 7-, and 21-day intervals; and a student opinion score. Analysis indicated that the method of instruction had a significant effect on acquisition. Additional analyses indicated that Ss assigned to the prompting method required fewer trials to reach criterion. There was no significant effect of prompting or confirmation on retention. Opinion survey scores indicated that Ss assigned to the prompting procedure had a significantly more positive attitude toward computer-assisted instruction. —*Journal abstract*.

3022. Dusavitskil, A. K. & Repkin, V. V. (Kharkov State U, USSR) **[An investigation of the development of cognitive interests in young schoolchildren under different teaching conditions.]** (Russ) *Voprosy Psikhologii*, 1975(May/June), No 3, 92-102. - Reports an educational experiment carried out over a period of 10 yrs in an elementary school in Kharkov. Experimental groups were taught by a new method, based on theoretical considerations and calculated to modify the develop-

ment of cognitive interests by emphasizing the development of cognitive skills. Between the 2nd and 4th grades the cognitive interests of the experimental groups developed from narrow interests related to school subjects to general methods of cognitive functioning and theoretical generalizations and relationships. In the 4th grade such interests were incorporated in the motivational structure and dominated it. This contrasted with the control groups, where the main interest was narrowly pragmatic (grades, success) and only a few individuals developed broader cognitive interests by the time they reached the 4th grade. (English summary) (26 ref) - *L. Zusne*.

3023. Earle, Harold F. (U Maryland) **Student attitudes toward geometry.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1059-1060.

3036. Gentile, Lance M. (Pan American U) Effect of tutor sex on learning to read. *Reading Teacher*, 1975(May), Vol 28(8), 726-730.—60 Mexican-American boys from the 2nd, 3rd, and 4th grades of an Arizona school were tutored in reading for 1 hr twice a week for 8 wks. One boy from each grade was randomly assigned to each of 10 male and 10 female tutors (half of whom were Mexican-Americans and half Anglo-Americans) who were specially trained for the study. The group as a whole made a significant gain from the treatment, but improvement varied in the different grades, 4th-grade Ss tutored by males showing the most gain. Results are presented in detail and aspects needing further investigation are specified. (15 ref)—P. D. Leedy.

3039. Groff, Patrick. (San Diego State Coll) Long versus short words in beginning reading. *Reading World*, 1975(May), Vol 14(4), 277-289.—Suggests that monosyllabic words are easier for beginning readers to read than are polysyllabic words, and that children just learning to read should be taught phonics skills with monosyllabic rather than polysyllabic words. The basic rationale for monosyllabic words as the staple vocabulary for instruction in phonics for beginning readers has never been adequately investigated. Until enough empirical evidence is gathered to settle this problem, it seems wise to continue the use of monosyllabic words for the early stages of reading instruction. (59 ref)—C. K. Miller.

(Archbishop Ryan High School for Boys, Philadelphia, PA) Group processes in the teaching of high school psychology. *Behavioral & Social Science Teacher*, 1975(Spr), Vol 2(2), 41-44.—The use of group process techniques is distinguished from sensitivity training. 2 exercises are described, along with guidelines and cautions for their use.
3049. Jenkins, Martin D. & Ross, Bernard H. (American Council on Education, Office of Urban Affairs, Washington, DC) The urban involvement of higher education. *Journal of Higher Education*, 1975(Jul-Aug), Vol 46(4), 399-407.—Conducted a nationwide survey of the current status and future direction of urban affairs activities on college and university campuses. More than 99 percent of the 519 responding institutions indicated that urban involvement should be a major or minor function. The response also indicated that urban

involvement is likely to increase in the years ahead.—*E. L. Tatham.*

3050. Johnson, Dale D. & Pearson, P. David. (U Wisconsin, Madison) Skills management systems: A critique. *Reading Teacher*, 1975(May), Vol 28(8), 781-784. Critiques skills management systems (SMSs) on 6 counts: (a) their psycholinguistic naivete, (b) their assembly-line methods, (c) their concern for skill at the expense of interest, (d) their advocacy of sequencing separable reading skills, (e) the validity of their assessment instruments, and (f) the very notion of mastery itself. Alternatives to SMSs are suggested: a standardized reading test which would assess reading achievement in its widest sense, or some combination of informal oral and silent reading tests, or indices of attitudinal factors. Global measures like these have the virtue of requiring that the child read to demonstrate achievement.—*P. D. Leedy.*

3051. Klaff, Frances R. & Docherty, Edward M. (U Illinois, Urbana-Champaign) Children's self-concept and attitude toward school in open and traditional classrooms. *Journal of School Psychology*, 1975(Sum), Vol 13(2), 97-103.—Compared children from a traditional school and 2 open schools using the Pictorial Self-Concept scale and the Attitude Toward School scale. Ss totaled 185 kindergartners and 1st and 2nd graders. To control for the self-selection of open school Ss, traditional school Ss were divided into those whose parents favored and those whose parents did not favor open education. 3 of the 12 analyses were significant, but not in the predicted, or in any orderly, direction. Results are attributed to chance. Attitude toward school was higher in females than males and decreased from kindergarten to Grade 2. Self-concept increased from kindergarten to Grade 2, with no significant sex differences.—*Journal abstract.*

3052. Kleederman, Frances F. (Kean Coll) Black English and reading problems: Sociolinguistic considerations. *Reading World*, 1975(May), Vol 14(4), 256-267.—Sociolinguists have proposed various beginning reading approaches to remedy the reading problems of disadvantaged Black children. Their programs reflect their biases concerning the nature of Black English and the type and degree of interference that may exist between the language of the text and the child's dialect. It is noted that teaching factors cannot be separated from their cultural and political implications. Thus the values and attitudes about language and literacy are complexly interwoven with major institutions of our society. (22 ref)—*Journal summary.*

3059. Marks, Joan I. (Stanford U) The use of task analytic procedures to develop individualized, self-instructional vocabulary learning materials. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1135.

3060. Mazurkiewicz, Albert J. (Kean Coll) Comparative attitudes and achievements of the 1963 i.t.a. and T. O. taught students in the tenth and eleventh grades. *Reading World*, 1975(May), Vol 14(4), 242-251.—First-grade students who had been taught to read by the initial teaching alphabet (ITA) method demonstrated no negative achievement characteristics in reading, language arts, or spelling when compared, in the 10th grade, with their traditional orthography (TO) counterparts on standardized tests of achievement. The ITA-taught group showed a continuation of better spelling skills, first reported in the 3rd grade, and this better achievement in the 10th grade was almost statistically significant.—*C. K. Miller.*

3061. McKenzie, Leon. (Indiana U) Analysis of Bildungsroman literature as a research modality in adult education: An inquiry. *Adult Education*, 1975(Sum), Vol 25(4), 209-216.—Discusses whether Bildungsroman literature (i.e., literary portraits of the development of a central character in fiction such as Joyce's *Portrait of the Artist as a Young Man*) is a reliable research modality for the field of adult education. General, educational, and literary delineations of the research process are presented, and ways in which this literary genre can be used as a model of human development and behavior are examined. (19 ref)

3062. Meredith, Mitzi. (Elk Grove High School (CA)) Developing a personal theory of child development in high school. *Behavioral & Social Science Teacher*, 1975(Spr), Vol 2(2), 50-53.—Describes techniques used in high school courses designed to help students prepare for the future. A game in which students develop comprehensive statements of the basic concepts of key psychologists is described. Child abuse is covered using lectures and films provided by a local police officer. Having parents with infants attend the class, writing about one's personal philosophy, and tutoring elementary school children are also suggested.—*R. Tomasko.*

3063. Mikhailov, I. V. (Scientific Research Inst of General & Pedagogical Psychology, Moscow, USSR) [The role of psychological education in stimulating self-evaluation.] (Russ) *Voprosy Psichologii*, 1975(May-Jun)

No 3, 131-133.—Conducted a 2-yr educational experiment in the last 2 grades of high school. Experimental classes were offered an elective course in introductory psychology that stressed personality, temperament, interests, and abilities. An analysis of essays, questionnaires, and occupational choice at the end of 2 yrs showed a far greater tendency for pupils in the experimental groups to engage in self-evaluation and self-analysis, and to see the relationship between personality characteristics, abilities, temperament, and the requirements of specific occupations.—L. Zusne.

3065. Milner, Stuart & Wildberger, A. M. (Catholic U of America, Ctr of Educational Technology) **How should computers be used in learning?** *Journal of Computer-Based Instruction*, 1974(Aug), Vol 1(1), 7-12.—Discusses computer applications (a) in instruction for which there is essentially no other competition method for accomplishing the same results, (b) in situations which require nontrivial instructional capabilities, and (c) in instances where the computer is the most economical way to perform instruction. The levels of computer capabilities and educational benefits derived are discussed. (18 ref)

3066. Morrow, Elmer C. (Pennsylvania State U) **The effect of taped listening lessons on the achievement of first grade readers.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 1136-1137.

3067. Newcomb, Lawrence H. (Ohio State U) **The effect of contract grading on student performance.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2175-2176.

3068. Nickel, Horst & Fenner, Hans-Jörg. (U Düsseldorf, W Germany) **[Direct and indirect guidance in presenting instructional lessons.]** (Germ) *Zeitschrift für Entwicklungspsychologie und Pädagogische Psychologie*, 1974, Vol 6(3), 178-191.—Examined 4 characteristics of direct-indirect guidance in an area of instruction (questions, orders, addresses, and impulses to think) through 90 lessons taught by 30 4th grade teachers. Data included various methods of instruction as well as teachers' age and sex. Findings reveal that frequency of single instructional characteristics as well as their stability within a lesson varied significantly by subject and way of instruction but not significantly with teachers' age and sex. Different reliabilities were observed with the 4 guidance variables. Results also reveal no significant intercorrelation of the (guidance) characteristics. This is interpreted as evidence that revisions are required with respect to the view that instructors hold relatively stable characteristics of personality within the instructional role, and that a more differentiated theory concerning instructional processes may be feasible. (20 ref)—R. Scott.

3069. Norton, Fay-Tyler M.; Mandryk, Thomas R. & Nodacker, Milton W. (Ohio State U, Mershon Ctr) **The internship experience at a large urban community college.** *Behavioral & Social Science Teacher*, 1975(Spring), Vol 2(2), 54-60. Describes a program in which the behavioral science graduate student, with appropriate training and supervision, performs the professional tasks

involved in teaching. The role of the professional assistant in the intern program is described, together with the development of an internship training manual using behavioral objectives. The 2-yr college is considered an excellent site for a graduate teaching internship program because of its variety of students and focus on teaching rather than research. The importance of graduate faculties counseling their students in ways to learn how to teach is emphasized.—R. Tomasko.

3083. Skellfjord, Vebjørn. (U Oslo, Inst of Educational Research, Norway) **[Some linguistic points of view on central aspects of the reading process and the teaching of reading: An empirical study and possible implications.]** (Norg) *Skolepsykologi*, 1975, Vol 12(3-4), 218-227.—Discusses the necessity of oral reconstruction in the reading process. A study in 2 kindergarten classes in Oslo indicate that as a rule, these 6-yr-olds were not able to spontaneously analyze words in units of phonemic size (only 37% succeeded, and 15% of the responses were of syllable size). Ss were trained for 22 wks daily every 2nd week with words of 3 units, stressing equally acoustic and articulatory features. In the intervening weeks, Ss were tested with separate series according to the requested position of the phoneme. After 1 wk, 63% responded with relevant units. The 1st was easiest and the 2nd the most difficult. When asked to locate all phonemes in succession, Ss still tended to make reversals. They often articulated silently. When asked to combine series of phonemes after 6 and 11 wks of training, the correlations of analysis and synthesis were 0.85 and 0.93. Reading reversals may be explained to a certain extent by difficulties with perception of the articulatory succession of segments. Stress segmentation and succession in the teaching of reading is recommended. (20 ref) —*Journal abstract*.

[Skill in oral reading of children with low and normal birth weights who grew up in different milieus.] (Danish) *Skolepsykologi*, 1975, Vol 12(3-4), 186-214.—Compared the pace and frequency of misreadings of 105 2nd graders with that of 431 5th graders. Grade 2 Ss weighed 2,500 gm or below at birth; Ss in Grade 5 were divided into 3 groups according to birth weight (below 1,500 gm, 1,501-2,000 gm, and 2,001-2,500 gm) and 5 socioeconomic levels. Results support the conclusion that reading rate was not (or only to a small degree) influenced by birth weight. Results also indicate that Ss' background, in a broad sense, determined the quality and rate of reading.—*Journal abstract*.

(U Manchester, Inst of Science & Technology, England) **The impact of marathon encounters on teacher-student relationships.** *Interpersonal Development*, 1974-1975, Vol 5(2), 71-77.—Hypothesized that an intensive encounter group experience between teacher and students can improve their relationship. G. T. Barrett-Lennard's Relationship Inventory, which measures the degree of level of regard, empathy, unconditionality, and congruence in relationships, was given to 2 classes of university students at the beginning and end of their academic term. One class ($n = 36$) participated with their faculty member in a 24-hr marathon encounter group near the beginning of the course, whereas the other ($n = 24$) did not (although they were provided with additional group seminars to control for absolute contact time). Students attending the encounter group with their teacher showed significant increases in their perceptions of their teacher on his level of regard and congruence and a movement in the direction of significance on his empathy. In contrast, no change was observed on any of the Relationship Inventory scales for the control students. (15 ref) —*Journal abstract.*

3146. Crittenden, Kathleen S.; Norr, James L. & LeBailly, Robert K. (U Illinois, Chicago Circle) **Size of university classes and student evaluations of teaching.** *Journal of Higher Education*, 1975(Jul-Aug), Vol 46(4), 461-470. For 981 undergraduate classes at the University of Illinois at Chicago Circle, mean student ratings of instruction decreased with increasing class size. 10 other

variables (including percentage of majors, mean expected grade, mean GPA, and rank of instructor) were analyzed to examine their effects. When these variables were held constant, this negative relationship remained strong. There were 5 evaluation dimensions (interpersonal, professional, motivation, structure, evaluation) and an overall rating of student learning. The relationship between size and rating was basically monotonic for all 6 measures. Students' t tests were used for directional orthogonal comparisons between 4 size categories (5-25, 26-50, 51-100, and 101-600 students). It is suggested that ratings be normed separately for different size classes so that unfair comparisons are avoided. Large classes may also need increased allocation of resources and personnel rearrangement to match teaching skills with teaching assignments. (17 ref)—E. L. Tatham.

3149. Ellery, M. D.; Blampied, N. M. & Black, W. A. (U Canterbury, Christchurch, New Zealand) **Reduction of disruptive behaviour in the classroom: Group and individual reinforcement contingencies compared.** *New Zealand Journal of Educational Studies*, 1975(May), Vol 10(1), 59-65.—Studied 7 emotionally disturbed and/or socially maladjusted children. 5 disruptive behaviors were investigated: (a) talking without permission, (b) talking or whispering to neighbor, (c) more than 1 person at a time questioning teacher, (d) calling out to the teacher, and (e) making unnecessary noise. A reversal design (ABACA) with a replication was used (A = baseline, B = individual contingency, C = group contingency). Results indicate that disruptive behavior in the classroom can be suppressed by reinforcement contingent on its nonoccurrence, since the observed frequency of disruptive behavior in this study was a function of the presence or absence of the reinforcement contingencies. It was also shown that the group contingent reinforcement condition was at least as effective as the individual contingencies in suppressing the disruptive behavior. Since both group and individual contingencies produced essentially zero frequency of disruptive behavior, neither is judged superior to the other. Results are interpreted as supporting the use of group contingent reinforcement as a practical technique for the control of disruptive classroom behavior. Some of the disadvantages of this method are outlined. (21 ref) —M. E. Pounsel.

3176. **Perkins, David S.** (Swarthmore Coll) **Aspects of student discontent: 1975.** *Journal of Higher Education*, 1975(Jul-Aug), Vol 46(4), 471-477.—Discusses 3 major areas of student discontent (curricular irrelevance, demand for increased student participation in decision making, and student apathy) in the 4-yr liberal arts college. It is suggested that if professors were to revive the debate over general educational goals, involving students in that debate, the curriculum would take on a meaning adaptable to the needs of society and of the individual. Taken to an extreme, this would require the professor to justify every new datum along some vague utilitarian line (the position of many students in the 60s). A middle course, however, might transform the destructive conflict between the necessary discreteness of the curriculum's parts and their necessary cooperation towards a whole into a constructive tension.—*E. 3178. **Purdue U, Measurement & Research Ctr.** **Freedom to read issues.** *Purdue Opinion Panel Poll Report*, 1974(Aug), No 100, 24 p.—Studied attitudes of secondary students to censorship of reading materials. Respondents were a stratified nation-wide sample of 973 students in public and private schools in Grades 10-12; nonresponse was high among schools in the rural South. Attitudes were related to demographic characteristics, students' perceived educational objectives, liking for their English course, and skills in the English language. Most students expressed attitudes rejecting censorship, though there was a small hard core of pro-censorship respondents. The latter tended to score low on vocabulary tests, to make more use of radio and television, and to be the children of poorly educated parents. Subsidiary findings showed relationships between vocabulary achievement, English grades, liking for English, and out-of-school activity related to English; females were more involved with English than males, although no sex differences were found in attitudes to censorship. Comparison with results of a similar survey in 1961 showed the amount of time spent in out-of-class English study had marginally decreased. It is inferred from the overall results that the classroom teaching of English has

implications not only for cognitive development, but also for the development of values. (20 ref)—*C. K. Knapper.*

Counseling & Measurement

3225. Adams, E. N. (IBM, Thomas J. Watson Research Ctr, Yorktown Heights, NY) **On scoring a mastery learning system control test.** *Journal of Computer-Based Instruction*, 1974(Nov), Vol 1(2), 50-58.—Describes the dichotomous outcomes model in which a student's state of learning is modeled to agree with the outcomes Mastery and Nonmastery made on a control test. The quality of the test item is characterized by 2 error parameters equal to the probabilities of errors of testing, and a scoring algorithm is specified based on the probabilistic theory of interference. A bootstrap system for determining error parameters is described and is shown to converge to true values of the parameters in a system for which the underlying model is valid. The possible application of the ideas to control test scoring is discussed.—*Journal abstract*.

3226. Aldridge, Ernest E. & Ivey, Allen E. (Westfield Clinic Child Guidance, MA) **The microcounseling paradigm in the instruction of junior high school students in attending behavior.** *Canadian Counsellor*, 1975(Apr), Vol 9(2), 138-144.—Tested the validity of the microcounseling paradigm in teaching a basic counseling and interpersonal skill, attending behavior, to 9th graders. The experimental design involved training of 8 Ss in attending skills and comparing their interviewing effectiveness with 8 untrained Ss. Training involved video models, self-observation, cue discrimination, and reinforcement of desired behavior. The experimental group demonstrated significantly increased verbal and nonverbal attending behaviors on 7 of 13 comparisons. Implications of microcounseling for the teaching of communication skills to clients are discussed. (French summary)—*Journal abstract*.

3227. Amigues, R. et al. (U Provence, Groupe de Recherche en Docimologie, Aix-en-Provence, France) **[Evaluation of pupils' production: Search for explanatory model.]** (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 793-799.—Proposes a systematic model for evaluating pupils' production. The model is accompanied by a discussion of some of the problems involved in evaluating behavior in a natural environment, determinants of the behavior of the evaluator, and anchor effects of evaluative judgments.—Z. M. Cantwell.

3228. Bahros, Anthony N. (Boston U, School of Education) **A study to determine the effect of intensive small group interaction on the attitudes of high school students.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1685.

3229. Benson, Arland N. & Blocher, Donald H. (Roseville Schools, MN) **The change process applied to career development programs.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 656-661.—Conducted a needs assessment to assist in the development of a K-12 career education program. As a first step following analysis of the results, a K-6 pilot project was funded on a 3-yr basis; this project is described. Evaluation data at

the end of the 2nd yr lacked evidence to support positive changes in students' outcomes at the elementary level. As a consequence, it was decided to use a more specific focused approach at the junior and senior high levels. —G. S. Spurr.

3232. Cain, William H. (U North Carolina, Greensboro) A comparison of reinforcement and model-reinforcement techniques in influencing verbal participation. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2287.

3233. Checkley, S. M. (Northern Alberta Inst of Technology, Edmonton, Canada) A professional decentralized approach to counselling: An experiment in counselor visibility. *Canadian Counsellor*, 1975(Apr), Vol 9(2), 112-116.—Describes a decentralized approach to counseling that was initiated at the Northern Alberta Institute of Technology following an examination of the effectiveness of the previous centralized approach. A counselor was located in the mainstream of student and staff movement. It was expected that this relocation would reduce instructor-counselor barriers to counseling by placing counseling in an "educational model" where the counselor was located and integrated into the scene of action, as contrasted to the usual "medical model" where the student-staff must seek out the counselor at some distant point. (French summary)—*Journal abstract*.

3241. Crookshanks, J. Doug & Herman, Al. (Brandon Mental Health Ctr, Canada) Predictors of success and status of college students. *Canadian Counsellor*, 1975(Apr), Vol 9(2), 117-125.—Assessed the ability of entrance tests as well as selected background variables to predict GPA for 882 1st-term full-time freshmen enrolled in an Alberta college. The entrance tests included the Wonderlick Personnel Test, the Van Wagenen Rate of Comprehension Scale, and the Costello-Comrey Need Achievement Scales. Background variables included age, sex, and last completed grade of each S. None of the entrance tests were able to differentiate between dropouts and nondropouts. The mental ability test was a significant predictor within certain academic programs. (French summary) (26 ref)—*Journal abstract*.

3242. DeFleur, Lois B. & Menke, Ben A. (Washington State U) Learning about the labor force: Occupational knowledge among high school males. *Sociology of Education*, 1975(Sum), Vol 48(3), 324-345.

3243. Dupont, Jean-Blaise. (U Lausanne, Inst de Psychologie Appliquée, Switzerland) [The objectives of vocational and school guidance (in particular in dual situations).] (Fren) *Orientation Scolaire et Professionnelle*, 1975(Jan-Mar), Vol 4(1), 7-19.—Formulation of objectives by collective sources (professional societies, international organizations, legislators) and by prominent individuals stress self-actualization of the whole person and its integration into society. The role of the guidance counselor is to make information available to the client regarding job requirements and job market conditions and provide active assistance in solving personal and professional problems associated with making a choice or change. The type of intervention depends on the occasion and the client but in general will contain elements of psychometric testing as well as clinical analysis.—M. G. Strobel.

3244. Dyer, Calvin O.; Neigler, Cynthia & Milholland, John E. (U Michigan, Combined Program in Education and Psychology) Rater agreements in assigning Stanford-Binet items to Guilford's Structure of Intellect operations category. *Journal of School Psychology*, 1975(Sum), Vol 13(2), 114-118.—19 school psychologists

assigned the 142 items in the Form L-M of the Stanford-Binet Intelligence Scale to the 5 operations categories of Guilford's structure of intellect model, following flow charts prepared for this purpose by M. Meeker (see PA, Vol 39:15303). On the average, one rater agreed with another on about half the items, and their model assignments agreed with Meeker's assignments on only 81 (57%) of the items. These levels of agreement are judged not to be high enough to justify classifying Stanford-Binet items in accordance with the structure of intellect operations of Intellect Operations categories.—*Journal abstract.*

3245. Fairchild, Thomas N. (U Idaho, Guidance & Counseling) **Accountability: Practical suggestions for school psychologists.** *Journal of School Psychology*, 1975(Sum), Vol 13(2), 149-159.—Describes 6 techniques of accountability, noting that increased emphasis on accountability in education has led to an increased emphasis on accountability for the school psychologist. Traditionally, school psychologists have been associated with diagnostic testing and special education programs. It is posited that criticism of psychological tests and special class placement is placing school psychologists in a precarious position. Because psychologists will be called upon to justify their presence in the schools, it is imperative that they provide substantive proof regarding the efficacy of their performance.—*Journal abstract.*

3246. Gill, Kenneth F. (Northern Illinois U) **An investigation of congruent and incongruent value systems between college students and teachers as it affects student evaluation.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2162-2163.

3250. Groff, Patrick. (California State U, San Diego) **Reading ability and auditory discrimination: Are they related?** *Reading Teacher*, 1975(May), Vol 28(8), 742-747.—Challenges the emphatic acceptance by some writers of the thesis that auditory discrimination is causally related to reading success. J. M. Wepman's Auditory Discrimination Test (ADT) is critically discussed, particularly his procedures for classifying a child as "adequate" or "inadequate" in auditory discrimination, doubtful procedures leading in turn to biased statistical results. Research studies which cast further doubt on the validity of the ADT are cited. It is noted that provocative statements made by F. Smith (1971, 1973), although not proved, call for serious study. There is enough negative evidence to warrant a cautious attitude toward the supposed relationship between auditory discrimination and reading ability. (21 ref)—*P. D. Leedy.*

3253. Hansen, Lorraine S. & Tennyson, W. Wesley. (U Minnesota) **A career management model for counselor involvement.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 638-645.—Presents a perspective of the present status of society in relation to career guidance, development, and education. A career development program from kindergarten through post-high school, which can be adapted to adult life, is described. It is suggested that in order to shape and influence career education programs through career guidance, counselors need a framework for intervention consistent with their traditional concern for human development. An example of such a model is presented.—*G. S. Speer.*

3254. Hersvall, Marie; Lindell, Ebbe & Petterson, Inga-Lill. [On quality in the written language of upper secondary school students.] (Swed) *Pedagogisk-Psychologiska Problem*, 1974(Nov), No 253, 67 p. Compositions written by 12th graders were rated by teachers as to overall quality, and these general ratings were compared with a number of more objective and detailed linguistic indicators. Among the detail indicators that correlated highly with general ratings were general productivity (number of words) and word knowledge (different words). Possible educational implications of these and other findings are discussed. (24 ref) *English abstract.*

3255. Hillman, Bill W.; Penczar, John T. & Barr, Reginald. (U Arizona, Coll of Education) **Activity group guidance: A developmental approach.** *Personnel & Guidance Journal*, 1975(Jun), Vol 53(10), 761-767.—Activity Group Guidance (AGG) is discussed as a useful tool for counselors who wish to include developmental guidance in their repertoire. The content, process, and group dynamics of AGG are illustrated, and a comprehensive AGG program is described and evaluated. Specific suggestions to counselors who wish to start activity groups are given. (15 ref)—*Journal abstract.*

3259. Hymmen, Phyllis. (Donview Heights Junior High, Don Mills, Canada) **Group-guidance classes: An anachronism?** *Canadian Counsellor*, 1975(Apr), Vol 9(2),

98.101. Reviews the literature to indicate that the concept of guidance classes is not an anachronism. Definitions and research conclusions are not noted, and the failure of many guidance classes is attributed to a mismatch of content and process. The use of alternate approaches to guidance, such as individual and group counseling, is discussed. (French summary) (16 ref)—*R. Tomasko*

3260. Jackson, Robert M.; Cleveland, John C. & Merenda, Peter F. (U Wisconsin, Educational Service & Research Institute) The longitudinal effects of early identification and counseling of underachievers. *Journal of School Psychology*, 1975(Sum), Vol 13(2), 119-128.—Examined the effects of early identification and psychological services on underachievement through a follow-up study conducted 6 yrs later. 117 Grade 4 underachievers had been identified through a regression equation and were divided into experimental and control groups. Experimental Ss received psychological services during their 4th, 5th, and 6th grades from a team of university professors. Psychological services were primarily adult centered, focusing on the redirection of parents and teachers who were the primary influence on the lives of these underachievers. Follow-up studies of them at high school graduation indicated that differences between these groups reached at least the 0.05 level of significance for class rank, the American College Testing Program composite, the Iowa Tests of Educational Development composite and its subtests, and level of educational and vocational performance after high school graduation.—*Journal abstract.*

3261. Kaufman, Jean-Pierre. [Observation of pupils by their teachers: An attempt to construct trait scales to evaluate school behavior of junior high students.] (Fren) *Orientation Scolaire et Professionnelle*, 1975(Jan-Mar), Vol 4(1), 51-76.—Describes an evaluation scheme which standardizes the normative assessment of students by their teachers. Based on semantic descriptions, a scale was developed measuring 60 traits. Factor analysis revealed 22 traits loading high on intelligence, motivation, and academic interest; 38 traits loaded on personality factors and characteristics appreciated in the school environment. In a first application, there were no differences between students in grades 3-6, and this finding is interpreted as evidence that the teachers judged students not on an absolute scale but against a standard appropriate for the student's level.—*M. G. Strobel.*

(Mesa Public Schools, AZ) **Field testing a comprehensive career guidance program, K-12.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 663-667. -Describes the development of a career education program in a school district of 28,000. Following a detailed needs assessment, curriculum development, evaluation strategies, and other steps, a comprehensive career guidance program was developed by counselor/teacher teams. 24 units, K-12, were completed, representing 250 hrs of instructional materials. -*G. S. Speer*.

3278. McNamara, J. Regis. (Ohio U) **Ways by which outcome measures influence outcomes in classroom behavior modification research.** *Journal of School Psychology*, 1975(Sum), Vol 13(2), 104-113. -Identifies 3 ways by which outcome measures influence outcomes in classroom behavior modification studies. Inadequacies in selecting a dependent variable are attributed to the lack of fit between the conceptual category system used by the behavior modifier and that used by the referral agent in the classroom. Recommendations for modifying the selection process are made which include the use of reciprocal target behavior, the incorporation of special control Ss for whom the response is not problematical, and the simultaneous assessment of attitude and beha-

vior change responses. Reliability characteristics of the dependent variable are examined from the point of view of demand characteristics operating within the recording situation and statistical efforts peculiar to the analysis of recorded data. The utility of outcome measures are examined from the point of view of their impact on influencing others in the applied research environment. (43 ref) -*Journal abstract*.

3282. Mordant, Gilberte. [Guidance and counseling at the university: Reflections on the situation in the United States.] (Fren) *Revue Belge de Psychologie et de Pédagogie*, 1974(Sep), Vol 36(147), 41-62. Reports the observations of a Belgian university professor during visits to 8 American universities, including descriptions of guidance services, personnel, programs, etc. Fundamental differences exist between the total university community in the 2 countries and of differences in the philosophy of guidance and counseling services. In the US there is more choice, and more diverse curricula, with guidance and counseling available throughout the student's career. Likewise unique is the American concept of an education which fosters development of the entire personality and the achievement of self-realization. It is asserted that drastic changes will be necessary before such goals can become possible in Belgium. At present Belgian officials in higher education are merely considering changes, while the students themselves are demanding them. -*I. A. Ostlund*.

3283. Newcomer, Phyllis L. & Hammill, Donald D. (U Texas, Austin) **ITPA and academic achievement: A survey.** *Reading Teacher*, 1975(May), Vol 28(8), 731-741. -Reviews and analyzes the results of 50 studies which investigated the predictive and diagnostic validity of the Illinois Test of Psycholinguistic Abilities (ITPA). The primary assumption underlying the ITPA is that it can be used to identify deficits related to academic failure. The research literature fails to validate this assumption. Even using a less than stringent criterion, 9 of the 12 subtests have no relation to any area of academic achievement. Findings are presented in detail and their important implications for school practice are discussed. It is concluded that the ITPA's value is limited to gathering broad descriptive information about children's learning characteristics; its use for individual diagnosis is not supported or recommended. 3305. Tscherner, Klaus & Masendorf, Friedrich. (Private Practice, Kettering, OH) **[Analysis of personality ratings and grading of different teachers.]** (German)

Psychologie in Erziehung und Unterricht, 1974, Vol 21(3), 135-149.—Using 25 pairs of bipolar traits, 36 teachers in 4 larger northern Germany cities rated the personalities of their 810 students in Grades 7-10. The schools were of 3 levels, and included 15 classes with retarded students. 5 factors were extracted in a factor analysis with varimax rotation: self-control, ambition, intelligence, conformity, and toughness. 3 major groups in each class were detected by using cluster analysis. For some teachers 2 factors were sufficient to separate the groups; others used all 5. The degree of influence of the 5 dimensions on grades varied strongly from teacher to teacher. The multiple correlations between ratings and grades for different classes and subject areas ranged between 0.38 and 0.99, and were mostly significant to very significant. On the average, correlations were higher for boys than for girls. (English summary) (16 ref)—W. O. Horn.

3306. Tuck, B. F.; Hanson, A. L. & Zimmerman, M. (U Canterbury, Christchurch, New Zealand) **The WISC-R: A Zealand study of norms and validity.** *New Zealand Journal of Educational Studies*, 1975(May), Vol 10(1), 52-58.—Tested the validity of the WISC-R for a stratified sample of 60 urban and 40 rural New Zealand 11-12 yr olds. Ss were stratified according to Otis Intermediate deviation IQs, sex, geographical location, age, and fathers's occupation, and were administered a modified version of the WISC-R. Results indicate that the WISC-R Full Scale has a high degree of concurrent validity with the Otis and the Progressive Achievement Tests. As expected, there were higher correlations between the WISC-R Verbal scale and the standardized tests than there were between the Performance scale and the standardized tests. Rotated factor analysis indicated that there were positive correlations between all of the tests in the domain; unrotated factor analysis emphasized that the correlations within the verbal and performance clusters were higher than the correlations between clusters. Females had a higher WISC-R Full Scale mean than the males, and urban Ss had a higher WISC-R Full Scale mean than rural Ss. It is suggested that further studies be conducted with children varying in age and ethnic background before the test is widely used in New Zealand. M. E. Pounsel.

APPLIED PSYCHOLOGY

3316. Gavrilov, V. E. (All-Union Research Inst of Vocational-Technical Training, Leningrad, USSR) **[An attempt at a taxonomic analysis of the cognitive professions.]** (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 84-91.—Used taxonomic analysis to construct a psychological classification of 76 cognitive occupations (those having to do with examination, diagnosis, identification, or research). Each occupation was first described in terms of 49 characteristics pertaining to its subject matter, object, work conditions, work tools, and the main modality of the information processed. The 76 occupations fell into 15 categories designated as sorters, checkers, laboratory workers, guardians, correctors, merchandise experts, controllers, experts, inspectors, auditors, art experts, researchers, natural scientists, humanists, and symbol experts. (English summary)—L. Zusne.

3317. Herbert, Anders. (U Stockholm, Inst of Applied Psychology, Sweden) **Measurement of perceived work difficulty.** *Reports from the Institute of Applied Psychology, U Stockholm*, 1974, No 52, 11 p.—Performed a study with a total of 93 psychologists, telephone maintenance men, and insurance claims adjusters to determine (a) whether individuals rate the difficulty of their work tasks in a consistent way, (b) the agreement among individuals rating the difficulty of the same tasks, and (c) whether results obtained by different rating methods differ from each other. Ss rated the average difficulty of tasks

belonging to their job. The rating methods were pair comparisons, and graphic, category, and numerical scales. The ratings were examined with regard to intra- and interrater reliability, and the rating scales compared with regard to the distribution of rating scores and the capacity for discrimination. The median rank correlation between an individual's repeated ratings ranged between 0.70 and 0.90. Interrater reliability was about 0.60. The rank order of difficulty among tasks was almost the same, irrespective of rating method used, but the total distribution of ratings differed conspicuously. In a group where preference for different tasks and uncertainty about outcome were measured, results indicate that the more difficult tasks were preferred, and that a fairly strong relationship existed between uncertainty about outcome and perceived difficulty.—*Journal abstract.*

3318. Hoc, Jean-Michel. (Lab de Psychologie du Travail de l'E.P.H.E., Paris, France) [Remarks on the analysis of job functions and on the training of the systems programmer.] (Fren) *Bulletin de Psychologie*, 1974-1975, Vol 28(16-17), 857-859.—Discusses systems analysis and the systems programmer for the purpose of arriving at a method of observing and studying programmer behavior.—Z. M. Cantwell.

3319. Singer, Robert N. (Florida State U, Division of Human Performance) **Sports psychology.** *American Corrective Therapy Journal*, 1975(Jul-Aug), Vol 29(4), 115-120.—Sports psychology is described as the science of psychology applied to athletes and athletic situations. While experts from various allied health fields have been associated with athletes, only recently have psychologists in the US begun to show an interest. 6 areas are indicated where psychology may make a valuable contribution: (a) the identification of athletes with ideal psychological attributes that will be useful to the team; (b) the understanding and treatment of younger athletes; (c) helping athletes to progress as quickly as possible from performance potential to performance realization; (d) the motivation of athletes before and during the season and specific events; (e) the development of team morale, effective competition and cooperation, and understanding of group dynamics and leadership; (f) understanding the psychological problems of individual athletes.—D. R. Marino.

3320. Vinson, Earl. (U Washington, Seattle) **An empirical investigation of differences in job motivation, performance, and satisfaction between Black and White employees.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2106-2107.

Occupational Attitudes & Interests & Guidance

3321. Becker, Marshall H. & Katatsky, Marilyn E. **Persons denied admission to medical schools: A case of blocked career choice.** *Social Science & Medicine*, 1975(Jun), Vol 9(6), 333-338.—Followed the career paths of a cross-national sample of 9,123 students who were refused admission to the 1966-1967 entering class in US medical schools. The sample of rejectees was stratified by geographic region and by sex. Data were gathered using a mailed questionnaire which covered the respondent's personal and academic background, sources of influence in career choice, perceptions of the rejection, and variables affecting ultimate career choices

Hypotheses were developed relating academic ability and performance, professorial encouragement, expectancy of acceptance, and perceived reasons for rejection to likelihood of persistence in reapplication and subsequent career decisions. 52% of the sample entered fields unrelated to health and medical care, and almost half did not even consider a different health career upon rejection. While females had relatively better grades and test scores, they tended to view their rejection as "fair" and were less likely than males to reapply, to hold positive self-perceptions, and to choose careers with higher educational requirements and prestige. Male persisters (12 of whom ultimately became physicians) were those who reported difficulty with the hard sciences, achieved lower grades, received less encouragement from instructors to continue study, expected acceptance, and attributed rejection to factors outside themselves.—*Journal abstract.*

3322. Brolin, Donn E. (U Missouri, Undergraduate Program in Rehabilitation Services Education, Columbia) **Agency settings for career guidance.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 686-690.—Reviews some of the current career guidance agencies and services (including manpower, rehabilitation, and social service agencies). Recommendations are made for needed changes, and suggestions offered for a more competency-based orientation by agency personnel. It is concluded that career guidance agencies can make a significant contribution by identifying special needs and assisting clients in moving toward occupations that will meet those needs. Many individuals need to build self-confidence so that they believe they can be successful.—M. E. Pounsel.

3323. Feldman, Howard S. (Boston U, School of Education) **The effects of a career planning experience on the vocational maturity, self concept and vocational choice among inmates of penal institutions.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1610-1611.

3324. Geurin, Virginia S. (U Arkansas) **Educational and occupational achievements of rural youth in relation to educational and occupational aspirations: A follow-up study.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2293-2294.

3325. Gysbers, Norman C. & Moore, Earl J. (U Missouri, Coll of Education, Columbia) **Beyond career development—life career development.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 647-652.—Argues that present theories of career development are more appropriate than traditional theories, but most current theories still separate work roles, settings, and events from other roles, settings, and events in the life of the individual. It is proposed that the meaning of career should be expanded to encompass the individual's total life.—G. S. Speer.

3326. Harwood, Richard K. (U Virginia) **A comparison of the effects of counseling and a self help booklet on placement readiness.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1614-1615.

3327. Hood, V. G. (Tavistock Clinic, London, England) **The use of symbolic meanings in career counselling.** *British Journal of Psychology*, 1975, 66(1), 1-10.—Discusses

ses the extent to which the interpretation of test materials in vocational guidance and career counseling should rely on universal symbolic meanings in contrast to the individual client's own private symbols. A review of studies which examined the relationship between Freudian symbols and culturally determined ones provided evidence for 3 hypotheses: (a) cultural and experiential factors are more important than Freudian sexual identification by shape and function in establishing the sexual significance of symbols; (b) many more symbols are associated with masculinity than with femininity; and (c) no symbols are universally masculine or feminine. Material from current consultations is used to illustrate difficulties in interpreting symbolic content in test responses.—J. Adams-Webber.

3328. Littig, Lawrence W. (Howard U) **Personality, race, and social class determinants of occupational goals.** *International Mental Health Research Newsletter*, 1975(Sum), Vol 17(2), 2-6, 13-16.—Reviews the author's research on occupational goal determinants for Black and White American and English youth of college age. Examining effects of needs for achievement, affiliation, and power on aspirations to enter traditionally closed occupations (upward mobility), the investigations revealed the following: (a) For women, no identifiable relationship appeared between occupational aspirations and the motivational variables, race, and social class. (b) For working-class Black men, achievement needs were linked to aspiration to closed occupations. (c) For middle-class men overall, affiliation needs were related to closed-occupation aspiration. Since the American occupational structure is moving toward sponsored mobility, which favors affiliation motivation, the future is uncertain for achievement-oriented working-class people. (35 ref)—C. A. Heikkinen.

3329. Mahan, Linda C. (U Alabama) **Work experience as a correlate of the vocational maturity of college freshmen.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2305-2306.

3330. Manaster, Guy J. & Perryman, Thomas P. (U Texas, Austin) **Early recollections and occupational choice.** *Journal of Individual Psychology*, 1974(Nov), Vol 30(2), 232-237.—Studied the ability of the manifest content of early recollections to differentiate between persons choosing different occupations. Written early recollections were obtained from 81 university students. Results indicate that the number of nursing and medical school Ss who mentioned "mother" character types was significantly higher than Ss in any other group except counseling. Other variables showed significant differences between groups of Ss in teaching, counseling, nursing, biology, and accounting. These differences were explainable within the occupational groups sampled. (22 ref) R. Tomasko

3331. Miller, Juliet V. & Benjamin, Libby. (Oakland School, Pontiac MI) **New career development strategies: Methods and resources.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 694-699.—Maintains that expanded goals for career guidance are necessary for effective implementation of life career concepts. Careful evaluation of guidance strategies and the development of new strategies are necessary as goals expand. A selected group of career guidance strategies are proposed, and

sources for further exploration are cited. (58 ref)—G. S. Speer.

3332. Pietrofesa, John J. & Splete, Howard. (Wayne State U) **Career development: Theory and research.** New York, NY: Grune & Stratton, 1975. xi, 254 p.—Provides an overview of several career theories and their current research substantiation. Self-concept in relation to work values and attitudes, occupational personality patterns, social influences, and decision making are examined. (644 ref)

3333. Robinson, Harold R. (U Nebraska) **A comparison of American Indian and White student occupational interests with respect to family background factors.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2312.

3334. Schlossberg, Nancy K. (U Maryland) **Programs for adults.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 681-685.—Discusses some of the issues surrounding the attainment of preferred career goals. It is argued that one of the principal problems in assessing goals, particularly among the 30-60 yr olds, is an information void. The community-based guidance program is suggested as one solution to this problem, and 6 such programs are briefly described.—M. E. Pounsel.

3335. Tiedeman, David V. (ERIC Clearinghouse in Career Education, Northern Illinois U) **Structuring personal integration into career education.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 706-711.—Argues that counselors need to structure comprehension of personal career reintegration during times of successive vocational differentiation. 2 levels of integration that have been designated as needed in facilitating career development are discussed: the level of career theory and the level of organization for career education. (23 ref)—G. S. Speer.

3336. Triki, Mahmoud. (Ohio State U) **Perception of role strain by outside salesmen.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2106.

3337. Varga, F. Louis. (United States International U) **Employment counseling: Categories of involvement and results.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 1632.

3338. Walz, Garry R. (ERIC Counseling & Personnel Services Information Ctr, U Michigan) **Swinging into the future.** *Personnel & Guidance Journal*, 1975(May), Vol 53(9), 712-716.—Anticipates some of the demands that will have an impact on the career development of the citizen of 2000 A.D. An attempt is made to examine career guidance strategies which should be employed now in preparation for the future. Exploring and experiencing are considered to be of the utmost importance in career guidance. It is concluded that the career guidance program must be an integrated and sequential approach rather than unitarian.—G. S. Speer.

Personnel Selection & Training

3339. ———. **"Talking paper" to improve technical training.** *Training & Development Journal*, 1975(Jul), Vol 29(7), 30-32.—Notes that for some training, printed materials and classroom instruction may be replaced by the "sound page system." The system consists of text, drawings, and other technical information on the front side while the back is coated

with magnetic film capable of holding up to 4 min of recorded sound.—R. L. Sulzer.

3340. Fairbanks, Jesse R. (Ohio State U) The relationship of selected secondary school and non-school variates to post-school employability. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2160.

3341. Gleason, Edwin M. (U Tennessee) Stability of dogmatism and relationship of dogmatism to performance in two Air Force officer schools. *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2295.

3342. Morano, Richard. (Xerox Corp, Manufacturing Div, Rochester, NY) Measurement and evaluation of training. *Training & Development Journal*, 1975(Jul), Vol 29(7), 42-46.—Suggests that no training department can afford to neglect the vital functions of measurement and evaluation. Criteria are the greatest problem because of the difficulty of selecting standards that genuinely reflect the value of training to the organization's objectives. A 3-step procedure is proposed. Identify parameters for ranking training needs, determine the kind of training required, and set standards for evaluation and measurement tools. Another integral part of a measurement and evaluation program is systematic screening and counseling to determine who should be taught and the validity of employee training requests.—R. L. Sulzer.

3343. Porret, J. & Frischknecht, E. (Office d'orientation scolaire et professionnelle, La Chaux de Fonds, Switzerland) [The automobile mechanics' apprentices: A study of the validity of a selection procedure.] (Fren) *Psychologie: Schweizerische Zeitschrift für Psychologie und ihre Anwendungen*, 1975, Vol 34(2), 141-159.—4 successive classes ($N = 289$) of candidates for automobile mechanics' apprenticeships were subjected to aptitude and arithmetic achievement tests. The hypotheses guiding the choice of the tests were compared with the results of a factor analysis of the battery and with the predictive validities calculated against success criteria obtained at the end of the apprenticeship. Significant validity coefficients were found for the reasoning (geometric type) and for the psychomotor and/or spatial tests, whereas the visuo-spatial learning tests and a complex pattern test yielded near-zero correlations. The longitudinal study of the sample of Ss revealed difficulties in evaluating the relationships between the aptitudes measured in a predictive psychological examination and those measured at the end of the vocational training. (German & English summaries) (15 ref)—*Journal abstract*.

Personnel Evaluation & Performance

3345. Gerd, M. A. [Man's capacity for work under a special regime in an isolation chamber.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 123-128. Studied the effect of changed day-night rhythm on work performance and nonwork activities of 3 Ss isolated in a $2 \times 3 \times 4$ m chamber inside a submarine. Ss were on a schedule of 6 hrs of sleep, 6 hrs of work, and 6 hrs of other activities and rest. The 18-hr cycles continued to be

the same for each S throughout the experimental period of 20 cycles, except that they were staggered so that one of the Ss was always asleep. Ss were tested throughout the experiment on work activity, reaction time, word associations, and mental arithmetic problems. Adjustment to the new sleep-waking schedule occurred after 11 to 12 cycles when deep and quiet sleep was re-established and sleepiness during the waking periods disappeared. Work performance, however, never reached the pre-experimental level. It is suggested that emotional factors prevented Ss from working at their best.—L. Zusne.

3348. Obermayer, Richard W.; Vreuls, Donald & Conway, Ernest J. (Manned Systems Sciences, Inc, Northridge, CA) Combat-ready crew performance measurement system: Phase IIIA crew performance measurement. *US AFHRL Technical Report*, 1974(Dec), No 74-108(IV), 61 p.—Notes that research for the improvement of US Air Force combat-crew training, and the efficient execution of current training programs, are heavily dependent upon good sources of information about trainee performance during and at the end of training. To improve training performance information, the present study was directed to systematic definition of performance and development of methods for measurement. Initially, emphasis was placed on pilot performance, but with the recognition that the performance of, and interaction between, other crewmembers had more serious consequences than desired, follow-up data collection visits were made to 2 additional combat-crew training units other than the original 6 pilot training units (described in the Phase I report of this project). The present report includes data on crews of fighter and heavy multiengine aircraft, specific related measurement systems, and data processing problems. It is stressed that adequate training methods can be produced through research to resolve crew training and measurement problems and to discover and develop better methods of crew interaction.—B. McLean.

Organizational Behavior & Job Satisfaction

3363. Armenakis, Achilles A.; Feild, Hubert S. & Holley, William H. (Auburn U) **Organizational development in a public agency: A case study.** *Training & Development Journal*, 1975(Apr), Vol 29(4), 52-55.—Describes the procedures of 6 university professors who came in as change agents to investigate organizational improvement in a previously mismanaged state government department with 60 employees. After interviewing all employees, a written questionnaire was developed. This resulted in identifying 33 problem areas, later reduced to 12 critical problems. These were ranked for criticality by employees and categorized as internal or external to the organization. Recommended fixes were then developed and discussed. This led to a new analysis of the jobs and new job descriptions, a reorganization guided by current objectives transactions and congruent with available resources. Since space was a critical problem, a new building was designed. A reputable group was recruited to evaluate the effectiveness of the department's progress. This simple approach to organizational development met with enthusiastic support by the agency's personnel.—*R. L. Sulzer.*

3364. Bulák, Jozef. (Ústav ekonomiky a organizácie stavebnictva, Bratislava, Czechoslovakia) **[The structure of the wage stimulus.]** (Czech) *Československá psychologie*, 1974, Vol 18(2), 97-114.—A factorial analysis of responses of 200 construction workers to a questionnaire yielded 4 factors: (a) direct and controlled exchange of work for wages; (b) social recognition of the work, leading to long-term remuneration; (c) retention of individual choice and control of work behavior; and (d) preference for attractiveness of the work and social affiliation over wage-stimulus value. The 1st and 3rd factors were correlated with job dissatisfaction and turnover; the 2nd factor was correlated with efficiency, satisfaction, and job stability. These results indicate that every stimulus is related not only to present needs but to anticipated future needs which modify present behavior. Since direct control of behavior through the wage system lacks long-term influence, it is less effective than interpersonal relationships and the social environment for structuring reward. (Russian & English summaries) (25 ref)—*P. Babarik.*

3365. Cangemi, Joseph P. & Mitchell, Dewayne W. (Western Kentucky U) **A brief psychology of healthy**

and unhealthy organizations. *Psychology*, 1975(May), Vol 12(2), 46-50.—Behavioral cues found within organizations having serious difficulties are noted, with jealousy considered a strong motive leading to organizational dysfunction. Organizations are encouraged to maintain a sense of positive personal worth for their members; superior-subordinate relations should be supportive and ego building. 12 questions are presented as indicators of an organization's orientation. Self-actualization and leadership are discussed, and 31 of A. Maslow's (1965) assumptions about people in organizations are reviewed.—R. Tomasko.

3366. DiMarco, Nicholas. (U Missouri, St Louis) **Life style, work group structure, compatibility, and job satisfaction.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 313-322.—Reports results of a study examining relationships between life-style, work group structure, compatibility, and job satisfaction. Life-style, life-style-group structure, co-worker life-style, and superior-subordinate life-style dimension compatibility variables were found to provide predictive capabilities. (24 ref)

3367. Downey, H. Kirk; Sheridan, John E. & Slocum, John W. (Oklahoma State U) **Analysis of relationships among leader behavior, subordinate job performance and satisfaction: A path-goal approach.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 253-262.

3368. Fetters, Michael L. (U Wisconsin) **Accounting for extraordinary gains and losses: An empirical analysis of the behavioral consequences.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 931.

3369. Guido, Lawrence C. (United States International U) **Utilizing value analysis to diagnose individual and group enhancement or deprivation in organization development.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2026.

3370. Hall, Kevin R. & Ritchie, Eric. (DSIR, Physics & Engineering Lab, Wellington, New Zealand) **A study of communication behaviour in an R & D laboratory.** *R & D Management*, 1975(Jun), Vol 5(3), 243-245.—The main factors influencing communication flow in a pharmaceutical applied research and development laboratory are identified and the role of basic human characteristics in determining both communication behavior and performance are studied and discussed.

3371. Hartman, James B. (Algoma U Coll, Saulte Ste Marie, Canada) **Collective bargaining in the university.** *Interchange*, 1975, Vol 6(1), 32-43. Discusses the background of bargaining, its subject matter, problems, effects, current state, and future prospects. A section on methods of impasse resolution considers bargaining as a mode of conflict resolution lying between limited war and problem solving, and discusses techniques such as advisory arbitration, compulsory arbitration, and strikes.—H. E. Yaker.

3372. Kalra, Satish K. (Fertilizer Corporation of India, New Delhi) **Deteriorating performance and morale.** *Indian Manager*, 1974(Apr-Jun), Vol 5(2), 204-205.—Describes the working environment in an engineering company to illustrate how defective human relationships can lower employee performance and cause dissatisfaction among employees. It is also pointed out

that employee morale can be lower if professional skills are not properly utilized.

3373. Knowles, M. C. (Monash U, Clayton, Australia) **Interdependence among organizational variables.** *Human Relations*, 1975, Vol 28(5), 431-449.—Investigated the interrelationships between organizational variables, using a matrix analysis assessing 10 variables in 14 work organizations within a company. Variables included production, quality, cost, job satisfaction of operatives, job satisfaction of supervisors, work anxiety, accidents, absence, labor turnover, and industrial unrest. Individual ranking measures of sections showed wide and consistent differences between sections, while variables were clearly interrelated within sections. This interdependence of organizational behavior was characterized in one group by high performance achievement, favorable attitudes, and organizational stability; another group was characterized by low achievements, considerable dissatisfaction, and organizational instability. Both types of situations tended to be self-reinforcing and self-perpetuating. (32 ref)—W. W. Meissner.

3374. Leister, Douglas V. & MacLachlan, Douglas L. (US Dept of Transportation, Washington, DC) **Organizational self-perception and environmental image measurement.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 205-223.—Reports relative perceptions of 12 higher educational institutions in western Washington state with respect to organizational self-perception and environmental image. Organizational and managerial implications inherent in the relative perceptions are drawn. The research methodology employed is multidimensional scaling and multidimensional unfolding. (27 ref)—*Journal abstract*.

3375. Mauer, K. F. (Chamber of Mines, Human Resources Lab, Johannesburg, South Africa) **The utility of the Leadership Opinion Questionnaire in the South African mining industry.** *Journal of Behavioural Science*, 1974, Vol 2(2), 67-72.—Administered the Leadership Opinion Questionnaire to a sample of 190 mine overseers and shift bosses in the South African gold mining industry to investigate the psychometric properties of the instrument. Neither a varimax rotation nor an orthogonal target rotation of the 2 factors extracted approximated the findings of other researchers. An oblique target rotation produced the closest, although relatively unsatisfactory, solution. The correlation between the factors was much higher than that found in other studies. While the poor results may be a function of the mining sample, caution is advised about applying the instrument to other South African populations before the instrument has been more thoroughly investigated. (25 ref) *Journal abstract*.

3376. Peterson, Richard B. (U Washington, Seattle) **The interaction of technological process and perceived organizational climate in Norwegian firms.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 208-209.

Tested the link between technological process and perceptions of organizational climate for 136 professional, technical, and managerial employees in 18 large Norwegian firms. The firms broke down by technology as follows: small batch, 2; large batch mass, 9; and process, 4. 3 firms were not associated with a production technology. Results bear out earlier work by R. B. Stogdill

(1964). M. Fullan (1970), and J. Woodward (1958, 1965, 1970) showing more open climates in small batch and process technologies than for mass assemblies. (37 ref) —*Journal abstract*.

3377. Petty, M. M. & Lee, Gordon K. (U Alabama, Graduate School of Business) **Moderating effects of sex of supervisor and subordinate on relationships between supervisory behavior and subordinate satisfaction.** *Journal of Applied Psychology*, 1975(Oct), Vol 60(5), 624-628.—165 employees of an academic institution described their supervisors with the Supervisory Behavior Description and completed the Job Descriptive Index. Major findings show that (a) supervisor consideration was generally positively correlated with subordinate satisfaction, (b) initiating structure was generally uncorrelated with subordinate satisfaction, and (c) these relationships applied to both male and female subordinates.

3378. Rub, Robert A.; White, J. Kenneth & Wood, Robert R. (Medina & Thompson, Inc, Chicago, IL) **Job involvement, values, personal background, participation in decision making, and job attitudes.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 300-312.—Reports results of a study showing job involvement to be affected by both individual differences and characteristics of the job situation. Job involvement may also be a poor moderator of relationships between job characteristics and attitudes. (31 ref)

3379. Schwartz, Theodore M.; Moscato, Donald R. & Shapiro, H. Jack. (Iona Coll, Graduate Div of Business) **Characteristics of organizational climate and managerial job satisfaction: An empirical study.** *Psychological Reports*, 1975(Aug), Vol 37(1), 299-305.—Investigated the impact of perceived organizational climate on managerial job satisfaction of 114 managerial personnel (mostly males under age 35) who completed a 3-part questionnaire which solicited demographic information and the identification of and preferences for specific characteristics of organizational climate. Ss had a strong preference for open as opposed to closed characteristics of organizational climate; to the degree they claimed to be familiar with the behavioral science theories of management there was an increasingly favorable disposition toward the theories; and among those Ss who perceived closed characteristics, there was a desire for a diminution of the impact of those characteristics. (16 ref)

—*Journal abstract*.

3380. Shearer, Richard L. & Steger, Joseph A. (US Air Force Space & Missile Systems Organization, Los Angeles Air Force Station, CA) **Manpower obsolescence: A new definition and empirical investigation of personal variables.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 263-275.—Of 12 major determinants of managerial and technical job obsolescence, high need achievement and high levels of organizational participation were found to be the major contributors to nonobsolescence. Respondents to a questionnaire were 451 officers and civilian personnel of the US Air Force. All were professionals, and 165 of them were also managers. Average age was 36 yrs and average government service experience was 13 yrs. Managerial obsolescence, as opposed to professional obsolescence, tended

to depend more on experience and less on education. (18 ref) —*Journal abstract*

3381. Stecker, Albert L. (Indiana U, Graduate School of Business) **A two factor behavioral theory of industrial absenteeism.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 951.

3382. Stinson, John E. & Johnson, Thomas W. (Ohio U, Ctr for Leadership Studies) **The path-goal theory of leadership: A partial test and suggested refinement.** *Academy of Management Journal*, 1975(Jun), Vol 18(2), 242-252.—Tested hypotheses derived from the path-goal theory of leadership: (a) The relationships between leader initiating structure and satisfaction variables and role clarity variables are more positive under conditions of low task structure, low task repetitiveness, and high task autonomy than under high task structure, high task repetitiveness, and low task autonomy. (b) The relationships between leader consideration behavior and satisfaction variables and role clarity variables are more positive under conditions of high task structure, high task repetitiveness, and low task autonomy than under conditions of low task structure, low task repetitiveness, and high task autonomy. Data were obtained from a total of 90 23-60 yr old military officers, Civil Service personnel, and project engineers. Results support the theory with respect to consideration but tend to counter the theory regarding initiating structure. An extension of the path-goal theory is suggested.—*Journal abstract*.

3383. Tagliere, Daniel A. **What an executive should know about organization development.** *Training & Development Journal*, 1975(Jul), Vol 29(7), 34-40.—Summarizes the relatively new field of organizational development with emphasis on its potential help in meeting the needs of owners, clients, and society as well as making the organization itself more successful.—R. L. Sulzer.

Human Factors Engineering

3384. Malfetti, James L. (Teachers Coll, Columbia U) **Reeducation and rehabilitation of the drunken driver.** *Journal of Drug Issues*, 1975 (Spr), Vol 5(3), 255-269.—Describes a course designed to deal with the problem of persons driving while intoxicated (DWI). The development, content, and evaluation of the course are described, and 3 instruments designed to measure DWI knowledge and attitudes are outlined (the DWI Knowledge Inventory, the Drinking and Driving Opinion Survey, and Behavioral Description Scales). Data from pre- and postcourse evaluations of participants are presented. Adjunct counseling services that can be provided and guidelines for assisting the problem drinker are discussed. (23 ref)—L. Gorsey.

3385. Strub, M. H. **Automated aids to on-line tactical data inputting.** *US Army Research Institute for the Behavioral & Social Sciences Technical Paper*, 1975(Feb), No 262, 21 p.—Describes a computer-assisted message inputting aid (CAMI) designed to provide useful additional formatting instructions to operators of automated information systems. Data from 60 enlisted men show that no significant differences in speed or accuracy could be attributed to the use of the CAMI aid or a checklist method format. Over 80% of the total input

errors were types which would not have been detected by a computer error-checking routine.

3386. **Thoman, W. H.; Drury, C. G. & Zajkowski, M. M.** (State U New York Buffalo) **Ergonomics in action: Human factors at SUNY at Buffalo.** *Applied Ergonomics*, 1975(Sep), Vol 6(3), 159-163.—Reviews the historical background of the State University of New York (SUNY) at Buffalo and describes past and ongoing teaching efforts, theoretical and applied research, and future plans. Described is the work being conducted in the Human Factors laboratory—work combining techniques of traditional industrial engineering and experimental psychology (e.g., research in the areas of highway safety, environmental impact, health services applications in medicine and dentistry, and application of ergonomics techniques in hospitals and ambulances). The soon-to-be commissioned Industrial Engineering building with its human factors laboratory complex is discussed. The heart of the complex is to be a dedicated real-time control minicomputer, specified to provide monitoring and control of a variety of instructional and research experimental tasks.—*P. O'Brien*.

Environmental Psychology & Environmental Issues

3387. **Berland, Theodore.** (Northwestern U, School of Journalism) **Silence for society's sake.** *Humanitas*, 1975(May), Vol 11(2), 133-146.—Describes adverse effects of noise on speech, sleep, and arousal. (28 ref)—*W. K. Redican*.

3388. **Brown, Lester R.** (Overseas Development Council, Washington, DC) **Putting the brakes on population growth.** *Carnets de l'Enfance*, 1975(Apr-Jun), No 30, 51-59.—Argues that ecological stresses caused by continually increasing demands for food are beginning to undermine major food-producing systems, and constant population growth is tending to reduce individual options for development. The stabilization of population growth is therefore considered essential.—*Z. M. Cantwell*.

3389. **Carpenter, Stanley S.** (United States International U) **User satisfaction with a planned physical environment.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-A), 2025.

3390. **Leroy, Claude.** (Inst Marcel Rivière, Le Mesnil-St-Denis, France) **[Housing and mental health: Essay on spatial-temporal parameters of city dwellers.]** (Fren) *Psychiatria Clinica*, 1974, Vol 7(4-5), 237-270.—Draws data from several field studies to specify the relationships between the territory of human city dwellers, their self-images, and those of others. When certain conditions are not met, various mental illnesses arise. This is noted to be because, in territorial spatial arrangement, the need to consider the complexity of urban living and planning is governed by financial decisions. It is concluded that savings in financial planning in city management is an excessive price to pay for impaired health and welfare. (69 ref) *English abstract*.

3391. **Mehrabian, Albert & Russell, James A.** (U California, Los Angeles) **Environmental effects on affiliation among strangers.** *Humanitas*, 1975(May), Vol 11(2), 219-230. Discusses effects of physical surroundings on 3 polar pairs of emotions (pleasure-displeasure,

arousal-nonarousal, and dominance-submission) in studies of affiliation among strangers.—*W. K. Redican*.

3392. **Platzer, Willard B.** (U Arkansas) **An analysis of ecologically motivated consumer purchase behavior.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2101-2102.

3393. **Shepherd, Michael.** (U London, Inst of Psychiatry, England) **Pollution and mental health, with particular reference to the problem of noise.** *Psychiatria Clinica*, 1974, Vol 7(4-5), 226-236.—Argues that, although the adverse psychological effects of noise as an environmental pollutant are well recognized, much of the relevant work has been focused on the ambiguous concept of "annoyance." A review of the evidence suggests that the relationship between noise and mental illness calls for more direct investigation. In particular, the marked individual variation in reactions to noise requires elucidation. (29 ref)—*Journal abstract*.

3394. **Suavé, Jeanne.** (Ministry of the Environment, Ottawa, Canada) **Population growth and natural resources.** *Carnets de l'Enfance*, 1975(Apr-Jun), No 30, 44-50.—Asserts that solution of the major problems inherent in population growth, food shortage, etc, depends on recognition of fundamental links between population and resources, of the interdependency among nations, and of the need to adapt styles of life to these realities.—*Z. M. Cantwell*.

Marketing & Advertising

3395. **Charlton, P. & Pymont, B.** (London Business School, England) **Evaluating marketing alternatives.** *Journal of the Market Research Society*, 1975(Apr), Vol 17(2), 90-103.—Illustrates the use of the Mini-Test Market operational procedure and models of buyer behavior to measure and evaluate a specific marketing promotion. Their use in building a comprehensive body of information on consumer dynamics is detailed.

3396. **Fennell, Geraldine.** (Fordham U) **Motivation research revisited.** *Journal of Advertising Research*, 1975(Jun), Vol 15(3), 23-28.—Suggests the use of "motivation" to refer to the conditions under which brand purchase behavior is activated and to the general direction of the behavior activated. 5 motivating situations are identified, each consisting of an activating condition and a behavior mode. This situational emphasis of the motivational typology is expected to increase the ability of personality constructs to explain brand purchases.—*Journal summary*.

3397. **Gronhaug, Kjell.** **How new car buyers use advertising.** *Journal of Advertising Research*, 1975(Febr), Vol 15(1), 49-53. Examined personality and demographic variables of 96 Norwegian new car purchasers' use of advertising as input for making their buying decisions. Interview results show that, compared with non-ad readers, ad readers were higher in driving experience, innovativeness, interest, and venturesomeness and lower in general self-confidence.—*J. C. Franklin*.

3398. **Harrell, Gilbert D.** (Pennsylvania State U) **Modeling physician prescribing behavior: Attitudes, normative beliefs, motivation to comply, confidence, behavioral intention and behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 940-941

3399. **Hodgson, Peter.** Sampling racial minority groups. *Journal of the Market Research Society*, 1975(Apr), Vol 17(2), 104-106.—Reviews the difficulties of sampling racial minorities in Britain and suggests that survey research does not adequately represent them. The radical differences of opinion held by ethnic minorities and their underrepresentation in election registers are noted.

3400. **Horowitz, Irwin A. & Kaye, Russell S.** (U Toledo) **Perception and advertising.** *Journal of Advertising Research*, 1975(Jun), Vol 15(3), 15-21.—Self-theory, cognitive dissonance, product attributes, pupillography, and direction of gaze are discussed in terms of their perceptual roles in consumer response to advertising. (39 ref)—J. C. Franklin.

3401. **Horton, Raymond L.** (Indiana U, Graduate School of Business) **Personality as a moderator variable in the purchase decision.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 942.

3402. **Jarvis, Lance P.** (Pennsylvania State U) **An empirical investigation of cognitive brand loyalty and product class importance as mediators of consumer brand choice behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 943.

3403. **Pickering, J. F.** (U Manchester, Inst of Science & Technology, England) **Verbal explanations of consumer durable purchase decisions.** *Journal of the Market Research Society*, 1975(Apr), Vol 17(2), 107-113.—Qualitative explanations from respondents (282 households) for the timing of decisions to buy or not buy included ability, need, and willingness to buy, along with peer group and family pressures. Forecasters are encouraged to concentrate on influences likely to change in importance over time.

3404. **Riley, Stuart & Palmer, John.** (U Lancaster, Tourism Research Unit, England) **Of attitudes and latitudes: A repertory grid study of perceptions of**

seaside resorts. *Journal of the Market Research Society*, 1975(Apr), Vol 17(2).—Used the repertory grid technique to map 60 respondents' attitudes to seaside resorts. The technique was used in full, not merely as a device for construct elicitation, and various complementary types of analysis were applied to the data. Results indicate considerable pay-off to extending this "qualitative" technique into the quantitative area. Future analytic developments are considered briefly as is the decisional outcome of the research.—*Journal summary.*

3405. **Schuhmann, Frank K.** (U Colorado) **Personal values and consumer behavior.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 949.

3406. **Singh, P.** (Xavier Labour Relations Inst, Jamshedpur, India) **Fear appeals in advertising.** *Indian Manager*, 1974(Apr-Jun), Vol 5(2), 178-192.—Presents an analysis of the concept of fear and reviews studies on the use of fear appeals in advertising. No support is found for their use.

3407. **Taylor, Robert H.** (Indiana U, Graduate School of Business) **Development and test of a procedure for defining market segments using purchasing behavior and household descriptors.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 952.

3408. **Tongberg, Richard C.** (Pennsylvania State U) **An empirical study of relationships between dogmatism and consumer attitudes toward foreign products.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-A), 953-954.

3409. **Woodside, Arch G. & Waddle, Gerald L.** (U South Carolina) **Sales effects of in-store advertising.** *Journal of Advertising Research*, 1975(Jun), Vol 15(3), 29-33.—Reports that sales of instant coffee were increased by a reduced price and by point-of-sale advertising, and increased even more when the 2 promotion methods were combined.—J. C. Franklin.

BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Index Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "early infantile autism."

Adoptive Parents 2276
Adrenal Cortex Hormones [See Hydrocortisone]
Adrenal Gland Secretion 2012
Adrenal Medulla Hormones [See Norepinephrine]
Adrenalectomy 2040
Adrenergic Blocking Drugs 2045, 2088, 2106, 2108, 2110
Adrenergic Drugs [See Also Amphetamine, Dextroamphetamine] 2067
Adrenocorticotropin [See Corticotropin]
Adrenolytic Drugs [See Chlorpromazine]
Adult Education 2206, 2896, 2897, 2907, 2913, 2950, 2961, 3061, 3108

Adulthood [See Adults]
Adults [See Also Aged, Middle Aged, Young Adults] 2163, 2169, 2251, 2253, 2319, 2445, 2490, 2544, 2556, 2750, 2778, 2896, 3192, 3334
Advertising 3397, 3400, 3402, 3406, 3409
Aerospace Personnel [See Aircraft Pilots]
Aesthetic Preferences 2153, 2174, 3148
Aetiology [See Etiology]
Affective Disturbances [See Also Depression (Emotion), Psychotic Depressive Reaction, Reactive Depression] 2472
Affective Psychosis [See Psychotic Depressive Reaction]
Affiliation Motivation 2939, 3328
Africa 1711, 2489, 2817, 2820, 3125, 3153, 3311, 3375
Aftercare 2770
Aftereffect (Perceptual) [See Perceptual Aftereffect]
Age Differences 1815, 1824, 2143, 2167, 2174, 2185, 2188, 2191, 2193, 2198, 2206, 2214, 2217, 2219, 2231, 2250, 2279, 2319, 2332, 2924, 2943, 3022, 3111, 3166, 3169, 3182, 3214, 3216, 3258, 3264, 3276, 3392
Aged 1755, 2159, 2161, 2169, 2227, 2238, 2239, 2240, 2242, 2243, 2247, 2248, 2250, 2251, 2252, 2407, 2426, 2432, 2445, 2530, 2544, 2551, 2768
Agencies (Groups) [See Organizations]
Aggressive Behavior [See Also Animal Aggressive Behavior, Attack Behavior, Conflict, Threat Postures, Violence, War] 2128, 2131, 2205, 2234, 2265, 2332, 2349, 2357, 2368, 2454, 2520, 3251
Aggressiveness 2265, 2498, 2542
Agility (Physical) [See Physical Agility]
Aging (Physiological) [See Physiological Aging]
Agitated Depression [See Depression (Emotion)]
Agonistic Behavior [See Aggressive Behavior]
Agricultural Workers [See Also Migrant Farm Workers] 2308
Air Force Personnel 2388, 3341, 3348
Aircraft Pilots 3344, 3348
Alcohol Drinking Patterns 2501, 2769, 2815
Alcohol Intoxication 2123, 2126, 3384
Alcoholic Psychosis 2807
Alcoholics Anonymous 2807
Alcoholism 2492, 2501, 2504, 2731, 2802, 2803, 2804, 2806, 2807, 2810, 2811, 2813, 2814, 2815, 2940
Alcohols [See Ethanol, Tetrahydrocannabinol]
Alexia [See Aphasia]
Algebra [See Mathematics Education]
Algorithms 1877
Alienation 2145, 2229, 2922, 2943

BRIEF SUBJECT INDEX

- Alkaloids [See Also Apomorphine, Caffeine, Mescaline, Morphine, Reserpine, Scopolamine, Strychnine] 2069
- Alpha Rhythm 1970
- Alphabets [See Initial Teaching Alphabet, Letters (Alphabet)]
- Altitude Effects 2112
- Alzheimers Disease 2534
- Ambiguity (Stimulus) [See Stimulus Ambiguity]
- Ambition [See Aspirations]
- American Indians 2263, 2434, 2741, 3101, 3333
- Amine Oxidase Inhibitors [See Iproniazid, Lysergic Acid Diethylamide]
- Amine Oxidases [See Monoamine Oxidases]
- Amines [See Also Amphetamine, Chlorazepoxide, Chlorimipramine, Chlorpromazine, Dextroamphetamine, Dopamine, Guanethidine, Imipramine, Methylphenidate, Norepinephrine, Scopolamine, Serotonin] 2083
- Amino Acids [See Also Dopa, Tryptophan] 2044
- Aminotransferases [See Transaminases]
- Amnesia 2589
- Amphetamine 2010, 2075, 2117, 2118, 2120, 2121
- Amphetamine (D-) [See Dextroamphetamine]
- Amphetamine (DL-) [See Amphetamine]
- Amphetamine Sulfate [See Amphetamine]
- Amphibia [See Frogs]
- Amputation 2532
- Amygdaloid Body 2025, 2028, 2048, 2056
- Anagram Problem Solving 1828, 3301
- Analeptic Drugs [See Picrotoxin, Strychnine]
- Analgesic Drugs [See Also Methadone, Morphine, Scopolamine] 2078, 2086
- Analysis of Covariance 1779
- Analysis of Variance 2669
- Analysts [See Psychoanalysts]
- Analytical Psychotherapy 2621, 2639, 2648, 2649, 2650, 2651, 2653, 2864
- Anatomy [See Also Related Terms] 1955
- Ancestors [See Grandparents, Parents]
- Androgens 1996
- Anemia 2797
- Anesthesia (Feeling) 2104
- Anesthesiology 2722
- Anesthetic Drugs [See Also Chloroform, Pentobarbital] 2063
- Anger [See Also Hostility] 2349, 2397
- Angiotensin 2009
- Angst [See Anxiety]
- Animal Aggressive Behavior [See Also Attack Behavior, Threat Postures] 1930, 1937, 1944, 2007, 2041, 2061, 2076, 2092
- Animal Behavior [See Animal Ethology]
- Animal Biological Rhythms [See Animal Circadian Rhythms]
- Animal Breeding 1953, 1994, 2062, 2090
- Animal Circadian Rhythms 1987, 2111
- Animal Communication [See Also Animal Distress Calls] 1942, 1944
- Animal Courtship Behavior [See Also Animal Courtship Displays] 1934, 1942, 1948
- Animal Courtship Displays 1912, 1935, 1945
- Animal Distress Calls 2032
- Animal Dominance 1927, 1933, 1934, 1936, 1940, 1953, 2065
- Animal Drinking Behavior 1987, 2009, 2010, 2043, 2047, 2108, 2124
- Animal Environments 1912, 1921, 1927, 1928, 1931, 1933, 1936, 1946, 1951, 2010, 2111
- Animal Escape Behavior 1986
- Animal Ethology [See Also Animal Aggressive Behavior, Animal Circadian Rhythms, Animal Communication, Animal Courtship Behavior, Animal Courtship Displays, Animal Distress Calls, Animal Dominance, Animal Drinking Behavior, Animal Escape Behavior, Animal Exploratory Behavior, Animal Feeding Behavior, Animal Hoarding Behavior, Animal Instinctive Behavior, Animal Maternal Behavior, Animal Mating Behavior, Animal Open Field Behavior, Animal Play, Animal Sex Differences, Animal Sexual Receptivity, Animal Social Behavior, Animal Vocalizations, Attack Behavior, Imprinting, Migratory Behavior (Animal), Territoriality, Threat Postures] 1904, 1912, 1936, 1956, 1966
- Animal Exploratory Behavior 2013, 2088
- Animal Feeding Behavior 1903, 1911, 1928, 1987, 1992, 1996, 1997, 2102, 2108
- Animal Hoarding Behavior 1933
- Animal Instinctive Behavior 1937, 1941, 2073
- Animal Maternal Behavior 1938, 2021
- Animal Mating Behavior [See Also Animal Sexual Receptivity] 1907, 1930, 1931, 1932, 1935, 1939, 1942, 1943
- Animal Motivation 1913, 2028, 2092, 2112
- Animal Navigation [See Migratory Behavior (Animal)]
- Animal Open Field Behavior 1921, 2041, 2049, 2109
- Animal Play 2101
- Animal Sex Differences 1907, 1996, 2041
- Animal Sexual Receptivity 1932, 1943
- Animal Social Behavior [See Also Animal Aggressive Behavior, Animal Communication, Animal Courtship Behavior, Animal Courtship Displays, Animal Distress Calls, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Attack Behavior, Threat Postures] 1902, 1903, 1905, 1907, 1909, 1927, 1931, 1934, 1936, 1938, 1940, 1942, 1946, 1950, 1951, 1952, 2209, 2629
- Animal Strain Differences [See Animal Breeding, Genetics]
- Animal Vocalizations [See Also Animal Distress Calls] 1903, 1942, 1945, 1950, 1952, 1958, 2032

BRIEF SUBJECT INDEX

- 2320, 2920, 2956, 2960, 2963, 2966, 2971, 2976, 2979, 2990, 2993, 2994, 3208, 3209, 3293
- School Age Children** 1815, 1818, 1824, 1830, 1841, 1843, 1849, 1858, 1871, 1889, 1891, 2128, 2143, 2156, 2158, 2167, 2168, 2170, 2172, 2174, 2175, 2179, 2182, 2185, 2186, 2187, 2188, 2190, 2191, 2204, 2205, 2213, 2214, 2215, 2216, 2217, 2220, 2222, 2251, 2284, 2346, 2371, 2427, 2442, 2449, 2474, 2503, 2514, 2515, 2522, 2523, 2527, 2604, 2691, 2693, 2695, 2908, 3188, 3191, 3193, 3203, 3209, 3215, 3220, 3306
- School Attendance** 3144, 3147, 3185, 3249, 3284
- School Club Membership** 3177
- School Counselors** 2861, 2919, 2946, 2954, 2959, 2967, 2989, 3230, 3277, 3293
- School Dropouts** 2894, 3121, 3156, 3175, 3183, 3185, 3249, 3279
- School Enrollment** [See Also School Attendance] 3150
- School Environment** 2908, 2909, 2914, 2994, 3145
- School Facilities** [See Also Campuses, Dormitories] 3187
- School Federal Aid** [See Educational Financial Assistance]
- School Financial Assistance** [See Educational Financial Assistance]
- School Integration (Racial)** 2922, 2990, 3126
- School Learning** 2927, 3010, 3064, 3116
- School Organization** [See Educational Administration]
- School Principals** 2329, 2891, 2914, 2930, 2933, 2938, 2942, 2946, 2951, 2955, 2958, 2959, 2970, 2980, 2984, 2985, 2986, 2989, 2995
- School Psychologists** 2860, 3245, 3263
- School Superintendents** 2976, 2982, 2986
- Schools** [See Also Colleges, High Schools, Military Schools, Nursery Schools, Seminaries, Technical Schools] 2220, 2951, 3055
- Science (Social)** [See Social Sciences]
- Science Education** 2997, 2998, 3006
- Sciences** [See Anesthesiology, Applied Psychology, Biochemistry, Child Psychiatry, Child Psychology, Clinical Psychology, Community Psychiatry, Community Psychology, Comparative Psychology, Consumer Psychology, Educational Psychology, Epidemiology, Experimental Psychology, Geography, Geriatrics, Gerontology, Mathematical Psychology, Medical Psychology, Medical Sciences, Neuroanatomy, Neurochemistry, Neurology, Neurophysiology, Psychiatry, Psychology, Psychopathology, Social Psychiatry, Social Psychology, Social Sciences, Sociology, Surgery, Transcultural Psychiatry]
- Scientific Communication** [See Also Professional Meetings And Symposia, Psychological Terminology] 2742, 2821
- Scientific Methods** [See Experimental Methods]
- Scientists** [See Also Related Terms] 2844
- Scopolamine** 2080
- Scopolamine Hydrobromide** [See Scopolamine]
- Scores (Test)** [See Test Scores]
- Scoring (Testing)** 1764, 3225
- Screening (Job Applicants)** [See Job Applicant Screening]
- Secondary Education** 2852, 2967, 3002, 3009, 3014, 3017, 3019, 3048, 3062, 3063, 3112, 3144, 3293
- Secondary Reinforcement** 1916, 2434, 2977, 3024, 3074
- Secretion (Gland)** [See Also Adrenal Gland Secretion, Salivation] 1991
- Sectioning (Lesion)** [See Lesions]
- Security (Emotional)** [See Emotional Security]
- Sedatives** [See Also Chlorpromazine, Haloperidol, Pentobarbital, Phenobarbital, Promethazine, Reserpine, Scopolamine] 2803, 2804
- Segregation (Racial)** [See Racial Integration]
- Seizures** [See Convulsions]
- Selected Readings** 2160, 2758
- Selection (Personnel)** [See Personnel Selection]
- Selective Attention** 1814, 1970, 2005, 2451
- Self Actualization** 1765, 2158, 2219, 2300, 2360, 2381, 2579, 2657, 2662, 2924, 3287, 3297
- Self Assessment** [See Self Evaluation]
- Self Concept** [See Also Self Esteem] 1843, 2208, 2213, 2298, 2316, 2341, 2371, 2383, 2404, 2407, 2425, 2433, 2451, 2614, 2655, 2663, 2671, 2793, 2902, 2922, 2983, 2988, 2996, 3011, 3016, 3017, 3027, 3030, 3047, 3051, 3053, 3055, 3077, 3108, 3113, 3119, 3121, 3125, 3135, 3140, 3147, 3159, 3180, 3190, 3216, 3220, 3228, 3248, 3271, 3284, 3286, 3307, 3308, 3323, 3390
- Self Confidence** [See Self Esteem]
- Self Control** 1999, 2207, 2411, 2675, 2685, 2790, 3042, 3171
- Self Disclosure** 2617, 2657, 3186
- Self Esteem** 1769, 1773, 2197, 2206, 2280, 2297, 2344, 2348, 2383, 2385, 2407, 2410, 2425, 2657, 2671, 2866, 3082, 3089, 3098, 3166, 3169, 3186, 3224, 3264
- Self Evaluation** 1770, 2219, 2341, 2366, 2664, 2787, 3063, 3114, 3160, 3190
- Self Image** [See Self Concept]
- Self Inflicted Wounds** 2490
- Self Perception** 2158, 2248, 2250, 2264, 2295, 2305, 2311, 2316, 2335, 2372, 2389, 2581, 2661, 2892, 2922, 2939, 2958, 2963, 2976, 3113, 3140, 3168, 3286, 3290, 3374, 3400
- Self Realization** [See Self Actualization]
- Self Respect** [See Self Esteem]
- Self Stimulation** 2122
- Semantic Differential** 1764
- Semantics** 1826, 1837, 1840, 2165, 2346
- Seminarians** 3183
- Seminaries** 3292
- Senescence** [See Aged]
- Senile Dementia** 2530, 2534
- Senior Citizens** [See Aged]
- Sensation** [See Perception]
- Sense Organs** [See Cones (Eye), Retina, Rods (Eye)]
- Sensitivity (Drugs)** [See Drug Sensitivity]
- Sensitivity (Personality)** 2638
- Sensitivity Training** 2325, 2335, 2337, 2344, 2657, 2658, 2659, 2660, 2661, 2662, 2663, 2664, 2666, 2667, 2668, 2669, 2670, 2671, 2672, 2673, 2858, 3048, 3142, 3226
- Sensitization Repression** [See Repression Sensitization]
- Sensory Adaptation** [See Also Orienting Responses] 1802
- Sensory Deprivation** 1914, 1915, 1971, 1981, 1985, 2023
- Sensory Feedback** [See Visual Feedback]
- Sensory Motor Processes** [See Perceptual Motor Processes]
- Sensory Neurons** [See Also Cones (Eye), Rods (Eye)] 1969, 1979, 1992, 2020
- Sentence Comprehension** 1826, 1827, 1836, 1887
- Sentence Structure** 1826, 1827, 1836, 1853, 2139, 2147, 2183, 3129
- Sentences** 1850, 1855, 3106
- Separation (Marital)** [See Marital Separation]
- Sephardim** [See Judaism]
- Septum (Brain) Lesions** [See Brain Lesions]
- Sequential Learning** 1877, 3222
- Serial Anticipation (Learning)** 1890
- Serial Learning** [See Also Serial Anticipation (Learning)] 1788, 1848, 1859, 1890, 2167
- Serotonin** 2008, 2066, 2078, 2098, 2101, 2102, 2537
- Serotonin Antagonists** [See Also Lysergic Acid Diethylamide] 2018
- Serpasil** [See Reserpine]
- Serum (Blood)** [See Blood Serum]
- Servicemen** [See Military Personnel]
- Set (Response)** [See Response Set]
- Severely Mentally Retarded** 2520, 2735, 2767
- Sex Differences (Animal)** [See Animal Sex Differences]
- Sex Differences (Human)** [See Human Sex Differences]
- Sex Education** 2295, 2784, 3192
- Sex Hormones** [See Also Androgens, Estradiol, Progesterone] 1996
- Sex Identity** [See Sex Roles]
- Sex Linked Developmental Differences** 2214
- Sex Linked Hereditary Disorders** [See Hemophilia]
- Sex Roles** 2277, 2298, 2299, 2300, 2355, 2385, 2423, 2503, 2542, 2575, 3377
- Sexual Arousal** [See Psychosexual Behavior]
- Sexual Attitudes** 2295
- Sexual Behavior** [See Psychosexual Behavior]
- Sexual Development** 2200
- Sexual Deviations** [See Exhibitionism, Fetishism, Incest]
- Sexual Fetishism** [See Fetishism]
- Sexual Function Disturbances** [See Impotence]
- Sexual Intercourse (Human)** [See Also Incest, Premarital Intercourse] 2200, 2591
- Sexual Receptivity (Animal)** [See Animal Sexual Receptivity]
- Sexuality** 1741
- Shame** [See Guilt]
- Shape Perception** [See Form And Shape Perception]
- Sheltered Workshops** 2787, 2796
- Shock Therapy** [See Electroconvulsive Shock Therapy]
- Shopping** [See Consumer Behavior]
- Short Term Memory** 1857, 1868, 1959, 2015, 2052, 2085, 2123, 2167, 2690
- Short Term Psychotherapy** [See Brief Psychotherapy]
- Shoshone Indians** [See American Indians]

Sibling Relations 2245
Siblings [See Also Monozygotic Twins] 2449, 2538
Side Effects (Drug) [See Also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Drug Sensitivity, Heroin Addiction] 2698, 2705, 2708
Signal Detection (Perception) 1784, 1787, 1794
Signal Intensity [See Stimulus Intensity]
Similarity (Stimulus) [See Stimulus Similarity]
Simulation [See Also Computer Simulation, Flight Simulation, Mathematical Modeling, Stochastic Modeling] 1962, 2814, 2815, 2905, 3350
Simulators [See Simulation]
Sin 1748
Single Persons 2240
Size (Group) [See Group Size]
Skills [See Ability]
Sleep [See Also NREM Sleep, REM Sleep] 1980, 1987, 2006, 2017, 2018, 2090, 2103, 2162
Sleep Deprivation 2031
Sleep Disorders [See Also Insomnia, Narcolepsy] 2469, 2580, 2707, 2708
Sleep Inducing Drugs [See Hypnotic Drugs]
Sleep Onset 2003, 2162, 2552
Slow Learners 3194
Slow Wave Sleep [See NREM Sleep]
Smiles 2199
Snails 2064
Social Acceptance 2348, 2542
Social Adaptation [See Social Adjustment]
Social Adjustment 2482, 2542, 2770, 3029, 3126, 3144, 3149, 3188, 3219, 3266, 3307
Social Approval 3148
Social Behavior [See Also Aggressive Behavior, Animal Aggressive Behavior, Animal Communication, Animal Courtship Behavior, Animal Courtship Displays, Animal Distress Calls, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Animal Social Behavior, Assistance (Social Behavior), Attack Behavior, Attribution, Bargaining, Charitable Behavior, Collective Behavior, Competition, Conflict, Conformity (Personality), Conversation, Cooperation, Criticism, Encouragement, Eye Contact, Friendship, Gambling, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Involvement, Leadership, Leadership Style, Negotiation, Nonverbal Reinforcement, Participation, Peer Relations, Praise, Psychodiagnostic Interview, Reciprocity, Responsibility, Risk Taking, Social Acceptance, Social Adjustment, Social Approval, Social Dating, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Threat Postures, Trust (Social Behavior), Verbal Reinforcement, Violence, War] 2908, 3138, 3295
Social Casework 2761, 2763
Social Caseworkers [See Social Workers]

Social Change 2133, 2230, 2241, 2247, 2271, 2411, 2470, 2749, 2993
Social Class [See Also Lower Class, Middle Class] 2270, 2367, 2457, 3173, 3328
Social Class Attitudes [See Socioeconomic Class Attitudes]
Social Dating 2245, 2295
Social Deprivation [See Also Social Isolation] 1830
Social Desirability 2421, 2952, 3105
Social Environments [See Animal Environments, Classroom Environment, College Environment, Communities, Environmental Adaptation, Home Environment, Kibbutz, Rural Environments, School Environment, Suburban Environments, Urban Environments, Working Conditions]
Social Equality 2339
Social Facilitation 1949
Social Groups [See Dyads, Minority Groups]
Social Immobility [See Social Mobility]
Social Influences [See Also Criticism, Power, Prejudice, Propaganda, Social Approval, Social Desirability, Social Values] 2246, 2312, 2339, 2394, 2411
Social Interaction [See Also Assistance (Social Behavior), Bargaining, Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Encouragement, Eye Contact, Friendship, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Negotiation, Participation, Peer Relations, Psychodiagnostic Interview, Social Dating, Violence, War] 2308, 2313, 2314, 2333, 2334, 2745, 3163, 3175, 3262
Social Isolation 3345
Social Learning [See Imitation (Learning), Imprinting]
Social Maladjustment [See Social Adjustment]
Social Mobility 2900, 2993
Social Movements [See Homosexual Liberation Movement, Student Activism]
Social Perception [See Also Attribution] 2136, 2141, 2142, 2210, 2218, 2219, 2222, 2242, 2250, 2251, 2299, 2312, 2315, 2330, 2331, 2335, 2339, 2341, 2342, 2344, 2345, 2346, 2347, 2348, 2351, 2355, 2357, 2382, 2456, 2492, 2502, 2660, 2661, 2662, 2839, 2841, 2860, 2892, 2955, 3135, 3154, 3177, 3286, 3290, 3317, 3374, 3390
Social Processes [See Also Industrialization, Racial Integration, School Integration (Racial), Social Deprivation, Social Isolation, Social Mobility, Socialization, Urbanization] 2233, 2244, 2318, 3049
Social Programs 2728, 2971
Social Psychiatry 2555
Social Psychology 1758
Social Reinforcement [See Also Nonverbal Reinforcement, Praise, Verbal Reinforcement] 1754, 3058, 3074, 3098, 3105, 3186, 3279
Social Sciences [See Also Applied Psychology, Child Psychology, Clinical Psychology, Community Psychology, Comparative Psychology, Consumer Psychology, Educational Psychology, Experimental Psychology, Gerontology, Math-

ematical Psychology, Medical Psychology, Psychology, Social Psychology, Sociology] 1712, 1762, 2608, 3069
Social Stress 2299, 2299, 2430
Social Structure [See Also Caste System, Lower Class, Middle Class, Social Class] 1875, 1947
Social Values 2159, 2231, 2261, 2379
Social Work [See Social Casework]
Social Workers 2761, 2872, 2885
Socialism 2249
Socialization 2160, 2217, 2275, 2334
Socially Disadvantaged [See Disadvantaged]
Society 2249
Sociocultural Factors [See Also Acculturation, Cross Cultural Differences, Cultural Assimilation, Cultural Deprivation, Culture Change, Ethnic Identity, Initiation Rites] 2241, 2253, 2263, 2364, 2434, 2470, 2489, 2754, 3021, 3101, 3180, 3235
Socioeconomic Class Attitudes 2246
Socioeconomic Status [See Also Family Socioeconomic Level, Income Level, Lower Class, Lower Income Level, Middle Class, Social Class] 2193, 2214, 2220, 2277, 2348, 2366, 2778, 2903, 2923, 2947, 3080, 3111, 3132, 3143, 3182, 3239, 3273, 3279, 3407
Sociograms 2662
Sociology 1777, 2559
Sociometric Tests 1782
Sociopathology [See Antisocial Behavior]
Sodium 2040, 2124
Sodium Pentobarbital [See Pentobarbital]
Somatosensory Cortex 2025, 2096
Somatosensory Evoked Potentials 1963
Somatotypes 1740
Somesthetic Perception [See Cutaneous Sense, Kinesthetic Perception, Pain Thresholds, Tactile Perception]
Somesthetic Stimulation [See Also Tactile Stimulation] 2024
Sons 2212
Sorting (Cognition) [See Classification (Cognitive Process)]
Sound [See Auditory Stimulation]
Sound Pressure Level [See Loudness]
Sourness [See Taste Stimulation]
South America 1768, 2816, 2853, 2854
South Vietnam 2396, 2728
Space (Personal) [See Personal Space]
Spain 2348, 2781
Spatial Discrimination [See Spatial Perception]
Spatial Organization 1874, 2495, 2506
Spatial Orientation (Perception) 1801, 2055
Spatial Perception [See Also Apparent Movement, Distance Perception, Motion Perception, Spatial Organization, Spatial Orientation (Perception)] 1802, 1818, 2052, 2527
Special Education 2498, 3189, 3191, 3192, 3193, 3195, 3196, 3198, 3199, 3201, 3202, 3203, 3206, 3207, 3208, 3209, 3211, 3214, 3215, 3217, 3219, 3221, 3223, 3224, 3263
Special Education (Aurally Handicap) [See Aurally Handicapped, Special Education]
Special Education (Emot Disturbed) [See Emotionally Disturbed, Special Education]

BRIEF SUBJECT INDEX

- Special Education (Gifted)** [See Gifted, Special Education]
Special Education (Learning Disabled) [See Learning Disabilities, Special Education]
Special Education (Mentally Retard) [See Mentally Retarded, Special Education]
Special Education (Phys Handicaps) [See Physically Handicapped, Special Education]
Special Education (Visual Handicap) [See Special Education, Visually Handicapped]
Special Education Students 2953, 3127, 3190, 3194, 3196, 3199, 3200, 3207, 3213, 3216, 3222
Special Education Teachers 2940, 3199, 3208, 3209
Specialization (Academic) [See Academic Specialization]
Spectral Sensitivity [See Color Perception]
Speech [See Verbal Communication]
Speech And Hearing Measures 1809, 2173
Speech Characteristics [See Also Articulation (Speech), Pronunciation, Speech Pauses] 2136, 2141, 2166
Speech Disorders [See Articulation Disorders, Stuttering]
Speech Measures [See Speech And Hearing Measures]
Speech Pauses 2137
Speech Perception 1809, 1810, 1906, 2179, 3191
Speech Processing (Mechanical) [See Compressed Speech]
Speech Therapy 2719
Speed (Response) [See Reaction Time]
Spelling 3060, 3074
Spinal Cord [See Also Spinothalamic Tracts] 1972
Spinal Fluid [See Cerebrospinal Fluid]
Spinothalamic Tracts 2089
Split Personality [See Multiple Personality]
Spokane Indians [See American Indians]
Spontaneous Remission 2522, 2523
Sports [See Also Football] 2336, 2541, 3319
Spouses [See Also Housewives, Wives] 2268, 2273, 2280, 2423, 2481, 2651, 2656
Spreading Depression 2087
Stability (Emotional) [See Emotional Stability]
Stage Plays [See Theatre]
Standardization (Test) [See Test Standardization]
Standards (Professional) [See Professional Standards]
Stanford Binet Intelligence Scale 3244, 3303
State Hospitals [See Psychiatric Hospitals]
Statistical Analysis [See Also Analysis of Covariance, Analysis of Variance, Factor Analysis, Nonparametric Statistical Tests, Predictability (Measurement), Statistical Measurement, Statistical Probability, T Test, Variability Measurement] 1749, 2234
Statistical Correlation 1781
Statistical Measurement [See Also Analysis of Covariance, Analysis of Variance, Factor Analysis, Predictability (Measurement), Statistical Probability, Variability Measurement] 1779
Statistical Reliability 1779
Statistical Tests [See Nonparametric Statistical Tests, T Test]
Statistical Validity [See Predictive Validity]
Statistical Variables [See Also Dependent Variables] 1779, 1781
Status 2244, 2315, 2960
Stealing [See Theft]
Stelazine [See Trifluoperazine]
Stereotaxic Techniques [See Also Chemical Brain Stimulation, Electrical Brain Stimulation, Spreading Depression] 2020
Stereotyped Attitudes 2991, 3377
Stereotyped Behavior 1910, 2008, 2045, 2115
Sterilization (Sex) [See Hysterectomy, Ovariectomy]
Steroids [See Hydrocortisone]
Stimulation [See Auditory Stimulation, Aversive Stimulation, Chemical Brain Stimulation, Electrical Brain Stimulation, Perceptual Stimulation, Self Stimulation, Somesthetic Stimulation, Spreading Depression, Tactual Stimulation, Taste Stimulation, Visual Stimulation]
Stimulus (Conditioned) [See Conditioned Stimulus]
Stimulus (Unconditioned) [See Unconditioned Stimulus]
Stimulus Ambiguity 1836, 2485
Stimulus Complexity 1834, 1841, 1852, 1864
Stimulus Control 1920
Stimulus Deprivation [See Food Deprivation, Sensory Deprivation, Social Deprivation, Social Isolation, Water Deprivation]
Stimulus Discrimination 1823, 1895, 1918, 1920, 1925, 2011, 2013, 2059
Stimulus Duration 1797, 1807, 1976
Stimulus Exposure Time [See Stimulus Duration]
Stimulus Frequency 1916, 2292
Stimulus Intensity 1958, 1978
Stimulus Intervals [See Also Interstimulus Interval] 1783, 1795, 1808, 1812
Stimulus Novelty 1924, 2199
Stimulus Parameters [See Also Interstimulus Interval, Stimulus Complexity, Stimulus Duration, Stimulus Frequency, Stimulus Intensity, Stimulus Intervals, Stimulus Novelty, Stimulus Salience, Stimulus Similarity] 1820, 1860
Stimulus Presentation Methods [See Also Tachistoscopic Presentation] 1789, 1815, 1818, 1837, 1846, 1855, 1866, 1869, 1874, 1888, 1889, 1892, 2191, 2519, 3106, 3191
Stimulus Salience 1925
Stimulus Similarity 1799, 1863, 1881, 1911
Stipends [See Educational Financial Assistance]
Stochastic Modeling 1782
Strain Differences (Animal) [See Animal Breeding, Genetics]
Strategies 1878, 1879, 2353
Stress [See Also Environmental Stress, Occupational Stress, Physiological Stress, Psychological Stress, Social Stress, Stress Reactions] 2276
Stress Reactions 2280, 2403, 2676
Stroboscopic Movement [See Apparent Movement]
Stroke (Cerebrum) [See Cerebrovascular Accidents]
Strychnine 2085
Student Activism 2259
Student Admission Criteria 3321
Student Attitudes 2264, 2303, 2307, 2386, 2898, 2909, 2914, 2952, 2969, 2996, 3005, 3018, 3020, 3029, 3037, 3051, 3060, 3064, 3067, 3070, 3082, 3087, 3111, 3113, 3128, 3137, 3139, 3143, 3147, 3148, 3152, 3154, 3157, 3163, 3164, 3168, 3170, 3172, 3176, 3177, 3178, 3180, 3184, 3186, 3211, 3214, 3228, 3267, 3276, 3280, 3284, 3288, 3290, 3292, 3293, 3309
Student Protest [See Student Activism]
Student Teachers 2926, 2968, 2977, 3141
Student Teaching 2968, 2979
Students [See Also Business Students, College Students, Community College Students, Dental Students, Elementary School Students, Foreign Students, Graduate Students, High School Students, Junior College Students, Junior High School Students, Kindergarten Students, Medical Students, Nursing Students, Roommates, Seminars, Special Education Students, Transfer Students, Vocational School Students] 3035, 3154, 3255
Students T Test [See T Test]
Studies (Followup) [See Followup Studies]
Studies (Longitudinal) [See Longitudinal Studies]
Study Habits 2680, 3002, 3067, 3087, 3118, 3137, 3296
Stuttering 2718
Subconscious 2619
Subcortical Lesions [See Brain Lesions]
Subculture (Anthropological) 2133, 2763
Subjectivity [See Objectivity]
Subliminal Perception 2378
Subprofessional Personnel [See Paraprofessional Personnel]
Substantia Nigra [See Mesencephalon]
Suburban Environments 2440, 3055
Subvocalization 1785, 1887
Success [See Achievement]
Sugars 1926
Suggestibility 1978, 2929
Suicide 2152, 2495, 2497, 2500, 2506, 2783
Suicide (Attempted) [See Attempted Suicide]
Supervisors [See Management Personnel]
Support (For Theories) [See Professional Contribution]
Supportive Psychotherapy [See Psychotherapy]
Suppression (Conditioned) [See Conditioned Suppression]
Surgery [See Also Adrenalectomy, Amputation, Decerebration, Hysterectomy, Induced Abortion, Neurosurgery, Ovariectomy, Psychosurgery, Stereotaxic Techniques] 2722
Surgical Patients 2532
Surveys 1757, 3399
Surveys (Interest) [See Interest Inventories]
Surveys (Opinion) [See Attitude Measures]

BRIEF SUBJECT INDEX

Surveys (Personality) [See Personality Measures]
Surveys (Preference) [See Preference Measures]
Susceptibility (Hypnotic) [See Hypnotic Susceptibility]
Sweden 2301
Sweetness [See Taste Stimulation]
Syllables 3039
Syllogistic Reasoning [See Inductive Deductive Reasoning]
Symbolism 1814, 2158, 3327
Sympatholytic Drugs [See Reserpine]
Sympathomimetic Amines [See Amphetamine, Dextroamphetamine, Dopamine, Norepinephrine]
Sympathomimetic Drugs [See Also Amphetamine, Dextroamphetamine, Dopamine, Fenfluramine, Norepinephrine] 2068, 2097
Symposia [See Professional Meetings And Symposia]
Symptoms [See Also Acting Out, Anorexia Nervosa, Anoxia, Convulsions, Hyperkinesia, Insomnia, Obesity, Pain] 2432, 2467, 2489, 2526, 2544, 2696, 2700, 2710, 2716
Synapses 1981, 2063, 2064, 2082
Syndromes [See Also Alcoholic Psychosis, Alzheimers Disease, Battered Child Syndrome, Downs Syndrome, Organic Brain Syndromes, Senile Dementia] 2737
Synonyms 1850
Syntax [See Also Sentence Structure] 1826, 2147, 2175, 3129
Systematic Desensitization Therapy 2683, 2812, 3267, 3269
Systems Analysis 2814, 2815, 3318

T Groups [See Sensitivity Training]
T Test 2669
Tachistoscopic Presentation 1797, 1803
Tactual Discrimination [See Tactual Perception]
Tactual Perception 2042, 2060, 3215
Tactual Stimulation 1918, 1975, 2024, 2615
Taiwan 3015
Talent [See Ability]
Talented [See Gifted]
Task Complexity 1818, 1871, 1953, 2001, 2042, 3317, 3352
Task Difficulty [See Task Complexity]
Taste Discrimination [See Taste Perception]
Taste Perception 1926, 1975, 2024
Taste Stimulation 1926, 1983
Taxonomies 1751, 1967, 2100, 2127, 2309, 2392, 2928, 3265, 3316, 3396
Tea (Drug) [See Caffeine]
Teacher (Evaluation of) [See Personnel Evaluation, Teachers]
Teacher Aides 2962
Teacher Attitudes 2891, 2912, 2914, 2920, 2923, 2927, 2930, 2933, 2940, 2942, 2943, 2946, 2947, 2951, 2953, 2958, 2969, 2973, 2975, 2984, 2988, 2989, 2992, 3023, 3148, 3158, 3177, 3184, 3208, 3209, 3240, 3246, 3270, 3293, 3305, 3309
Teacher Characteristics [See Also Teacher Attitudes, Teacher Personality] 2924, 2925, 2926, 2935, 2941, 2942, 2944, 2949, 2968, 2969, 2972, 2977, 2981, 2983, 3068, 3095, 3141, 3158, 3164

Teacher Education [See Also Inservice Teacher Education, Student Teaching] 2892, 2917, 2918, 2923, 2926, 2934, 2936, 2943, 2944, 2957, 2964, 2965, 2977, 2981
Teacher Effectiveness [See Teacher Characteristics]
Teacher Personality 2944, 2945, 2981, 2983, 3107
Teacher Student Interaction 2912, 2925, 2941, 2943, 2945, 3027, 3073, 3098, 3101, 3107, 3123, 3141, 3142, 3151, 3154, 3167, 3173, 3186, 3280
Teacher Tenure 2943
Teacher Training [See Teacher Education]
Teachers [See Also College Teachers, Elementary School Teachers, High School Teachers, Junior High School Teachers, Special Education Teachers, Student Teachers] 2891, 2924, 2925, 2927, 2929, 2947, 2949, 2950, 3151, 3261, 3265, 3277, 3305
Teaching [See Also Audiovisual Instruction, Computer Assisted Instruction, Group Instruction, Individualized Instruction, Instructional Media, Lecture Method, Motion Pictures (Educational), Open Classroom Method, Peer Tutoring, Programed Instruction, Reading Materials, Teaching Methods, Team Teaching Method, Televised Instruction, Tutoring, Videotape Instruction] 2892, 3025, 3069, 3146, 3154, 3198
Teaching (Programed) [See Programed Instruction]
Teaching Internship [See Student Teaching]
Teaching Methods [See Also Audiovisual Instruction, Computer Assisted Instruction, Group Instruction, Individualized Instruction, Lecture Method, Open Classroom Method, Peer Tutoring, Programed Instruction, Team Teaching Method, Televised Instruction, Tutoring, Videotape Instruction] 2846, 2849, 2859, 2875, 2904, 2909, 2912, 2916, 2934, 2949, 2957, 2975, 2981, 2997, 2998, 3000, 3001, 3002, 3003, 3006, 3010, 3016, 3018, 3021, 3022, 3028, 3035, 3040, 3042, 3043, 3045, 3048, 3054, 3055, 3062, 3064, 3066, 3068, 3074, 3076, 3078, 3079, 3081, 3083, 3088, 3091, 3092, 3093, 3095, 3099, 3139, 3194, 3195, 3205, 3215, 3228
Team Teaching Method 3138
Technical Schools 2948
Technical Service Personnel 3343
Technology 2229, 3376, 3380
Teenagers [See Adolescents]
Teeth (Anatomy) 1984
Telecommunications Media [See Television]
Telekinesis [See Psychokinesis]
Telencephalon [See Amygdaloid Body, Caudate Nucleus, Cerebral Cortex, Corpus Callosum, Frontal Lobe, Hippocampus, Limbic System, Motor Cortex, Occipital Lobe, Somatosensory Cortex, Temporal Lobe, Visual Cortex]
Telepathy 1901, 2619
Televised Instruction 3070
Television 2300
Television Viewing 2128, 2131, 2132
Temperament [See Personality]
Temperature Effects [See Also Cold Effects, Heat Effects] 1902, 1975, 2773, 2773

Temporal Lobe 2053, 2539
Tension (Premenstrual) [See Premenstrual Tension]
Tenure (Teacher) [See Teacher Tenure]
Terminally Ill Patients 2859
Terminology (Psychological) [See Psychological Terminology]
Territoriality 1927, 1930, 1933, 1936, 1940, 1950, 1991, 2061
Test (Achievement) [See Achievement Measures]
Test (Aptitude) [See Aptitude Measures]
Test (Intelligence) [See Intelligence Measures]
Test Administration 1760, 3152, 3270, 3294, 3304
Test Anxiety 3152, 3166, 3169, 3267, 3269, 3285, 3346
Test Construction [See Also Content Analysis (Test), Item Analysis (Test), Test Items, Test Reliability, Test Standardization, Test Validity] 1767, 1772, 2913
Test Items 3225, 3244
Test Normalization [See Test Standardization]
Test Norms 3264, 3292, 3306
Test Reliability 1766, 1769, 1770, 1771, 1772, 1774, 2173, 3275, 3292, 3310
Test Scores 2471, 3270, 3315, 3346
Test Standardization 1768, 3261
Test Validity 1766, 1770, 1773, 1775, 1776, 2543, 2842, 3250, 3275, 3291, 3292, 3306, 3310, 3346
Testing [See Content Analysis (Test), Item Analysis (Test), Scoring (Testing), Test Administration, Test Items, Test Reliability, Test Standardization, Test Validity]
Testing (Job Applicant) [See Job Applicant Screening]
Testing Methods [See Also Multiple Choice (Testing Method), Q Sort Testing Technique] 1760, 3087, 3227
Tests [See Measurement]
Tests (Personality) [See Personality Measures]
Tetrahydrocannabinol 2070, 2071, 2079
Thalamus [See Also Geniculate Bodies (Thalamus)] 2049, 2107
Theatre [See Also Drama] 2145, 2599
Theft 2438, 2455
Thematic Apperception Test 2105
Theology [See Religion]
Theories of Education 2906, 3043
Theories [See Also Related Terms] 1724, 1731, 1736, 1738, 1747, 1749
Therapeutic Abortion [See Induced Abortion]
Therapeutic Community 2632, 2754, 2775
Therapeutic Techniques (Psychother) [See Psychotherapeutic Techniques]
Therapist Attitudes [See Therapist Characteristics]
Therapist Characteristics 2575, 2616, 2618, 2621, 2642, 2651, 2652, 2684
Therapist Effectiveness [See Therapist Characteristics]
Therapist Experience [See Therapist Characteristics]
Therapist Patient Interaction [See Psychotherapeutic Processes]
Therapist Personality [See Therapist Characteristics]
Therapists [See Also Related Terms] 2825, 2858

BRIEF SUBJECT INDEX

- Therapy** [See Treatment]
Therapy (Drug) [See Drug Therapy]
Therapy (Encounter Group) [See Encounter Group Therapy]
Therapy (Music) [See Music Therapy]
Thermoregulation (Body) 2097, 2108
Thinking See Also Abstraction, Divergent Thinking, Inductive Deductive Reasoning, Inference, Logical Thinking] 1839, 2184, 2981, 3008, 3040, 3174, 3258
Thioridazine 2693, 2700, 2704
Thiothixene 2688
Thorazine [See Chlorpromazine]
Thought Disturbances [See Also Amnesia, Delusions, Fantasies (Thought Disturbances), Memory Disorders, Obsessions] 2622
Threat 2353, 2408
Threat Postures 2026
Thresholds [See Auditory Thresholds, Pain Thresholds, Sensory Adaptation, Visual Thresholds]
Thyroid Stimulating Hormone [See Thyrotropin]
Thyrotropic Hormone [See Thyrotropin]
Thyrotropin 2701
Time [See Also Interresponse Time] 1720, 1732, 1848, 1980, 2166, 2390
Time (Interresponse) [See Interresponse Time]
Time Estimation 1795
Time Perception [See Also Time Estimation] 1732, 1776, 1784, 1793, 1797, 2390, 2715
Tissues (Body) [See Membranes]
Toes (Anatomy) [See Feet (Anatomy)]
Tofranil [See Imipramine]
Toilet Training 2561
Token Economy Programs 2680, 2777, 2814, 2815
Token Reinforcement [See Secondary Reinforcement]
Tolerance (Drug) [See Drug Tolerance]
Tone (Frequency) [See Pitch (Frequency)]
Tongue 1785, 1975, 2024
Top Level Managers 3353, 3357
Tortoises [See Turtles]
Touch [See Tactile Perception]
Toxic Disorders [See Also Alcohol Intoxication, Toxic Encephalopathies] 2490, 2710
Toxic Encephalopathies [See Also Alcohol Intoxication] 2526
Toxicity 2099, 2111
Toy Selection 2214
Tracking [See Also Rotary Pursuit] 1898
Traditionalism [See Political Conservatism]
Trainable Mentality Retarded 2520, 3195, 3199, 3203, 3207
Training [See Education]
Training (Clinical Methods) [See Clinical Methods Training]
Training (Clinical Psychology Grad) [See Clinical Psychology Grad Training]
Training (Community Mental Health) [See Community Mental Health Training]
Training (Graduate Psychology) [See Graduate Psychology Education]
Training (Mental Health Inservice) [See Mental Health Inservice Training]
Training (Personnel) [See Personnel Training]
Training (Psychiatric) [See Psychiatric Training]
Training (Psychoanalytic) [See Psychoanalytic Training]
Training (Psychotherapy) [See Psychotherapy Training]
Tranquilizing Drugs [See Also Benactyzine, Chlordiazepoxide, Chlorpromazine, Diazepam, Haloperidol, Mesoridazine, Neuroleptic Drugs, Perphenazine, Phenothiazine Derivatives, Reserpine, Thioridazine, Thiothixene, Trifluoperazine] 2703
Transaminases 2450
Transcultural Psychiatry 2475, 2489
Transfer (Learning) [See Also Negative Transfer, Positive Transfer] 1885, 1923, 2042, 2412, 3344
Transfer Students 3238
Transferases [See Also Transaminases] 2012
Transference (Psychotherapeutic) [See Psychotherapeutic Transference]
Transformational Generative Grammar 1826
Transportation [See Ground Transportation, Public Transportation]
Trauma (Emotional) [See Emotional Trauma]
Trauma (Physical) [See Injuries]
Traumatic Psychosis [See Reactive Psychosis]
Treatment Effectiveness Evaluation 2269, 2437, 2550, 2553, 2557, 2558, 2560, 2563, 2565, 2590, 2642, 2678, 2777, 2782, 2795, 2802, 2882, 3171
Treatment Facilities [See Child Guidance Clinics, Clinics, Community Mental Health Centers, Halfway Houses, Hospitals, Nursing Homes, Psychiatric Clinics, Psychiatric Hospitals]
Treatment [See Also Related Terms] 1745, 2283, 2491, 2536, 2552, 2559, 2721, 2723
Trifluoperazine 2093
Trigeminal Nerve 1984
Trochlear Nerve [See Cranial Nerves]
Trust (Social Behavior) 2228
Tryptophan 2446
Turnover [See Employee Turnover]
Turtles 1941
Tutoring [See Also Peer Tutoring] 3036, 3084
Tutors [See Teachers]
Twins [See Monozygotic Twins]
Typologies (Psychodiagnostic) [See Psychodiagnostic Typologies]
Unconditioned Stimulus 1916
Unconscious (Personality Factor) 2400, 2415
Underachievement (Academic) [See Academic Underachievement]
Undergraduate Degrees [See Educational Degrees]
Undergraduates [See College Students]
Underprivileged [See Disadvantaged]
Underweight [See Anorexia Nervosa]
Union of South Africa 2290
Union of Soviet Socialist Republics 1740, 1742, 1838, 2234
United States 1713, 2159, 2225, 2243, 2260, 2261, 2348, 2386, 2805, 2831, 2833, 3282
Universities [See Colleges]
Unwed Mothers 2296
Upward Bound 3224
Urban Environments 2235, 2239, 2254, 2367, 2430, 2440, 2516, 2920, 3049, 3058, 3102, 3125, 3135, 3212, 3235, 3390
Urbanization 2229, 2367, 2749
Urination 1909, 2561, 2773
Urogenital Disorders [See Premenstrual Tension]
Urogenital System [See Female Genitalia, Ovaries]
Validity (Test) [See Test Validity]
Valium [See Diazepam]
Values [See Also Personal Values, Social Values] 2243, 2308, 2327, 2903, 3016, 3093, 3246, 3369, 3389
Variability Measurement [See Also Analysis of Covariance, Analysis of Variance] 1910
Variables (Statistical) [See Statistical Variables]
Variance [See Variability Measurement]
Vasodilator Drugs 2089
Vasodilator Drugs 2089
Verbal Ability 2422, 2513, 3127, 3129, 3178
Verbal Communication [See Also Adjectives, Articulation (Speech), Bilingualism, Compressed Speech, Conversation, Dialect, Foreign Languages, Form Classes (Language), Grammar, Handwriting, Initial Teaching Alphabet, Language, Language Development, Letters (Alphabet), Linguistics, Nonstandard English, Orthography, Phonemes, Phonetics, Pronouns, Pronunciation, Psycholinguistics, Public Speaking, Semantics, Sentence Structure, Sentences, Speech Characteristics, Speech Pauses, Syllables, Synonyms, Syntax, Transformational Generative Grammar, Verbs, Vocabulary, Words (Phonetic Units), Written Language] 1810, 1887, 2141, 2156, 2158, 2164, 2168, 2234, 2312, 2325, 2340, 2353, 2468, 2510, 2556, 2626, 2660, 2767, 2778, 2836, 2866, 2980, 2985, 3027, 3151, 3167, 3186, 3232, 3236
Verbal Conditioning [See Verbal Learning]
Verbal Learning [See Also Nonsense Syllable Learning, Paired Associate Learning, Serial Anticipation (Learning), Serial Learning] 1822, 1853, 1854, 1878, 1879, 1883, 1884, 1893, 2140, 3095, 3207
Verbal Meaning 1836
Verbal Reinforcement [See Also Praise] 2788, 3024, 3105, 3114
Verbalization [See Verbal Communication]
Verbs 2183
Vertebrates [See Baboons, Bats, Birds, Cats, Chickens, Chinchillas, Cichlids, Dogs, Ducks, Fishes, Frogs, Guinea Pigs, Hamsters, Lizards, Mammals, Mice, Monkeys, Pigeons, Primates (Nonhuman), Rabbits, Rats, Robins, Turtles]
Vestibular Stimulation [See Somesthetic Stimulation]
Veterans (Military) [See Military Veterans]
Videotape Instruction 2850, 2883

BRIEF SUBJECT INDEX

Videotapes 2614, 2635, 2665, 3030, 3226
 Violence 2131, 2384, 2413, 2497, 2894
 Vision [See Color Perception; Monocular Vision; Visual Discrimination; Visual Thresholds; Visual Perception; Visual Thresholds]
 Visions (Mysticism) [See Mysticism]
 Visual Cortex 1969, 1977, 1981, 1982, 1985, 2038, 2050, 2069
 Visual Discrimination 1799, 1911, 1914, 1915, 1922, 1957, 2001, 2034, 2055, 2181
 Visual Evoked Potentials 1971, 1977, 1993
 Visual Feedback 2021, 3011
 Visual Field 1801, 1985
 Visual Masking 1806
 Visual Perception [See Also Color Perception; Monocular Vision; Visual Discrimination; Visual Field; Visual Thresholds] 1797, 1799, 1801, 1802, 1806, 1807, 1880, 1914, 1915, 1971, 2052, 2156, 2181, 3026, 3076, 3215
 Visual Stimulation [See Also Illumination; Photopic Stimulation; Tachoscopic Presentation; Visual Feedback] 1753, 1784, 1807, 1852, 1874, 1960, 1969, 1974, 1976, 1978, 1979, 1982
 Visual Thresholds 2050
 Visually Handicapped [See Also Blind] 3191
 Vitamin Deficiency Disorders [See Pellagra]
 Vocabulary [See Also Synonyms] 2957, 3039, 3059, 3096, 3301
 Vocalization [See Also Animal Distress Calls; Animal Vocalizations; Subvocalization] 1887, 3207
 Vocalizations (Animal) [See Animal Vocalizations]
 Vocational Adjustment [See Occupational Adjustment]
 Vocational Aspirations [See Occupational Aspirations]
 Vocational Choice [See Occupational Choice]

Vocational Counseling [See Occupational Guidance]
 Vocational Education 2915, 3153, 3237
 Vocational Guidance [See Occupational Guidance]
 Vocational Interests [See Occupational Interests]
 Vocational Mobility [See Occupational Mobility]
 Vocational Preference [See Occupational Preference]
 Vocational Rehabilitation 2787, 2789, 2792, 2794
 Vocational School Students 3011, 3012, 3110, 3117
 Vocational Schools [See Technical Schools]
 Vocations [See Occupations]
 Volunteer Personnel 2739, 3295, 3347
 Vomit Inducing Drugs [See Emetics; Drugs]
 Voting Behavior 2290

Wages [See Salaries]
 Wakefulness 2003, 2018, 2027
 Wales 2835
 War 2396, 2573, 2728, 2737
 Warning Signal [See Signal Detection (Perception)]
 Water Deprivation 2040
 Water Intake 2025, 2091, 2124
 Wechsler Intelligence Scale (Children) 2809, 3239, 3306
 Weight (Body) [See Body Weight]
 Weight Perception 2189
 Welfare [See Welfare Services (Government)]
 Welfare Services (Government) 2878, 2902
 West German Federal Republic 1755, 2876
 White Collar Workers [See Also Accountants; Management Personnel; Middle Level Managers; Sales Personnel; Top Level Managers] 3320

White Rats [See Rats]
 Whites [See Race]
 Whips 204
 Withdrawal (Drug) [See Drug Withdrawal]
 Withdrawal Effects (Drug) [See Drug Withdrawal]
 Wives [See Also Housewives] 2900, 3266
 Word Associations 1878, 1884, 1885, 1891, 1893, 2139, 3213
 Word Blindness (Aphasia) [See Aphasia]
 Word Blindness (Dyslexia) [See Dyslexia]
 Word Deafness 2011
 Word Meaning 1807, 2011, 2012, 2351, 2823, 3105, 3309
 Words (Form Classes) [See Form Classes (Language)]
 Words (Phonetic Units) 1814, 1858, 1866, 2187, 3081, 3196
 Words (Vocabulary) [See Vocabulary]
 Work (Attitudes Toward) 3317
 Work Environments [See Working Conditions]
 Work Scheduling 2819
 Work Study Programs [See Educational Programs]
 Working Conditions [See Also Occupational Safety] 2403, 3113
 Workshops (Sheltered) [See Sheltered Workshops]
 Worship [See Religious Practices]
 Wounds [See Self-Inflicted Wounds]
 Writing (Creative) [See Literature]
 Writing (Handwriting) [See Handwriting]
 Written Language [See Also Handwriting; Initial Teaching Alphabet; Letters (Alphabet)] 2143, 2168, 3236, 3284

Young Adults 1768, 1811, 2169, 2251, 2265, 2306, 2333, 2585, 2765, 2787, 3328
 Youth (Adolescents) [See Adolescents]
 Youth (Adults) [See Young Adults]
 Youth (Children) [See Children]

AUTHOR INDEX

The Author Index is intended to be a name index only and not a person index. "Adams, P." will be listed separately from "Adams, Paul" even though the names may refer to the same person however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.

1972-74 Cumulative Indexes to Psychological Abstracts

These three-year **Indexes** contain all records published in the *Psychological Abstracts* from January 1972 through December 1974. Two kinds of indexes are available:

The **Subject Index** consolidates references to the world's literature in psychology and related disciplines that were summarized in 36 monthly issues of *Psychological Abstracts*. Index terms representing the major concepts described in this literature have been applied. Phrases describing subject matter content appear under each term, enabling the user to select those references which are relevant to their needs and interests. Entries in the index contain subject index terms, *see* and *see also* reference listings, descriptive phrases, and *PA* volume and record number (two volumes).

The **Author Index** contains references to authors who produced material that was summarized in 36 monthly issues of *Psychological Abstracts*. As many as four authors are referenced for each entry. Thus, all the publications of individual investigators who conduct programmatic research in collaboration with others can be easily identified. Primary entries in the index contain up to four author's names, title of source document, year of publication, volume and issue numbers, inclusive pagination, and *PA* volume and record numbers. Secondary authors are listed by name only, with a cross-reference to the primary author and *PA* volume and record number (one volume).

The **Cumulative Indexes** for 1972-74 utilize index terms from the new *APA Thesaurus of Psychological Index Terms*. The size of the **Indexes** remains compatible with those published previously. Pages are 10 x 14 inches,

printed on durable acid-free paper, and encased in Class A library binding.

	U.S. and other PUAS countries	Non-PUAS countries
1972-74 Cumulative Subject Index to PA (two volumes)	\$380	\$390
1972-74 Cumulative Author Index to PA (one volume)	\$235	\$245
Both Indexes for 1972-74	\$485	\$495
1969-71 Cumulative Indexes to Psychological Abstracts are also available from APA.		
1969-71 Cumulative Subject Index to PA (two volumes)	\$360	\$390
1969-71 Cumulative Author Index to PA (one volume)	\$220	\$240
Both Indexes for 1969-71	\$465	\$495

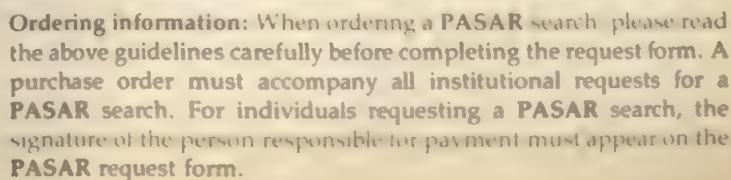

Earlier editions of the **Cumulative Indexes**, for the period 1927-1968, may be obtained by writing to: G. K. Hall and Company, 70 Lincoln Street, Boston, Massachusetts 02111. Please do not write to APA to obtain information about these editions.

Ordering information. Please send your request for the 1972-74 and 1969-71 **Indexes** accompanied by full payment or institutional purchase order to:

American Psychological Association
Publication Sales Department
1200 17th Street, N.W.
Washington, D.C. 20036

Charges for processing PASAR requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.

PASAR REQUEST FORM

Psychological Abstracts Information Service

American Psychological Association
1200 Seventeenth Street, N.W.
Washington, D.C. 20036

FOR OFFICE USE ONLY

Search Request No. _____
Search Time _____

PSYCHOLOGICAL ABSTRACTS 1976 CHANGES

Content Classification. As the result of an extensive study of the psychological literature, a new classification system for 1976 has been developed which groups the literature in a manner more useful to the reader. This classification outline, showing major and minor subject areas, has become the new Table of Contents. The January 1976 issue of *PA* describes these new classifications and their contents in the *Guide to PsycINFO*.

Dissertation Abstracts International. In 1976, *PA* will resume coverage of *Dissertation Abstracts International (DAI)*. Since coverage was suspended in mid 1973, there will be a period of catching up to insure that all material will be included in the 1975-1977 Cumulative Index and that no gaps will appear in the retrospective data base. The relevant dissertations for the last half of 1973, all of 1974 and 75 will be cited in the 1976 issues of *PA*. In 1977, all relevant dissertations from 1976 and 77 will be covered. The 1978 issues will include *DAI* as one of the regularly scanned journals on a current basis.

GUIDE TO PsycINFO

The *Guide* describes innovations in *Psychological Abstracts (PA)* as well as derivative products and services designed to facilitate selective access to the world's scientific literature in psychology and related disciplines. Copies of the *Guide* are available upon request from:

PsycINFO
American Psychological Association
1200 17th Street, N.W.
Washington, D.C. 20036

Psychological Abstracts (PA) provides nonevaluative summaries of the world's literature in psychology and related disciplines. Over 850 journals, technical reports, monographs and other scientific documents provide material for coverage in *PA*. About 20% of the records published in *PA* are bibliographic citations or annotations which are used to cover books, articles peripherally relevant to psychology, or articles that can be represented adequately in approximately 30-50 words.

Issue. The monthly issues contain abstracts listed under 16 major classification categories, with some categories having subsections, as shown in the Table of Contents. Under each classification heading, the abstracts are arranged alphabetically by first author. Abstracts are numbered consecutively in the two volumes produced each year.

Indexes. An author and brief subject index appear in the issues. An expanded and integrated Volume Index is published every six months. Three-year cumulative indexes are also available.

PsycINFO. *PA* records published since 1967 are now on machine readable tapes which provide the basis for automated search and retrieval services known as Psychological Abstracts Information Services (PsycINFO). For more information on these products, uses, and costs write to PsycINFO, American Psychological Association, 1200 Seventeenth St., N.W., Washington, D.C. 20036.

Correspondence on copyright matters should be directed to the permissions office, on back issue sales to the order department, and on subscriptions and address changes to Anne Redman, Subscription Manager. All correspondence should be addressed to the American Psychological Association, 1200 Seventeenth St., N.W., Washington, D.C. 20036.

Address changes must reach the Subscription Office, APA, 30 days prior to the actual change of address. Copies undelivered because of address change will not be replaced; subscribers should notify the post office that they will guarantee second-class forwarding postage. Other claims for undelivered copies must be made within 4 months of publication. Address your claims to Subscription Manager, APA.

Subscriptions are available on a calendar-year basis only (January through December). Published monthly in two volumes (January through June, and July through December), each volume contains approximately 15,000 abstract records. Volume Indexes are published twice a year under separate cover. Subscription price including Indexes per year is \$220 domestic, \$230 foreign. To subscribe, write to Subscription Manager, APA.

KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

JOURNAL ARTICLE ABSTRACT

¹1271. ²Conger, Anthony L. & Coie, John D. (Duke U) ⁴Who's crazy in Manhattan: A reexamination of "Treatment of psychological disorders among urban children." ³*Journal of Consulting & Clinical Psychology*, 1975(Apr), Vol 43(2), 179-182.—⁶Reanalyzed data reported by T. S. Langner et al ⁷(see PA, Vol. 52:8150) on the prevalence of psychological disturbances in children from welfare and cross-section homes. Results indicate that the data show no meaningful differences in means or skew and a paradoxical greater heterogeneity among welfare children. Some of the difference in variance is clearly attributable to the differential reliability of final scores, and perhaps the remaining difference is due to between-rater differences. Unless other factors were operating, 2 possible conclusions are tenable: Either welfare children manifest both more health and more disturbance than cross-section children or there are no differences in disorder between the populations. A 3rd conclusion is also offered: The populations do actually differ, but the manner in which the disturbance was viewed, rated, and compared necessarily obscured any differences.⁸ (15 ref.)—¹⁰*Journal Abstract*.

- 1—Record number.
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author/editor only.
- 4—Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5—Primary publication title and bibliographic data.
- 6—Text of abstract.
- 7—Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8—Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9—Number of references is included when there are 15 or more listed.
- 10—Abstract source.

BOOK CITATION

¹1703. ²Sugar, Max (Ed). (Louisiana State U, Medical School, New Orleans) ³The adolescent in group and family therapy. New York, NY: Brunner/Mazel, 1975. xvii, 10286 p. \$13.50.

- 1—Record number.
- 2—Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Designation of editor.
- 4—Affiliation of first-named author/editor only.
- 5—Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6—Place of publication.
- 7—Publisher.
- 8—Year of publication.
- 9—Prepagination.
- 10—Total pagination.
- 11—Price.
- 12—Annotation occasionally follows.

BOOK CHAPTER CITATION

¹1641. ²Berkovitz, Irving H. & Sugar, Max. (U California, Los Angeles) ³Indications and contraindications for adolescent group psychotherapy. In M. Sugar (Ed), *The adolescent in group and family therapy*. New York, NY: Brunner/Mazel, 1975. xvii, 286 p. \$13.50

- 1—Record number.
- 2—Author(s) of cited chapter. As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3—Affiliation of first-named author only.
- 4—Chapter title.
- 5—Referral to the whole book and its bibliographic data.

CONTENT CLASSIFICATION: PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

ABBREVIATIONS: In addition to commonly understood abbreviations* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

CA	= chronological age
CNS	= central nervous system
CR	= conditioned response
CS	= conditioned stimulus
DRL	= differential reinforcement of low rates (of responding)
E	= experimenter
ECS	= electroconvulsive shock
EKG	= electrocardiogram (graph)
EMG	= electromyogram (graph)
EPPS	= Edwards Personal Preference Schedule
Exp	= experiment
FI	= fixed interval (reinforcement)
FR	= fixed ratio (reinforcement)
GPA	= grade point average
GSR	= galvanic skin response
ip	= intraperitoneal (ly) (injections)
iv	= intravenous (ly) (injections)
MA	= mental age
MAO	= monoamine oxidase
MMPI	= Minnesota Multiphasic Personality Inventory
NREM	= nonrapid eye movement
REM	= rapid eye movement
ROTC	= Reserve Officer's Training Corps
RT	= reaction time
S	= subject
SVIB	= Strong Vocational Interest Blank
TAT	= Thematic Apperception Test
UCR	= unconditioned response
UCS	= unconditioned stimulus
US	= United States of America
USSR	= Union of Soviet Socialist Republics
VI	= variable interval (reinforcement)
VR	= variable ratio (reinforcement)
WAIS	= Wechsler Adult Intelligence Scale
WISC	= Wechsler Intelligence Scale for Children
16 PF	= Sixteen Personality Factor Questionnaire

Computer languages and computer names will also be used without definition, e.g., ALGOL, COBOL, FORTRAN, IBM 360.

Language abbreviations used after translated titles are

Afri	= Afrikaans	Iran	= Iranian
Aibe	= Albanian	Ital	= Italian
Arab	= Arabic	Japn	= Japanese
Bulg	= Bulgarian	Lith	= Lithuanian
Chin	= Chinese	Norg	= Norwegian
Czec	= Czech	Polh	= Polish
Danh	= Danish	Port	= Portuguese
Duth	= Dutch	Romn	= Romanian
Finn	= Finnish	Russ	= Russian
Flem	= Flemish	Slov	= Slovene
Fren	= French	Slvak	= Slovak
Geor	= Georgian	Span	= Spanish
Germ	= German	Sscr	= Serbo-Croatian
Grek	= Greek	Swed	= Swedish
Hebr	= Hebrew	Turk	= Turkish
Hung	= Hungarian	Ukrn	= Ukrainian
		Yugo	= Yugoslavian

PSYCHOLOGICAL ABSTRACTS

Volume 55

March 1976

Number 3

GENERAL PSYCHOLOGY

3410. **Coutts, Larry M. & Schneider, Frank W.** (U Windsor, Canada) **Recruitment of experimental subjects.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 142.—Reports results of a study concerned with the influence of S's sex and E's sex on the rate of volunteering for and, particularly, the rate of participation in an experiment. It was found that males were more likely to volunteer when recruited by a male than by a female E.

3411. **Snizek, William E.** **The relationship between theory and research: A study in the sociology of sociology.** *Sociological Quarterly*, 1975(Sum), Vol 16(3), 415-428.—Examined data concerning the theoretical orientation and methodological procedures employed by the authors of 1,434 articles (in 5 substantive areas) which have appeared in 9 major sociological journals during 1950-1970. Data reveal the presence of a strong affinity between the utilization of a realist theoretical perspective, centering upon the study of group properties, and the employment of less empirical research techniques. Conversely, those authors who used a nominalist theoretical approach, and hence those focusing upon individual properties, used more empirical techniques and procedures in their research. Further analysis of the relationship between the theoretical and methodological orientations utilized by the authors surveyed appears to indicate some tendency for one's mode of data analysis to be as much a reason for, as a function of, one's theoretical perspective. (37 ref) —*Journal abstract.*

Parapsychology

3412. **Eisenbud, Jule.** **Evolution and psi.** *Journal of the American Society for Psychical Research*, 1976(Jan), Vol 70(1), 35-53.—Discusses the possible role of psi in evolution. Several biologists have speculated that "if psi didn't exist, something like it might have to be invented to account for still outstanding puzzles in the field." The questions considered include the following: Is there an evolutionary factor beyond selection and mutation, and if so, what is it? Can genetic material be acted upon directly by psi? Could psi communication exist among members of different species and thereby play a role in selection? What is the basis for the overall interrelatedness of all the systems of nature? And finally, what might be the evolutionary role of precognition? (52 ref) *R. A. White.*

3413. **Pratt, J. G. & Stevenson, Ian.** (U Virginia) **An instance of possible metal-bending indirectly related to Uri Geller.** *Journal of the American Society for Psychical*

Research, 1976(Jan), Vol 70(1), 79-93.—One side effect of Uri Geller's reported metal-bending activities has been the discovery of a number of other persons said to be capable of bending metal objects such as knives and spoons by stroking them gently or only wishing them to bend. Many such accounts have appeared in newspapers and in books directed to the general public, but a search for detailed reports of incidents of metal-bending (and associated phenomena, such as unexpected starting of long-stopped watches) in the scientific literature on parapsychology has revealed only 2 published accounts. An instance of the "Geller effect" is described in which a knife appeared to bend paranormally. It is hoped that this presentation will lead other scientists to publish detailed reports of similar incidents which they may witness.—*Journal abstract.*

3414. **Stanford, Rex G. & Stio, Angela.** (St John's U) **A study of associated mediation in psi-mediated instrumental response.** *Journal of the American Society for Psychical Research*, 1976(Jan), Vol 70(1), 55-64.—Examined extrasensory (ES) response to a need by testing (a) the "strength-need" hypothesis (response to a need is proportional to the strength of the need) and (b) the "associative-mediation" hypothesis (response occurs through facilitation or triggering of ready or available responses). The reaction time (RT) of college-age males taking a free association test was measured. The nonvolitional ES task required the S to produce his shortest RT (facilitation contingency) or his longest (inhibition contingency) in response to a randomly chosen key word of a list. He was mildly rewarded or punished according to whether he did or did not produce the required RT. Ss did not know that their RT on one of the words would have consequences; it was assumed that they would unconsciously use psi in the service of their need, of which they were unaware, to choose the correct RT. The associative-mediation hypothesis was confirmed; the strength-need hypothesis was not, at least under these experimental conditions.—*Journal abstract.*

3415. **Stevenson, Ian.** (U Virginia) **A preliminary report of a new case of responsive xenoglossy: The case of Gretchen.** *Journal of the American Society for Psychical Research*, 1976(Jan), Vol 70(1), 65-77.—Describes a case of xenoglossy, or the ability to speak an unknown language (in this case German) intelligibly. The xenoglossy was manifested during hypnosis in which a German-speaking trance personality was revealed, calling itself "Gretchen." A content analysis was made of the words used and the efforts to discover whether or not the S could have picked up a speaking knowledge of German by normal, albeit unconscious, or forgotten, means is described. However, normal explanations of the case appear to be ruled out. Several "paranormal"

hypotheses to account for the described phenomena are discussed.—R. A. White.

History & Philosophies & Theories

3416. Anderson, Richard J. (U Florida) **The untranslated content of Wundt's *Grundzüge der physiologischen Psychologie*.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 381-386.—Notes that limited translation into English has entailed loss of awareness of the nature and scope of W. Wundt's system of psychology. There is no English translation of the original edition (1873-1874) of Wundt's *Grundzüge der Physiologischen Psychologie* and E. B. Titchener's translation of the 5th edition (1902-1903) includes only the 1st of 3 volumes. Titchener translated what was vital to his system of structuralism.—C. M. Franks.

3417. Bakan, David. (York U, Toronto, Canada) **The authenticity of the Freud Memorial Collection.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 365-367.—Questions the authenticity of the Freud Memorial Collection housed in the Library of the New York Psychiatric Institute, which purports to be part of Freud's personal library.—C. M. Franks.

3418. Bever, Thomas G. & Mehler, Jacques. (Columbia U) **Reason and un-reason.** *International Journal of Cognitive Psychology*, 1974-1975, Vol 3(1), 83-84. Considers the sociopolitical stance of A. R. Jensen's research on IQ. The logical distinctions presupposed by his research program are considered: that there are "races," that there is a society-free capacity called "intelligence," and that IQ measures it. These are necessary prerequisites for his conclusion that one race is more intelligent than another, thus "presupposing" racism. The importance of developing a theory of the relation between behavioral science and its social context is stressed.—R. Tomasko.

3419. Birley, J. L. (Bethlem Royal & Maudsley Hosp, England) **The history of psychiatry as the history of an art.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 393-400. Analyzes the development of psychiatric theories in terms of the problems faced by various types of artists (e.g., the problem of transforming data, by a process of symbolic transformation, into what appears to be truth). Reasons for the confused mixture of theories which abound in contemporary psychiatry, implications for psychiatric education, and the concept of theories as "art forms" are examined.

3420. Buss, Allan R. (U Alberta, Ctr for Advanced Study in Theoretical Psychology, Edmonton, Canada) **Psychology's future development as predicted from generation theory.** *Human Development*, 1974, Vol 17(6), 453-459.—Predicts that the future development of psychology as an academic discipline will become severely retarded. This general conclusion is arrived at by considering present socioeconomic conditions affecting the discipline of psychology and the long-term consequences of such conditions in light of K. Mannheim's (1952) theory of generations. Of particular importance in this argument is the idea that in order to have a living psychology (i.e., a psychology that is developing and is responsive and adaptive to external and internal events), a constant flow into academia of

new generations of psychologists is required. (18 ref) —*Journal abstract.*

3421. Collins, Allan M. & Loftus, Elizabeth F. (Bolt Beranek & Newman Inc, Cambridge, MA) **A spreading-activation theory of semantic processing.** *Psychological Review*, 1975(Nov), Vol 82(6), 407-428.—Presents a spreading-activation theory of human semantic processing, which can be applied to a wide range of recent experimental results. The theory is based on M. R. Quillian's (1967) theory of semantic memory search and semantic preparation, or priming. In conjunction with this, several misconceptions concerning Quillian's theory are discussed. A number of additional assumptions are proposed for his theory to apply it to recent experiments. The present paper shows how the extended theory can account for results of several production experiments by E. F. Loftus, J. F. Juola and R. C. Atkinson's (1971) multiple-category experiment, C. Conrad's (1972) sentence-verification experiments, and several categorization experiments on the effect of semantic relatedness and typicality by K. J. Holyoak and A. L. Glass (1975), L. J. Rips et al (1973), and E. Rosch (1973). The paper also provides a critique of the Rips et al model for categorization judgments. (44 ref)—*Journal abstract.*

3422. Cullen, C. N. (Bryn-Y-Neuadd Hosp, Llanfairfechan, Wales) **"Behaviourism and Education": A reply.** *AEP (Association of Educational Psychologists) Journal*, 1975(Sum), Vol 3(9), 35-38.—Questions the relevance of J. C. Quicke's (see PA, Vol 54:8247) criticism of radical behaviorism, specifically rebutting 2 points: that behaviorism is both mechanistic and reductionistic, and that it is not humanistic.—J. L. Zimmerman.

3423. Evans, Rand B. (U New Hampshire) **The origins of Titchener's doctrine of meaning.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 334-341.—The traditional view that E. B. Titchener developed the doctrine of meaning to oppose the work of the Würzburg School on imageless thought is rejected in favor of the theory of a more gradual development during the 1890s which eventually made it impossible for Titchener to accept the Würzburg findings.—C. M. Franks.

3424. Friedman, Robert M. (Jewish Board of Guardians, Brooklyn, NY) **The child psychology of Maurice Merleau-Ponty.** *Psychoanalytic Review*, 1975(Fal), Vol 62(3), 469-480.—Discusses M. Merleau-Ponty's Sorbonne lectures on child psychology and philosophy. The lectures are grouped under the headings the child's perceptual world, social development, language development, and the psychoanalytic theory of the child. (19 ref)

3425. Green, Robert L. (Michigan State U) **The social responsibility of psychology.** *The Black Scholar*, 1975(Jul-Aug), Vol 6(10), 32-35.—Uses statistics and outlines of social problems to illustrate areas of inequality and injustice in order that psychology, psychiatry, and sociology can work toward improving the quality of life. Scholarly neutrality is viewed as both impossible and undesirable. An environmental approach to psychological stress is suggested, and psychologists are encouraged to become more involved in American politics. Implications for psychologist training programs are noted.—R. Tomasko.

3426. Hanmer, Patricia M. (Hartford Seminary Foundation) **Wholemaking in man: An interpretation of R. D. Laing.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 393.

3427. Heims, Steve. **Encounter of behavioral sciences with new machine-organism analogies in the 1940's.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 368-373.—The Macy Conferences on Cybernetics (1946-1953), an interdisciplinary group whose members have little in common, are reviewed in terms of the group's ability to survive for 7 yrs, given its distinguished but varied membership. Special attention is given to the influence of W. Koehler and his apparently conflicting Gestalt viewpoint.—C. M. Franks.

3428. Hensley, Michael L. (United States International U) **Holism as expressed in the philosophy of Jan C. Smuts and the psychology of Abraham H. Maslow.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1724-1725.

3429. Kanekar, Suresh. (U Bombay, India) **Attitudes in behavior theory.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 72-82.—Several behavioristic analyses of the concept of attitude are critically discussed, and empirical evidence in support of the classical conditioning approach to attitudes is presented. An attitude is considered to represent a habit between an attitudinal stimulus and an attitudinal response, the latter being an internal emotional response. Extensions of the classical conditioning approach are offered, along with some speculations regarding the nature of the attitudinal response. (49 ref)—*Journal abstract*.

3430. Koteskey, Ronald L. (Asbury Coll) **An integration of statistics and Christianity.** *Journal of Psychology & Theology*, 1975(Sum), Vol 3(3), 195-201.—Argues that the Christian world-view has implications for statistics at the philosophical level as well as the theoretical and applied levels. At the philosophical level, statistics can be regarded as reflecting reality, man's ignorance, or both ignorance and reality. At the theoretical level the Christian viewpoint influences the statistics used in teaching. Finally, at the applied level, Christian faith must be reflected in our use of statistics in testing, counseling, and grading. (19 ref)—*Journal abstract*.

3431. Lewis, Elaine F. (California School of Professional Psychology, Los Angeles) **The psychology of the ego—East and West.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 875-876.

3432. Loreto, D. & Tonoli, C. (Hosp Psichiatrico Provinciale, Como, Italy) **[Behavior theory and its clinical applications.]** (Ital) *Neuropsychiatria*, 1973(Jan-Jun), Vol 29(1-2), 1-26.—Reviews the basic concepts of J. Dollard and N. E. Miller's S-R theory of learning (drive, cue, response, reinforcement) and its contribution to the understanding of the dynamic structure and development of personality. 4 child-rearing situations (nutrition, cleanliness training, sex education, and control of aggression) are examined in view of their importance in the potential development of adult psychopathology. Behavioristic interpretations of conflict, the unconscious, defense mechanisms, some emotional disturbances, and psychotherapy are discussed. Experimental evidence supporting the theory is present-

ed together with some criticisms. (38 ref) (French & German summaries)—*English summary*.

3433. Mawhinney, Thomas C. (Indiana U, Graduate School of Business) **Operant terms and concepts in the description of individual work behavior: Some problems of interpretation, application, and evaluation.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 704-712.—Problems of interpretation, application, and evaluation of operant terms, concepts, and principles are examined by reference to examples of the problems in the extant literature. The complex terms and concepts commonly used in the operant paradigm rarely appear in the industrial-organizational literature, resulting in both conceptual and operational problems with the application of other operant terms, concepts, and principles. The absence of control or comparison groups and use of between-Ss research designs in tests of operant principles are observed to be potential sources of overstatement and understatement of the value of the principles, respectively. Recognition of these problems is considered the 1st step in their solution. (48 ref)—*Journal abstract*.

3434. Mazur, James E. (Harvard U) **The matching law and quantifications related to Premack's principle.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 374-386.—Premack's differential-probability principle states that more probable responses will reinforce less probable responses, and less probable responses will punish more probable responses. The present experiment demonstrates that equations derived from R. J. Herrnstein's matching law successfully generate quantitative predictions related to this principle. The duration 5 male Lashley rats spent running in a wheel and drinking a sucrose solution were recorded when both were continuously available. These durations were used to predict the durations of the behaviors in conditions where the proportion of drinking time relative to running time was controlled. The obtained durations approximated the predictions but on the average were slightly longer than predicted. The duration of running increased in some conditions, and for 4 Ss drinking increased in other conditions. Results indicate that the matching law can be applied to situations where Premack's principle has provided qualitative predictions.—*Journal abstract*.

3435. Mendelsohn, Mark B. (George Mason U) **Nonautonomous free man.** *Behaviorism*, 1975(Spr), Vol 3(1), 117-119.—Offers the concept of nonautonomous free man as a replacement for consequence-uncontrolled man. Nonautonomous free man construes events and arranges the contingencies influencing his behavior.—S. M. Levin.

3436. Michael, Jack. (Western Michigan U) **Positive and negative reinforcement, a distinction that is no longer necessary; or a better way to talk about bad things.** *Behaviorism*, 1975(Spr), Vol 3(1), 33-44.—Describes the historical development of the distinction between positive and negative reinforcement. Difficulties are noted with the current practice of defining positive reinforcement as a behavior-strengthening presentation of a stimulus and negative reinforcement as a behavior-strengthening removal. These problems include the opposite implications of negative reinforcement to the layperson and the difficulties in discriminating between

stimulus presentation and removal. A need is seen to distinguish between "good" and "bad" environmental events. The suggested solution is to refer to the positive, or behavior-strengthening things as reinforcers and reinforcement, and the negative, or behavior-weakening things as punishers and punishment, and to dispense with the distinction between positive and negative reinforcement.—S. M. Levin.

3437. Mixon, Don. (U Massachusetts, Boston) **Away with positive and negative reinforcement.** *Behaviorism*, 1975(Spr), Vol 3(1), 45-47.—Points out that the behavior-strengthening meaning of negative reinforcement is at variance with its negative or aversive connotations in ordinary English. Lay people as well as many professional psychologists commonly confuse "punishment" and "negative reinforcement." The proposal is made to substitute the single term "reinforcement" for "positive reinforcement" and "negative reinforcement."—S. M. Levin.

3438. Nandy, Ashis. (Ctr for the Study of Developing Societies, New Delhi, India) **New responsibilities in psychology: Experience, values, and alternatives.** *Indian Journal of Psychology*, 1974, Vol 49(4), 337-342.—Reviews the works of A. Maslow, H. C. Kelman, and several contemporary British social scientists to indicate that psychology is moving from a positivist and pragmatic orientation toward a more open and pluralistic culture of science.

3439. Nelson, R. J. (Case Western Reserve U) **Behaviorism, finite automata, and stimulus theory.** *Theory & Decision*, 1975(Aug), Vol 6(3), 249-267.—Argues that certain stimulus-response learning models which are adequate to represent finite automata (acceptors) are not adequate to represent noninitial state input-output automata (transducers). This circumstance suggests the question whether or not the behavior of animals, if satisfactorily modeled by automata, is predictive. It is argued in partial answer that there are automata which can be explained in the sense that their transition and output functions can be described (roughly, Hempel-type covering law explanation), while their behaviors are in principle not predictable short of possession of their complete histories or of information concerning present internal states by indirect observation.—*Journal abstract*.

3440. Pope, Whitney. **Durkheim as a functionalist.** *Sociological Quarterly*, 1975(Sum), Vol 16(3), 361-379.—Argues that functionalism is basic to E. Durkheim's sociology. Like other functionalists, he focused on the problem of order and the positive effects of social institutions, explaining their existence in terms of their functionally necessary contributions. The most distinctive, and yet widely ignored, aspect of his approach is the implicit argument that as a powerful, self-conscious entity controlling the behavior of its individual members, society can perpetuate the social conditions of its own existence. It is concluded that many of the characteristic strengths and weaknesses of Durkheim's sociological theory may be traced to his functionalism. (49 ref)—*Journal abstract*.

3441. Sardello, Robert J. (U Dallas) **A phenomenological approach to development: The contributions of Maurice Merleau-Ponty.** *Human Development*, 1974, Vol

17(6), 401-423.—Attempts to clarify the importance of the relation between psychology and philosophy for the understanding of child development. The writings in child development of the philosopher-psychologist M. Merleau-Ponty are considered in detail as examples of the fruitfulness of such a relationship. A critical stance is adopted toward the presuppositions of a strictly empirical approach to human development. These presuppositions are brought to light, not necessarily to reject them, but to better understand that empirical and experimental approaches to child development contain an implicit view of human consciousness and that this view guides traditional developmental psychology. The positive contributions of Merleau-Ponty's phenomenological approach to developmental psychology are examined in the areas of perception, language acquisition, and the child's relations with others.—*Journal abstract*.

3442. Schwebel, Milton. (Rutgers State U, Graduate School of Education, New Brunswick) **The inevitability of ideology in psychological theory.** *International Journal of Mental Health*, 1974-75(Win), Vol 3(4), 4-26.—Argues that qualified scientists have often in the past upheld group differences in scholastic achievement that are inherent, genetic, or due to social classification. Although earlier contentions about the inferiority of certain groups have not been borne out, theories about the inferior intelligence of groups are inevitable. They will persist because they are the product of an ideology that helps maintain class, race, and sex differences in the distribution of resources, and are as durable as that ideology. Only biased theories are formed which rationalize the existing inequalities in education. Recent efforts are a perpetuation of ideological thinking in psychology, designed to resist the newest waves of demands for better education for more children. To reduce dependence upon ideological thinking it is considered necessary to understand the reasons for its inevitability. (35 ref)—A. H. Alawi.

3443. Spero, Moshe H. **Anticipations of dream psychology in the Talmud.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 374-380.—Various statements in the Babylonian and Palestinian Talmud about dreams, their nature, validity, and analysis are discussed in terms of modern theories of dream psychology. Contrary to the unsystematic categorizations of earlier writers on the topic, these statements, when carefully examined, indicate advanced concepts of dream study and interpretation.—C. M. Franks.

3444. Suppes, Patrick. (Stanford U) **From behaviorism to neobehaviorism.** *Theory & Decision*, 1975(Aug), Vol 6(3), 269-285.—Cites earlier definitions of behaviorism and proposes an informal definition of "neo-behaviorism" which has as its basic issue the concept of reinforcement. Sampling, conditioning, and response axioms are set forth, and an improved version of the author's (1969) theorem of determinate reinforcement is presented. Learning theory is extended to arbitrary partial recursive functions, using the concept of unlimited register machine, and theoretical difficulties inherent in this extension are discussed. It is noted that organizing the hierarchy of tasks to be mastered by the learner is a traditional problem in formulating curricula, and it is stressed that the internal hierarchy is as much subject to

control and variation as the external. Because the complex psychological aspects of human activities cannot be predicted from knowledge of the mechanism of the physical hardware of the brain, it is suggested that the name of the fundamental psychological study be changed from "behaviorism" to "neobehaviorism."—*B. McLean.*

3445. Theophanous, Andrew C. (Monash U, Clayton, Australia) **In defense of self-determination: A critique of B. F. Skinner.** *Behaviorism*, 1975(Spr), Vol 3(1), 97-115.—Criticizes Skinnerian emphasis on determination by environmental consequences and offers an approach and set of guidelines for behavior modifiers designed to preserve the notion of self-determination.—*S. M. Levin.*

3446. Weiss, Fred T. (U California, Santa Cruz) **Images and false consciousness.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1266.

3447. Weisz, George. (U Paris VII, Centre des Etudes Comparatives des Systemes d'Enseignement Supérieur, France) **Scientists and sectarians: The case of psychoanalysis.** *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 350-364.—Notes that early psychoanalysts often behaved more like followers of a religious sect than like scientists. Features and events in the history of the psychoanalytic movement which represent interactions and conflicts between sectarian characteristics, the norms of science, and the institutional imperatives of scientific life are analyzed. It is suggested that professional success in the US destroyed the passionate relationships and utopian zeal which animated the school at first, and may have signaled the disappearance of intellectual initiative and scientific creativity.—*C. M. Franks.*

3448. White, William H. (U Pittsburgh) **The twentieth-century cultural climate as a potential factor in the disintegration of man: A consideration of the modern concept of contingency and a theistic alternative in terms of life-integrative potential and implications for counseling.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3076.

3449. Wiegand, Jeffery W. (United States International U) **Toward a transcendental psychology: An heuristic study.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1736-1737.

3451. Zuriff, G. E. (Wheaton Coll, MA) **Where is the agent in behavior?** *Behaviorism*, 1975(Spr), Vol 3(1), 1-21.—Contrasts behavior viewed as automatic conditioned movements and as actions brought about by an agent. As a result of their commitment to scientific objectivity, major behaviorists claim to use an action-neutral approach in which responses are seen as movements. However, behaviors are frequently described as actions. The question is raised whether the notion of agency can be included in a strictly behavioristic approach. The proposed answer is that certain relationships between a movement and its context mark it as an action. These include sensitivity to antecedents and consequences, and dependence on other bodily

events and dispositions established in the past. (39 ref)
S. M. Levin.

Research Methods & Apparatus & Computer Applications

3452. Alluisi, Earl A. (Old Dominion U) **Optimum uses of psychobiological, sensorimotor, and performance measurement strategies.** *Human Factors*, 1975(Aug), Vol 17(4), 309-320.—The selection of a criterion, index, or output to measure when an experiment is planned will influence not only the conduct of the study, but also the findings and generalizations that can be made on the basis of the results. Guidelines for making such selections among psychobiological, sensorimotor, and performance measurement domains are presented, based on the summary findings of research in 4 areas: the behavioral effects of (a) occupational exposure to inorganic lead, (b) exposure to carbon monoxide, (c) sleep loss, and (d) infectious disease. 3 dimensions that must be considered in order to optimize the selection are the purpose, immediate and distal, of the specific study; the degree of specificity vs generality of the organismic changes involved; and the desired area(s) of generalization of the findings of the study. (26 ref)—*Journal abstract.*

3453. Bolz, Charles R. (U Illinois, Urbana-Champaign) **The development of cluster analytic theory: An experimental comparison of two models.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 846.

3454. Clofu, I. (Inst de Psihologie, Bucharest, Hungary) **Audiospectral analysis in lie detection.** *Archiv für Psychologie*, 1974, Vol 126(2-4), 170-180.—Describes the methods used in an exploratory psychophysiology study; these consisted of (a) processing by an audiofrequency analyzer of verbal responses and of the sound aspect of the EKG, and (b) a new method of using these indices, with electric shock as a punishment for fake answers in a 1st experimental phase; by generalization, the emotion appears conditioned to any further lie. Results point to quantitative spectral response values which clearly differ from the quantitative point of view under lie and truth circumstances. Theoretical and practical implications for research are discussed. (German summary) (25 ref)—*Journal summary.*

3455. Gadlin, Howard & Ingle, Grant. (U Massachusetts, Amherst) **Through the one-way mirror: The limits of experimental self-reflection.** *American Psychologist*, 1975(Oct), Vol 30(10), 1003-1009.—Discusses questions about the validity of the knowledge that comes from experimentation. The uncertainty of some psychologists about the external validity of the results of laboratory experiments and the impact of the E-S relationship on the results are considered. The suitability of the experimental method to evaluate itself is also questioned. The shaping of experimental methods to fit the phenomena, and the development of a method in which both researcher and participants mutually explore psychological phenomena, are encouraged. (36 ref)—*R. Tomasko.*

3456. Getty, Richard E. (U Missouri, Kansas City) **The speculative instruments concept and social science methodology.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1256.

3457. Goldiamond, Israel. (U Chicago) **Alternative sets as a framework for behavioral formulations and research.** *Behaviorism*, 1975(Spring), Vol 3(1), 49-86.—Contrasts the present unilinear formulation of behavior with a proposed formulation emphasizing alternative sets. The unilinear approach describes target behaviors in terms of the contingencies into which they enter. The proposed formulation requires description not only of relations between behaviors and environmental events but also of alternative sets of behavior-environment relations. The suggested framework emphasizes the development of constructional theory and procedures as opposed to the pathological theory and eliminative procedures which currently characterize many applied settings. Therapeutic efforts of a constructional nature would seek to program alternate behavioral repertoires designed to achieve consequences which are currently achieved by maladaptive means.—S. M. Levin.

3458. Hartley, L. & Graham, P. (U Otago, Dunedin, New Zealand) **Computer programmes for signal detection theory.** *New Zealand Psychologist*, 1975(Apr), Vol 4(1), 23-24.—Describes a computer program that is designed to perform the normal analysis of signal detection data as described by D. R. Grey and B. J. Morgan (see PA, Vol 48:6072). The program provides a maximum-likelihood solution to the computation of the parameters of data collected by the ratings methods of signal detection.

3459. Isaksson, Anders & Wennberg, Arne. (Royal Inst of Technology, Karolinska sjukhuset, Stockholm, Sweden) **An EEG simulator: A means of objective clinical interpretation of EEG.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 313-320.—L. H. Zetterberg and K. Ahlin described in 1975 an analog simulator, based on a previously developed model theory, which could reproduce practically all types of stationary, as well as a number of non-stationary, EEG signals. This simulator is used to demonstrate the relation between the properties of a signal in the spectral domain and in the time domain. Attempts are made to determine what the EEG signal corresponding to the frequency spectrum looks like if one starts from this spectrum. Attention is drawn to the usefulness of the simulator in connection with training and as an instrument for testing computer and other systems of EEG analysis.—*Journal summary.*

3460. Jacobs, Keith W. (U Southern Mississippi) **Dimensions of research: An expansion and clarification.** *Southern Journal of Educational Research*, 1975(Fal), Vol 9(4), 203-208. Outlines a multidimensional model of psychological research. The 7 dimensions of the model are normative exploratory, ahistorical-historical, naturalistic manipulative, atheoretical theoretical, single S group, animal human, and part whole. It is suggested that these dimensions can be used to characterize psychological research and that researchers can profit from looking at their science as a whole rather than as one type of research. Comparisons of these models to similar ones proposed by B. R. McCandless (1967) and H. W. Reese and L. P. Lipsitt (1970) are presented, and the concept of "non-independence" is examined in relation to each of the 7 dimensions. *Journal abstract.*

3461. Jones, Homer W. (Oregon State U) **An investigation of the effects of feedback on variability and central tendency of group opinion while employing the Delphi Technique.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2361.

3462. Kehoe, Jerard F. & Cliff, Norman. (U Southern California) **INTERORD: A computer-interactive FORTRAN IV program for developing simple orders.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 675-678.

3463. Mahoney, Robert & Druckman, Daniel. (Ctr of Naval Analysis, Arlington, VA) **Simulation, experimentation, and context: Dimensions of design and inference.** *Simulation & Games*, 1975(Sep), Vol 6(3), 235-270.—Examines the trend among simulation designers toward the construction of models of the middle range. The models are designed to resolve the tension between the "contextual particularity" of events and the apparent order and organization of events in the form of general laws and theory.—D. E. Anderson.

3464. Mehta, Prayag & Mohta, Nirmala. (U Udaipur, India) **Achievement motive research in India.** *Indian Journal of Psychology*, 1974, Vol 49(4), 320-336.—Reviews the literature, focusing on the development of methodology, the level of need achievement and its relation to performance, the social implications of research results, and attempts designed to develop motivation. Achievement motivation is related to intelligence, level of aspiration, and personality variables. Implications for the psychological training of teachers and students are noted. (3 p ref)—R. Tomasko.

3465. Meyers, William R. (U Cincinnati) **The politics of evaluation research: The Peace Corps.** *Journal of Applied Behavioral Science*, 1975(Jul-Sep), Vol 11(3), 261-280. Discusses the major political problems evaluation research must solve if it is to be effective in an innovative agency, using Peace Corps annals as illustrations. In solving these problems, the consultative and entrepreneurial role of the "inside" researcher, the role of the "outside" researcher, the relative merits and demerits of contracts and grants for evaluation, and the constructive impact careful research can have on an innovative agency's program and mission are examined. (30 ref)

3466. Midlarsky, Manus & Midlarsky, Elizabeth. (U Colorado) **Analysis of research efficiency: Costs and information gain.** *Psychological Reports*, 1975(Oct), Vol 37(2), 607-617.—Provides a method for the examination of research efficiency in terms of costs to the Ss and information gain for the researcher. The basic problem of maximizing the differentiations among Ss on a dependent variable is equivalent to the problem of maximizing information gain for a given cost in behavioral science research procedures. The distribution resulting from this maximization process, under certain circumstances, also minimizes 2 cost quantities of interest in such procedures, the average cost per S and the average cost per unit of information. 2 data sets are examined to illustrate the use of this criterion of research efficiency. (16 ref)—*Journal abstract*

3467. Morris, John D. (U Florida, Rehabilitation Research Inst) **A computer program to create a population with any desired centroid and covariance matrix.** *Educational & Psychological Measurement*,

1975(Aut), Vol 35(3), 707-710.—Presents a program written in FORTRAN IV which will create a population of desired size with marginally normal score vectors manifesting any desired centroid and covariance matrix. Uses and documentation are provided.

3468. Reynolds, Thomas J. & Cliff, Norman. (U Southern California) **IRIS: A computer-interactive APL program for recovering simple orders.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 671-674.—Describes a computer program, the objective of which is to obtain an individual's simple ordering of a set of stimuli in as few paired comparison preference judgments as possible.

3469. Rezek, Milan & Havlicek, Victor. (U Manitoba, Winnipeg, Canada) **A chronic intracerebral cannula.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 263-264.—Describes the preparation of a chronic intracerebral cannula from disposable regular and dental needles. The arrangement enables one to perform the infusions of experimental substances by a remote control in unres-trained, freely moving animals.

3470. Smith, Judith M.; Renault, Pierre F. & Schuster, Charles R. (U Chicago, Pritzker School of Medicine) **A mild restraint and chronic venous catheterization system for cats.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 713-715.—Describes a restraint system which protects temporary connections to chronic physiological implants during recording sessions and permits free movement of the head and extremities. Procedures for construction and implantation of a venous catheter device are included.

3471. Smith, M. Brewster. (U California, Santa Cruz) **Beyond journalistic scouting: Evaluation for better programs.** *Journal of Applied Behavioral Science*, 1975(Jul-Sep), Vol 11(3), 290-297.—Comments on W. R. Meyers's (see PA, Vol 55:Issue 3) analysis of political problems in evaluation research. The author's experiences with a Peace Corps evaluation project in Ghana is described to demonstrate the importance of adapting to cross-cultural elements in evaluation research, and the advantages and disadvantages of summative and formative evaluations and prospects for social research in a political context are discussed.

3472. Turner, Francis J. **Reflections on clinical practice: Enough of art, more of science.** *Clinical Social Work Journal*, 1975(Sum), Vol 3(2), 128-134. After reviewing 3 clinically oriented books, a strong argument is made for carefully designing research projects to objectively identify areas of clinical effectiveness. Several study suggestions are made.

PSYCHOMETRICS

3473. Anderson, Norman H. (U California, La Jolla) **On the role of context effects in psychophysical judgment.** *Psychological Review*, 1975(Nov), Vol 82(6), 462-482. Applied functional measurement and A. Parducci's (1974) range-frequency theory to the analysis of an iterative technique for category ratings propounded by S. S. Stevens. Range-frequency theory is shown to provide a theoretical foundation for the iterative technique that is testable. It also provides a basis for

interpreting the limit function from the iterative technique as the psychophysical law. This perspective is extended to context effects in general. Among other things, the functional measurement diagram is used to show that in contrast to the traditional approach based on magnitude estimation, functional measurement (a) allows context effects to be treated as substantive phenomena, interesting in themselves, useful in scaling, not just undesirable biases; (b) provides a clear conceptual definition of interval scale; (c) does not require sensation to be conscious; and (d) derives the psychophysical law from the more basic psychological law. (2 p ref)—*Journal abstract.*

3474. Ash, Ronald A. & Edgell, Steven L. (Arizona State Personnel Div, Phoenix) **A note on the readability on the Position Analysis Questionnaire (PAQ).** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 765-766.—The Position Analysis Questionnaire (PAQ) is a structured job analysis questionnaire composed of worker-oriented job elements. 4 readability indexes—the Dale-Chall, the Flesch, the FOG (R. Gunning), and the SMOG (H. McLaughlin)—were applied to both the directions and questions of the PAQ. The PAQ directions reach a college readability level using the Flesch and SMOG indexes and reach the college graduate level using the Dale-Chall and FOG indexes. The PAQ questions reach the college graduate readability level on all 4 indexes. Implications regarding the use of the PAQ in light of its difficult level of readability are discussed.—*Journal abstract.*

3475. Berch, Daniel B. (U New Mexico) **Measures of sensitivity and response bias for the probe-type serial memory task.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 149-158.—Describes several measures of sensitivity (unbiased retention) and response bias and evaluates them in terms of their applicability to the probe-type serial memory task. Suggestions are made regarding the major factors that should be considered when selecting an index for one's data. (20 ref)

3476. Bruvold, William H. **Judgmental bias in the rating of attitude statements.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 605-611.—Judges (107 26-73 yr olds) holding divergent attitudes toward high contact uses of water reclaimed from community sewage rated 2 sets of attitude statements regarding this issue. Results show a close linear relationship between item scale values obtained from positive and negative attitudinal groups, and also a somewhat reduced range of ratings for judges holding unfavorable personal attitudes toward reuse. These findings, and the findings of previous research on this issue, are seen as being consonant with an item displacement theory of rating performance and supportive of equal interval measurement.—*Journal abstract.*

3477. Bull, Patrick E. (U Waikato, Hamilton, New Zealand) **Structure of occupational interests in New Zealand and America on Holland's typology.** *Journal of Counseling Psychology*, 1975(Nov), Vol 22(6), 554-556.—Compared the correlations of scores on the Campbell-Holland Interest Scale for 150 American men and women, half of whom were psychology undergraduates, and 147 New Zealand psychology undergraduates. The

factor structure was shown to be similar in the 2 samples.
—*Journal abstract.*

3478. **Cascio, Wayne F.** (Florida International U) **Accuracy of verifiable biographical information blank responses.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 767-769. Potential verifiability is frequently cited as a deterrent to falsification of biographical information blanks, yet little empirical evidence exists on this question. The present study investigated the relationship between reported and verified responses to 17 biographical information blank items for 112 officers of a metropolitan police department and determined the frequency and magnitude of biographical information blank discrepancies. Overall reported responses were strikingly accurate, correlations ranging from 0.41 to 1.0, with a median correlation of 0.94. These relationships were not appreciably modified by age or length of employment.—*Journal abstract.*

3479. **Drude, Kenneth P.** (U Illinois, Urbana-Champaign) **A study of the construct validity of self concept measures.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 850-851.

3480. **Feild, Hubert S.** (Auburn U) **Effects of sex of investigator on mail survey response rates and response bias.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 772-773.—Conducted a study to determine if the investigator's sex in a mail survey concerning attitudes toward women had any effect on (a) return rates and (b) expressed attitudes toward women. The Attitudes Toward Women Scale was sent to 306 randomly selected university faculty members (215 questionnaires returned). No significant differences were found due to the investigator's sex for return rates or for expressed attitudes.—*Journal abstract.*

3481. **Friedman, Hershey H. & Goldstein, Larry.** **Effect of ethnicity of signature on the rate of return and content of a mail questionnaire.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 770-771.—Of 1,200 travel agents sent a questionnaire dealing with topics of current interest to them and signed by either a Jewish, Hispanic, or ethnically unidentifiable name, 770 responded. It was hypothesized that if ethnic bias existed it would be reflected in significantly different rates of return and/or by significantly different responses. Analysis of data suggests that the ethnicity of the signature has no significant effect either on the respondents' returning of the questionnaire or on the content of their responses.—*Journal abstract.*

3482. **Gensch, Dennis H. & Golob, Thomas F.** (U Wisconsin, School of Business Administration, Milwaukee) **Testing the consistency of attribute meaning in empirical concept testing.** *Journal of Marketing Research*, 1975(Aug), Vol 12(3), 348-354. Notes that consumers' preferences are derived in part from their perceptual evaluations of alternatives and argues that the consistency of these alternatives should be tested. An empirical example, based on mass-transit concept testing, is used to illustrate the perceptual comparison method. (22 ref)

3483. **Green, David M. & Luce, R. Duncan.** (Harvard U, Lab of Psychophysics) **Parallel psychometric functions from a set of independent detectors.** *Psychological Review*, 1975(Nov), Vol 82(6), 483-486.—Discusses the

problem of combining several elementary detectors by the extreme decision rule of responding "no" only when all elementary detectors respond "no" and "yes" otherwise. The question of which psychometric functions for the detectors have the property that the resulting psychometric function is simply the original function displaced in the logarithm of the physical scale is then answered.—*Journal abstract.*

3484. **Huber, Joel.** (Purdue U) **Predicting preferences on experimental bundles of attributes: A comparison of models.** *Journal of Marketing Research*, 1975(Aug), Vol 12(3), 290-297.—Tested the ability of various models to predict individual preferences on stimuli defined by physical characteristics. Data are drawn from analysis of a convenience sample of 22 university students' preferences among tea mixes. Within all models, metric routines were superior to nonmetric routines. Across models, differences in predictive ability were not found to be great compared to pragmatic or theoretical differences. (16 ref)—*Journal abstract.*

3485. **Kaufman, Alan S. & Kaufman, Nadeen L.** (U Georgia) **Social-class on the McCarthy Scales for Black and White children.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 205-206.—Explored the relationship of social class to the cognitive and motor Indexes yielded by the D. McCarthy (1972) scales for representative groups of 2½–8½ yr old Blacks ($n = 154$) and Whites ($n = 862$). For both groups, Ss categorized as middle class scored significantly higher than working-class Ss on each of the 6 indexes. The pattern of mean Indexes for different occupational groups resembled the pattern of mean IQs found in previous studies.—*Journal abstract.*

3486. **Keating, Daniel P.** (U Minnesota) **Possible sampling bias in genetic studies of genius.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 657-662.—Analyzes the data from L. M. Terman's *Genetic Studies of Genius* (1925-1959) relating to sample size, mean IQ, and variance of IQ scores in terms of their conformation to the theoretically projected statistics derived from a consideration of the normal curve. Deviations from the theoretical projections lead to the probable conclusion that the sample size was too small, with the IQ scores clustered more closely about a significantly higher mean than projected. Although the major findings of the *Genius* study are not cast into doubt by this analysis, caution is urged with respect to comparisons to a normal sample when the differences are not large.—*Journal abstract.*

3487. **Kitwood, Tom M. & Smithers, Alan G.** (U Bradford, School of Research in Education, England) **Measurement of human values: An appraisal of the work of Milton Rokeach.** *Educational Research*, 1975(Jun), Vol 17(3), 175-179.—Argues that methods currently available for studying values within a sociopsychological framework are inadequate. If the interrelationships between values and education are to be systematically explored it is essential that approaches be devised which reflect more accurately the nature of human valuing. Some of the problems associated with present methods are illustrated by examining in detail one of the latest and, most impressive to become available—the Rokeach Survey of Values. It is suggested

that, in spite of its simplicity and ready appeal, it suffers from important weaknesses (notably its inadequate conception of human values) which are liable to distort the information which it appears to give. Some of the requirements for an adequate questionnaire method of studying values are outlined, but the importance of obtaining corroborative evidence from idiographic and field approaches is also stressed.—*Journal abstract.*

3488. Kraut, Allen I.; Wolfson, Alan D. & Rothenberg, Alan. (IBM, Personnel Research, Armonk, NY) **Some effects of position on opinion survey items.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 774-776.—Tested the effect of putting opinion survey items in different positions in a questionnaire. Equivalent samples of 284 and 281 employees in an industrial corporation completed similar questionnaires in which the placement of 46 Likert-type items were reversed. Respondents answered with less extreme responses and were slightly more likely to omit replies when items were placed later in the questionnaire. Findings suggest that comparisons of responses to identical items used in different surveys may be misleading if they appeared in different position or context.—*Journal abstract.*

3489. Lawrence, Raymond J. (U Lancaster, England) **Consumer brand choice: A random walk?** *Journal of Marketing Research*, 1975(Aug), Vol 12(3), 314-324.—Examines A. A. Kuehn's (1961, 1962) discussion of a possible connection between consumer brand-buying behavior and R. R. Bush and F. Mosteller's (1955) stochastic model of learning. It is shown that this linear learning model is a method for calculating a moving average and has no necessary connection with human psychological processes. (29 ref)

3490. Messick, Samuel. (Educational Testing Service, Princeton, NJ) **The standard problem: Meaning and values in measurement and evaluation.** *American Psychologist*, 1975(Oct), Vol 30(10), 955-966.—Discusses the concepts of construct and content validity, the requirements of convergent and discriminant evidence, norm and criterion-referenced interpretations, values in measurement and the uses of counterhypotheses, and the identification of bias. The importance of construct-referencing all measurement is noted. The need for a dialectical evaluation where a particular thesis is confronted with its antithetical elements is stressed. This approach should help uncover assumptions and ideologies implicit in many measurement and evaluation activities. (61 ref)—*R. Tomasko.*

(U Haifa, Israel) **ITANA-III: A FORTRAN IV program for multiple-choice tests and item analysis.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 683-684. Describes a 2-phase program that permits computation of psychometric characteristics of multiple-choice examinations including test statistics (Phase I) and item statistics (Phase II). Consisting of 280 statements, the program can handle up to 200 items with not more than 9 alternatives from samples of examinees not exceeding 2,000.

3492. Pras, Bernard & Summers, John. (Ecole Supérieure des Sciences Economiques et Commerciales, Cergy, France) **A comparison of linear and nonlinear evaluation process models.** *Journal of Marketing Re-*

search, 1975(Aug), Vol 12(3), 276-281.—Reports the findings of a comparative analysis of linear and nonlinear evaluation process models using 3 (number of models) \times 3 (levels of number of attributes) \times 2 (levels of acceptability of alternatives) factorial design. Results suggest nonlinear models may provide important vehicles for understanding consumer preference formation. (21 ref)

3493. Prytulak, Lubomir S. (U Western Ontario, London, Canada) **Critique of S. S. Stevens' theory of measurement scale classification.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 3-28.—Numerous observations are incongruous with S. S. Stevens-tradition theory of scale classification: (a) ratio scales, when available, are not necessarily preferred to interval scales; (b) the same scale changes classification depending on the use to which it is put; (c) a scale considered in isolation cannot be classified; (d) performing an inadmissible transformation on a scale entails no loss of information; and (e) the ratio scales of psychophysics do not qualify as interval scales. These incongruities result from such theorists' (a) belief that they classify scales when they really classify functions between scales; (b) belief that scientists seek new rules for assigning numbers to familiar events when, in fact, they seek new events to assign numbers to using familiar rules; and (c) confusion of function type with judgment type, leading to the erroneous claim that the ratio scales of psychophysics are distinct from other behavioral scales. Implications of the above interpretation are that (a) ranking of scales according to desirability is situation-specific—a situation-free ranking clashes with scientists' frequent preference for "inferior" scales and (b) proscriptions against mathematical manipulations or tests of statistical significance apply not to a single scale but to inferences from one scale to another. (43 ref)—*Journal abstract.*

3505. Cleary, T. Anne; Humphreys, Lloyd G.; Kendrick, S. A. & Wesman, Alexander. **Educational uses of tests with disadvantaged students.** *American Psychologist*, (Jan), Vol 30(1), 15-41.—Presents a report, written in response to a manifesto by the Black Psychological Association asking for a moratorium on the use of psychological tests with students from disadvantaged backgrounds, which attempts to clarify the nature of psychometric tests, their uses, and their abuses, and propose some alternatives for standardized assessments. Possible causes for Blacks' lower performances on verbal and nonverbal intelligence tests are considered in relation to social attitudes. It is noted that test use makes no causal assumptions about the effects of heredity or environment. Other topics in the report include (a) a comprehensive definition of abilities, particularly general intelligence; (b) some common classes of misuse and misinterpretation; (c) an account of the kinds of statistical information needed to use a test effectively; and (d) a discussion of existing alternatives to ability tests. The need for more diagnostic and mastery tests, tests which measure important qualities other than intelligence, more regression comparisons and normative data, and more adequate studies of moderator variables is examined. (34 ref)—*L. Gorsey.*

3506. Cronbach, Lee J. (Stanford U) **Five decades of public controversy over mental testing.** *American Psychologist*, 1975(Jan), Vol 30(1), 1-14. Discusses the conflict over the validity of intelligence testing, using it as an example of what happens when scientists and academicians enter the area of public policy-making. Political and social aspects of Arthur Jensen's 1969 article and resulting controversy are examined, and some possible generalizations (e.g., the zeitgeist and the media, how the scientist conducts himself in public, and the consequences of knowledge) are discussed. (Queen Elizabeth Hosp for Children, Cambridge, England) **The "Animals Questions" technique: A short projective instrument.** *British Journal of Projective Psychology & Personality Study*, 1975(Jun), Vol 20(1), 31-32.—Describes the Animal Questions, a brief projective technique involving 6 questions and a scoring system based on Erikson's developmental stages.

3512. Faschingbauer, Thomas R. (U North Carolina, Chapel Hill) **A short written form of the group MMPI.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 409.

3513. Fifield, Mary R. & Ommanney, Pierce C. (United States International U) **The measurement of self-actualization.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1745-1746.

3514. Finch, A. J.; Kendall, Philip C.; Nelson, W. M. & Newmark, Charles S. (Virginia Treatment Ctr for Children, Richmond) **Application of Faschingbauer's abbreviated MMPI to parents of emotionally disturbed children.** *Psychological Reports*, 1975(Oct), Vol 37(2), 571-574.—Investigated the potential usefulness of T. R. Faschingbauer's abbreviated MMPI with 180 22-37 yr old parents of emotionally disturbed children referred for residential treatment. Ss' MMPI profiles were scored for this short form, and scores were compared with norms from the standard MMPI. While correlations were significant, many mean scores on the Faschingbauer were significantly different from those on the full MMPI. Modest correspondence between the 2 formats on indexes of psychopathology, profile peaks, and validity criteria was found. It is concluded that use of this form is not justified with the present population.—Journal abstract.

3515. Flann, Colln. (Borough of Havering, England) **An abbreviated W.I.S.C. compared against the fully administered W.I.S.C. AEP (Association of Educational Psychologists) Journal**, 1975(Sum), Vol 3(9), 18-22. —Compared IQs derived from the fully administered WISC and from an abbreviated version consisting of the

Similarities, Vocabulary, Block Design, and Object Assembly subtests. Ss were 105 English schoolchildren referred for psychological services. With a correlation of 0.92 between the 2 forms, this abbreviated version appears to provide a suitable alternative to the fully administered WISC in instances where a bare statement of intellectual status is required.—I. L. Zimmerman.

3516. Fuchs, Albert. (U Bonn, Psychologisches Inst, W Germany) **[A study of metric problems in the semantic differential technique.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 114-124. Semantic ratings are scaled by the categorical judgment model. Comparing the interval widths thus obtained with the assumed ones suggests that the assumption of equality of intervals usually made when applying a semantic differential is inaccurate. Nevertheless, scale and concept structures obtained by the direct and indirect scaling methods are in strong agreement. (22 ref)—English summary.

3517. Gardner, P. L. (Monash U, Faculty of Education, Clayton, Australia) **Attitude measurement: A critique of some recent research.** *Educational Research*, 1975(Feb), Vol 17(2), 101-109.—Examines some recent British research in attitude measurement and contends that a few of these studies display serious faults in instrument design and usage. It is posited that effective research in this field demands the construction of attitude scales which clearly reflect some underlying theoretical construct; it requires distinct variables to be kept separate and not added together to produce meaningless total scores; and it requires instruments chosen as outcome measures in research on treatment effects to display some defensible connection with the treatment being studied. (19 ref)—Journal abstract.

3518. Gergen, Paul C. (U Washington, Seattle) **Factor structure and method effects among major personality inventory item properties.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1748.

3519. Hansen, Holger & Kruuse, Emil. (School-psychological Office, Albertslund, Denmark) **[An investigation of reading level in grades 3-7 in Albertslund with the silent reading tests FII and FIII.]** (Danh) *Skolepsykologi*, 1975, Vol 12(3-4), 283-298.—Describes FII and FIII as relevant forced-choice paragraph tests requiring understanding beyond the literal reading. The FII was administered to Ss in grades 3 and 4 and, 1 yr later to Ss in grades 3-7 in the Albertslund school district. Approximately 400-600 students served as Ss (the response rate was 80-90%). Tentatively, it is concluded that compared to earlier norms (1962) there was greater deviation (i.e., more good and bad readers with bad understanding).—Journal abstract.

3520. Hensley, Doris R.; Hensley, Wayne E. & Munro, Hugh P. (Bloomington Hosp, IN) **Factor structure of Dean's alienation scale among college students.** *Psychological Reports*, 1975(Oct), Vol 37(2), 555-561.—D. G. Dean's alienation scale was developed to measure the subscales of powerlessness, normlessness, and social isolation. Whether or not the 24 items of his scale actually measure these 3 types of alienation was not tested by Dean. R. A. Dodder (1969) found that, for a sample of 201 Kansas housewives, the Dean scale yielded 8 factors, none of which fit Dean's typology. The

present study also found 8 factors for a sample of 240 undergraduates, though the resultant factors differed slightly from Dodder's. While the Dean scale does appear to measure several forms of alienation, it does not appear to measure in any pure form what it was designed to measure. (23 ref)—*Journal abstract*.

3521. Hofmann, Richard J. (Miami U, OH) **The concept of efficiency in item analysis.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 621-640.—Derives a new item analysis index, e , as a function of difficulty and discrimination to represent item efficiency. It is demonstrated algebraically that the maximum discriminating power of an item may be determined from its difficulty, and then item efficiency is defined as the ratio of observed discrimination to maximum discrimination. The magnitude of the e -index will range from zero to unity and will provide additional information for item analyses.—*Journal abstract*.

3522. Hogan, H. Wayne. (Tennessee Technological U) **Validity of a symbolic measure of authoritarianism.** *Psychological Reports*, 1975(Oct), Vol 37(2), 539-543.—A symbolic, nonverbal measure of authoritarianism, the SF (Symbolic Fascism) Test, was responded to by male and female, White and Black business school students, undergraduates, and graduate social work students ($N = 287$). Scores on the measure showed low (0.35-0.39) predictable "known groups" validity and were generally correlated, as theoretically anticipated, with both objectively measured and self-perceived conservatism, birth order, religious fundamentalism, subjective social-class position, and intrafamilial consistency of psychological attributes and sociopolitical ideologies. Given the methodological limitations of verbal authoritarianism measures, these results suggest some potential advantages of the presently reported nonverbal test of the authoritarianism dimension. (15 ref)—*Journal abstract*.

3523. Katz, Jeremy M. (U Michigan) **The validity of self-appraisals of mental health.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1751.

3524. Kaufman, Alan S. (U Georgia) **Note on interpreting profiles of McCarthy scale indexes.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 262. Used a formula derived by F. B. Davis (1959) to provide a simple empirical technique for assessing a child's relative strengths and weaknesses on the McCarthy Scales of Children's Abilities. The technique requires determining whether each scale index earned by a child differs significantly from his own average index.

3525. Kaufman, Alan S. (U Georgia, Coll of Education) **Factor structures of the McCarthy Scales at 5 age levels between 2½ and 8.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 641-656. Factor analyzed the McCarthy Scales of Children's Abilities (MSCA) at 5 age levels: 2½, 3 ¾, 4 ¼, 5 ½, and 6½ 7½ 8½ yrs. The standardization sample ($N = 1,032$) provided the source of data. Varimax rotated factors akin to 4 of the 6 MSCA scales—General Cognitive, Verbal, Memory, and Motor—appeared at age 2½ and tended to appear at all older age levels. Factors akin to the Perceptual-Performance and Quantitative scales emerged at ages 3 ¾ and 5 ½, respectively. Overall findings are interpreted from a developmental perspective, and the data offer evidence for the constraint validity if the MSCA. (17 ref)—*Journal abstract*.

3526. Kearns, Jack & Meredith, William. (Educational Testing Service, Princeton, NJ) **Methods for evaluating empirical Bayes point estimates of latent trait scores.** *Psychometrika*, 1975(Sep), Vol 40(3), 373-394.—Empirical Bayes point estimates of latent trait scores, derived under the assumptions of one of several test theory models, display a certain degree of instability unless the sample size is sufficiently large. A measure of this instability over repeated sampling is the distribution of the overall expected squared error loss which converges, both in probability and in the mean, to the minimum (Bayes) overall expected loss as sample size increases. An asymptotic distribution theory is developed, and the resulting large sample approximation is compared with results obtained from simulated data. Attention is also given to the effects of using a smoothing procedure. (20 ref)—*Journal abstract*.

3527. Keaveny, Timothy J. & McGann, Anthony F. (U Wyoming) **A comparison of behavioral expectation scales and graphic rating scales.** *Journal of Applied Psychology*, 1975(Dec), Vol 60(6), 695-703. Compared ratings derived from behavioral expectation scales developed by 147 personnel management students with ratings based on graphic rating scales. The rates were 4 college professors, and the raters were the 183 students in their classes. The behaviorally anchored scales resulted in less halo error, or alternatively, more independence in ratings of different dimensions of performance. The behaviorally anchored scales did not correct for leniency in ratings. These results were observed both among raters who participated in developing the behavioral expectation scales and among similar raters who did not take part in this process. The factor structures of the 2 rating formats were essentially equivalent in "cleanness." Neither solution was judged superior to the other. However, the behavioral expectation scale format possessed greater discriminant validity. *Journal abstract*.

3528. Langfeldt, Hans-Peter. (School of Pedagogy, Heidelberg, W Germany) **[A contribution on the factor structure of the Leistungsprüfsystem (LPS).]** (Germ) *Diagnostica*, 1975, Vol 21(3), 123-129.—Reports a cross-validation of the Leistungsprüfsystem (LPS, W. Horn, 1962), a German differential abilities inventory. The sample consisted of 58 male and 48 female teachers enrolled in a pedagogy course. Factor analysis of the 15 subtests of the LPS yielded 2 factors, a result differing markedly from Horn's 7-factor solution. The means of the new sample on Horn's original factors are higher and its variances are smaller than those obtained by Horn's sample. The factorial structure and norms of the LPS appear to be sample specific.—*M. Morf*.

3530. Milgram, Norman A. & Milgram, Roberta M. (Tel-Aviv U, Israel) **Dimensions of locus of control in children.** *Psychological Reports*, 1975(Oct), Vol 37(2), 523-538.—Developed the Tel-Aviv Locus of Control Scale, a multidimensional measure which includes 3

dimensions of content, time, and orientation toward success-failure outcomes. The scale, together with IQ and personality measures, was administered in 2 studies to 298 average and 166 gifted Israeli 4th-8th graders. Content was measured in 3 important settings in the Ss' life: school, home, and neighborhood. The time dimension referred to the difference between assuming responsibility for events of the present and past vs the expression of competence to affect future outcomes. Internal consistency and reliabilities of the new instrument were adequate, especially for the Future scale, and the 3 dimensions were empirically distinguishable. Relationships were found between locus of control and age, scholastic achievement, and personality variables. (26 ref)—*Journal abstract*.

3531. Miron, Mordechai. (Tel-Aviv U, School of Education, Israel) **A study of cross-cultural factorial structure of intelligence.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 92-94.—Studied the degree to which the primary mental abilities found in American samples appear in Ss with a different cultural and linguistic background. The Lorge-Thorndike Intelligence Test, Level A, Form 1, was translated into Hebrew and administered to 180 Israeli 4th, 5th, and 6th graders. Results indicate that the factor structure of the translated test is consistent with the English original and that the test items retain their characteristics with translation and administration in another culture.—*R. Tomasko*.

3532. Nakatsuka, Zenjiro & Okumoto, Takaaki. (Osaka City U, Japan) [The work curve of Uchida-Kraepelin Psychodiagnostic Test: I. Analysis by two components model.] (Japn) *Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 68-75.—Describes the construction of a mathematical model of the work curve of the Uchida-Kraepelin Psychodiagnostic Test. The proposed model is composed of 2 components—learning and fatigue. A theoretical curve, which includes 5 parameters, was derived from the model, and D. W. Marquardt's (1963) method was used to estimate these parameters. It is argued that an estimation of these parameters can be performed for individual work curves.—*English abstract*.

3534. Reilly, Richard R. **Empirical option weighting with a correction for guessing.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 613-619. Because previous reports have suggested that the lowered validity of tests scored with empirical option weights might be explained by a capitalization of the keying procedures on omitting tendencies, a procedure was devised to key options empirically with a "correction-for-guessing" constraint. The new procedure was used with Graduate Record Examinations data taken from 2 samples totaling 9,916 answer sheets. Results show smaller increases in reliability than those observed when unconstrained procedures were used, but validities for quantitative subforms were not appreciably lowered. Validities for verbal subforms were lowered slightly, however.—*Journal abstract*.

3535. Reimer, Donna C.; Eaves, Linda C.; Richards, Ronni & Crichton, John U. (Health Ctr for Children, Vancouver, Canada) **Name-printing as a test of developmental maturity.** *Developmental Medicine & Child Neurology*, 1975(Aug), Vol 17(4), 486-492.—Attempted to derive a practical scoring technique for name-printing by 5-6 yr olds as a quick test of skills and maturity. The relationship of the Print-Your-Name test scores to other established tools of developmental assessment was examined. Teachers' assessments of Ss' readiness for academic promotion and of those with school problems tend to correlate with test scores. (French, German, & Spanish summaries)—*Journal summary*.

3544. Armenakis, Achilles A. & Feild, Hubert S. (Auburn U) **Evaluation of organizational change using nonindependent criterion measures.** *Personnel Psychology*, 1975(Spring), Vol 28(1), 39-44.—Describes a statistical method for evaluating organizational change from time series data.—J. McKillip.

3545. Bortz, Jürgen. (Technischen U Berlin, Inst für Psychologie, W Germany) [Critical remarks on the employment of non-Euclidean metrics in the framework of multidimensional scaling.] (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 196-212.—J. B. Kruskal's nonmetric multidimensional scaling technique is occasionally used to find the best Minkowski-Metrik underlying the data. The problem of the uniqueness of such a decision is examined. Examples confirm the conjecture that the question of best metric cannot be answered definitely using this technique. Furthermore, configurations are obtained which cannot be interpreted uniquely. (20 ref)—English summary.

3546. Brown, Morton B. **The asymptotic standard errors of some estimates of uncertainty in the two-way contingency table.** *Psychometrika*, 1975(Sep), Vol 40(3), 291-296.—Proposes estimates of conditional uncertainty, contingent uncertainty, and normed modifications of contingent uncertainty for the 2-way contingency table. The asymptotic standard errors of the estimates are derived.

3547. Carroll, Robert M. & Nordholm, Lena A. **Sampling characteristics of Kelley's ϵ^2 and Hay's ω^2 .** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 541-554.—Reviews and evaluates statistics used to estimate the population correlation ratio. The sampling distributions of Kelley's ϵ^2 and Hays's ω^2 are studied empirically by computer simulation within the context of a 3-level 1-way fixed effects analysis of variance design. These statistics have rather large standard errors when small samples are used. As with other correlation indices, large samples are recommended for accuracy of estimation. Both ϵ^2 and ω^2 are negligibly biased. Heterogeneity of variances has negligible effects on the estimates under conditions of proportional representativeness of sample sizes with respect to their population counterparts, but combinations of heterogeneity of variance and unrepresentative sample sizes yield especially poor estimates. *Journal abstract.*

(Guru Nanak U, Amritsar, India) **Identification and measurement of academic over- and underachievement.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 95-103.—Cites the inadequacy of the theoretical assumption that a perfect relationship between the measures of criterion and predictor variables is approachable. Results of the present empirical study show that this assumption is not tenable. 164 female pre-university students were administered a verbal intelligence test, and marks in 2 examinations for 3 study subjects were used as achievement measures. 29 overachievers and 27 underachievers were identified from the results. Results of t tests show that the over- and underachievers did not differ in terms of intelligence but did differ significantly in terms of academic achievement (i.e., the 2 differing groups were equated in terms of the predictor variable and differed in terms of the criterion variable). A scientifically sound method of identifying over- and underachieving pupils is proposed. (31 ref)—*Journal abstract.*

3550. Dziuban, Charles D.; Shirkey, Edwin C. & Peebles, Thomas O. (Florida Technological U) **On the independence of variable sets.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 539-540.—An illustration of a test for independence is provided with a mixed set of variables. The matrix consists of 10 tests of interest and 4 random deviates in which the relationship between sets is demonstrated to be minimal. The result is discussed for a situation in which factoring methods might be considered.—*Journal abstract.*

(U Bridgeport) **A computer program to calculate adjusted and unadjusted interrater reliabilities for sets and subsets of judges.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 689-691. Describes a program which, given judges' ratings on a set of variables pertaining to Ss or events, will produce for each variable a printed analysis of variance summary table for between Ss events, within Ss events, and between judges sources of variability; a reliability coefficient, an adjusted reliability coefficient and means and standard deviations for each rater. Further, analysis of variance and reliability output for subsets of judges is generated.

3553. Henry, Franklin M. (U California, Berkeley) **Absolute error vs "E" in target accuracy.** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 227-228.—The composite error E (i.e., square root of $\sigma^2 + \epsilon^2$) yields multiple R approximating unity with the variable error v and constant error c , however v is not adequately represented in all of the absolute error scores A , as verified by a lower multiple correlation.

3554. Jackson, Douglas N. & Skinner, Harvey A. **Univocal varimax: An orthogonal factor rotation program for optimal simple structure.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 663-665.—Describes univocal varimax, a strategy particularly relevant to research problems in which each rotated factor should be marked by a relatively tight cluster of variables. A FORTRAN IV program, UNIVMX, is described for the efficient analysis of large input factor loading matrices.

3555. Jäger, Reinhold. (U Mannheim, Fachbereich Psychologie, W Germany) **[The standardization of principles governing moderating variables: Possibilities and limits.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 97-113.—Examines the need to unify moderating variables in an attempt to limit the effect of such variables in psychological research. The problem has been the different aspects of partial samples, which make it difficult to come to significant general conclusions. The procedure of smoothing out subvariables to reduce the influence of these moderating effects is studied. Extensive mathematical considerations are employed to determine the relative significance of moderating variables, using probability factors. Human intelligence is used as an example of the need to control the moderating variables. (English abstract) (17 ref)—C. D. Bauer.

3556. Jäger, Reinhold. (U Mannheim, Otto-Selz-Inst für Psychologie und Erziehungswissenschaft, W Germany) **[Statements whose validity depends on the statistical method: Some limiting factors.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 253-264.—Suggests that some statements made on the basis of correlation-oriented designs should be considerably restricted, because methodological artifacts may reduce the extent of correlation coefficients. It is therefore doubtful whether such data have any relevancy at all. Further processing of such data in statistical analyses is considered pointless.—English summary.

3557. Korth, Bruce & Tucker, Ledyard R. (U Illinois, Chicago Circle) **The distribution of chance congruence coefficients from simulated data.** *Psychometrika*, 1975(Sep), Vol 40(3), 361-372.—Notes that all attempts to study the stability of factors depend on having some useful statistic that measures the degree of similarity between factors. This study attempts to provide some normative data about the distribution of one measure of similarity, the congruence coefficient, through a Monte Carlo technique. The matching of "chance" factor patterns was done by the method of L. R. Tucker (1951). Statistical tests of the results, based on similarities of the method to canonical and multiple correlation, seemed satisfactory. The tabled results can be used as guides to the significance of congruence coefficients for some cases. The consistencies of the data indicate that a functional resolution may be possible, but none was found. (28 ref)—Journal abstract.

3558. Kuncze, Joseph T. & Miller, Douglas E. (U Missouri, Columbia) **Random variables and correlational overkill.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 529-534. Argues that research findings may be more publishable if significant results are reported. This type of publication bias would increase the likelihood of "chance" relationships being

disseminated. The implications of these assumptions were empirically investigated in a correlational analog study with 220 college graduates. A large number of significant relationships were found in several groups of Ss between their actual scores on 45 SVIB scales and scores on 10 "experimental" scales which were determined by a set of random numbers. Furthermore, "logical" factors were shown to underlie relationships which existed among scores on a given random scale with its significant correlations to SVIB scales. Considerations in such overkill in simple correlational studies are the S-to-variable ratio, variable independence, and more stringent probability levels.—Journal abstract.

3559. Levy, Kenneth J. (State U New York, Buffalo) **Some multiple range tests for variances.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 599-604.—Notes that the E frequently is interested in making inferences about treatment variances instead of, or in addition to, inferences about means. 3 multiple range tests are proposed for the purpose of specifying which treatment variances or sets of variances are homogeneous. The procedures are based upon the F_{max} statistic, Cochran's statistic, and a normalizing log transformation of the sample variances. All 3 tests depend heavily upon the underlying assumption of normality.—Journal abstract.

3560. Lukesch, Helmut & Kleiter, Gernot D. (U Konstanz, Fachbereich Erziehungswissenschaft, W Germany) **[The use of factor analysis: Description and criticism of the practice of a method.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 265-307.—Investigated the application of factor analysis to empirical data in articles in 5 German journals between 1953 and 1972. In judging the articles some of the criteria used are valid for empirical studies in general and others are appropriate for factor analytical studies alone. This criticism indicates why factor analytical investigations do not possess the theoretical significance which is assumed by many publications that use this method. (9% p ref)—English summary.

3561. Macready, George B. (U Maryland) **The structure of domain hierarchies found within a domain referenced testing system.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 583-598.—Assessed conditional states of item mastery found among items from different item domains and the effectiveness of various procedures for identifying such conditional relations. The item domains considered were from the curriculum area of multiplication of whole numbers, and were defined by a domain referenced testing system. Data were gathered during pilot and main studies from a total of 400 5th graders. It was possible to infer from the results of this study that the domain referenced testing system considered produced items which across domains showed strong conditional relations. Comparisons of goodness of fit were made among domain hierarchies with similar numbers of specified conditional relations generated by 2 different empirical procedures and by experts' judgment. Additional comparisons were made among models generated by the same procedure but with different numbers of specified conditional relations. Support for the validity of empirically generated hierar-

chies with moderate numbers of conditional relations among domains was provided.—*Journal abstract.*

3562. McClelland, Gary H. & Coombs, Clyde H. (U Colorado) **ORDMET: A general algorithm for constructing all numerical solutions to ordered metric structures.** *Psychometrika*, 1975(Sep), Vol 40(3), 269-290.—ORDMET is an algorithm applicable to structures such as are obtained from additive conjoint measurement designs, unfolding theory, general Fechnerian scaling, some special types of multidimensional scaling, and ordinal multiple regression. A description is obtained of the space containing all possible numerical representations which can satisfy the structure, the size and shape of which is informative. The Abelson-Tukey maximin r^2 solution is provided.—*Journal abstract.*

3563. Pandey, Tej N. & Shoemaker, David M. (California Dept of Education, Program Evaluation & Research, Sacramento) **Estimating moments of universe scores and associated standard errors in multiple matrix sampling for all item-scoring procedures.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 567-581. Describes formulas and computational procedures for estimating the mean and 2nd-4th central moments of universe scores through multiple matrix sampling. Additionally, procedures are given for approximating the standard error associated with each estimate. All procedures are applicable when items are scored either dichotomously or polychotomously.—*Journal abstract.*

3564. Peay, Edmund R. (Flinders U South Australia, Bedford Park) **Nonmetric grouping: Clusters and cliques.** *Psychometrika*, 1975(Sep), Vol 40(3), 297-313. —Presents a class of related nonmetric (monotone invariant) hierarchical grouping methods. The methods are defined in terms of generalized cliques, based on a systematically varying specification of the degree of indirectness of permitted relationships (i.e., degree of "chaining"). This approach to grouping provides a useful framework for grouping methods based on an a priori specification of the properties of the desired subsets, and includes a natural generalization for "complete linkage" and "single linkage" clustering, such as the methods of S. C. Johnson (1967). The central feature of the class of methods is a simple iterative matrix operation on the original disparities (inverse-proximities or dissimilarities) matrix, and one of the methods also constitutes a very efficient single linkage clustering procedure. (22 ref)—*Journal abstract.*

3565. Ramsay, J. O. (McGill U, Montreal, Canada) **Solving implicit equations in psychometric data analysis.** *Psychometrika*, 1975(Sep), Vol 40(3), 337-360. —Many data analysis problems in psychology may be posed conveniently in terms which place the parameters to be estimated on one side of an equation and an expression in these parameters on the other side. A rule for improving the rate of convergence of the iterative solution of such equations is developed and applied to 4 problems: the principal axis communality problem, individual differences multidimensional scaling, L , norm multiple regression, and L , norm factor analysis of a data matrix. The rule results in substantially faster solutions or in solutions where none would be possible without the rule. (16 ref)—*Journal abstract.*

3566. Rhenius, Detlef. (U Hamburg, Fachbereich Psychologie, W Germany) [Remarks on the procedure of bilateral linear transformation.] (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 125-130.—Points out some special properties of transformation procedures, due to G. Fischer and J. Roppert and to G. Krebs. Several of these properties are discussed as aids to interpretation of data and comparisons of research methods.—C. D. Bauer.

3567. Shine, Lester C. **Independence problems for certain tests based on the Shine-Bower error term.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 535-537.—Shows that, for the Shine-Bower single-S analysis of variance (ANOVA), the numerator and denominator of all F tests based on the Shine-Bower error term are independent of each other. It is also shown that the same property holds for all such tests in the Shine Combined ANOVA except for the test for the Trial \times S interaction.—*Journal abstract.*

3568. Straton, Ralph G. (U Sydney, Australia) **Obtaining paired comparisons data from multiple rank orders using partially balanced incomplete block designs.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 555-566.—Complete paired comparisons data were obtained by the method of multiple rank order (MRO) in the context of gathering rank order preferences of Grade 6 students, their parents, and their teachers for instructional objectives. Partially balanced incomplete block designs with 2 associate classes were used in the MRO instruments. The use of partially balanced designs may yield several benefits to a researcher including a reduction in the number of blocks of stimuli to be ranked, a measure of the internal consistency of S's choices, and a concentration of experimental effort upon comparisons of the most critical stimulus pairs. The benefits and associated costs of using these designs are discussed in the light of the data obtained in the study. It is recommended that whenever rank orders or paired comparisons data are called for in a study that serious consideration be given to the use of the MRO method. Furthermore, it is suggested that the overall purposes of a study may best be served by the use of a partially balanced rather than a balanced incomplete block design in the MRO method.—*Journal abstract.*

3569. Swain, A. J. (U Adelaide, Australia) **A class of factor analysis estimation procedures with common asymptotic sampling properties.** *Psychometrika*, 1975(Sep), Vol 40(3), 315-335.—Considers a general class of estimation procedures for the factor model. The procedures are shown to yield estimates possessing the same asymptotic sampling properties as those from estimation by maximum likelihood or generalized least squares, both of which are special members of the class. General expressions for the derivatives needed for Newton-Raphson determination of the estimates are derived. Numerical examples are given, and the effect of the choice of estimation procedure is discussed. (17 ref)—*Journal abstract.*

3570. Trichter, D. L. & Pedrini, D. T. (U Nebraska, Omaha) **A computer program for Fisher's exact probability test.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 717-719.—Presents a mathematical

discussion and algorithm for Fisher's test. The computer program for small and large (N of about 500) samples is available. Such technology, in most instances, makes approximation methods unnecessary.

3571. Turner, Charles F. (Columbia U) **The path analysis of complex recursive systems.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 667-669. Discusses methods for the path analysis of complex (i.e., not fully recursive) causal models. A computer program, PATHL, which simplifies analysis of such models and provides an option for automatically deleting marginal paths is described.

3572. Vegelius, Jan. (U Uppsala, Sweden) **CORALL, a FORTRAN IV program for correlation measures.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 711-712.—CORALL can compute a great number of different correlation and other statistical measures. The user is free to select among the measures and also among the variables that are read by the program. When a particular set of variables has been treated in the prescribed way, a new set may follow together with new measure definitions.

3573. Vegelius, Jan. (U Uppsala, Sweden) **SIEGEL, a FORTRAN IV program for nonparametrical methods.** *Educational & Psychological Measurement*, 1975(Aut), Vol 35(3), 713-715.—SIEGEL can perform any one of those nonparametric statistical methods that is mentioned in S. Siegel's (1956) work on the subject. The user is free to select among the methods and also among the samples that are read by the program. When a particular set of samples has been treated in the prescribed way, a new set may follow together with new method definitions.

3574. Wang, Ming-mei. (Purdue U) **The multidimensional analysis of preference data.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 401.

3575. Wherry, Robert J. (Ohio State U) **Underprediction from overfitting: 45 years of shrinkage.** *Personnel Psychology*, 1975(Spr), Vol 28(1), 1-18.—Reviews the problem of shrinkage in use of the multiple regression model in industrial prediction, based on 45 yrs of investigation. It is concluded that work done on cross validation with this model makes it more appropriate than analysis of variance, discriminant analysis, multiple contingency analysis, or canonical correlation for prediction, since these latter models are more liable to show shrinkage than the multiple regression model and they have not been studied in terms of the problem of cross validation. (21 ref)—J. McKillip.

3576. Zimmerman, Donald W. (Carleton U, Ottawa, Canada) **Probability spaces, Hilbert spaces, and the axioms of test theory.** *Psychometrika*, 1975(Sep), Vol 40(3), 395-412.—Notes that a branch of probability theory that has been studied extensively in recent years, the theory of conditional expectation, provides just the concepts needed for mathematical derivation of the main results of the classical test theory with minimal assumptions and greatest economy in the proofs. The collection of all random variables with finite variance defined on a given probability space is a Hilbert space; the function that assigns to each random variable its conditional expectation is a linear operator; and the properties of the conditional expectation needed to derive the usual test-

theory formulas are general properties of linear operators in Hilbert space. Accordingly, each of the test theory formulas has a simple geometric interpretation that holds in all Hilbert spaces. *Journal abstract*

3580. Fisher, Ronald P. (Ohio State U) **An examination of the unitization hypothesis as an explanation of the word apprehension effect.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 893.

3581. Gescheider, George A.; Sager, Lawrence C. & Ruffolo, Lydia J. (Hamilton Coll) **Simultaneous auditory and tactile information processing.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 209-216. Conducted 3 experiments with a total of 8 college students and 1 faculty member. Ss were required to perform perceptual tasks when stimuli were presented simultaneously in the auditory and tactile modalities and when they were presented in 1 of the modalities alone. Results indicate that when the demands on cognitive processes are small, auditory and tactile stimuli presented simultaneously can be processed as well as when stimuli are presented in only 1 modality. In a task which required a large amount of cognitive processing, it became difficult for Ss to maintain high levels of performance in both modalities and the distribution of attention became an important determinant of performance. The data are consistent with a theory that cognitive, but not perceptual, processing is disrupted when Ss have difficulty performing 2 perceptual tasks simultaneously. (19 ref)—*Journal abstract*.

(Allahabad U, India) Reciprocal facilitation and impairment in perception, learning and memory. *Indian Journal of Psychology*, 1974, Vol 49(4), 279-284.—80 male university students were shown 6 taboo and 6 neutral words while 40 controls were exposed to 12 neutral words under increasing illumination. Recognition threshold was measured for each word. The Ss then learned paired associates formed by associating the same words with nonsense trigrams. Learning recall was tested 10 min later. If an S's threshold for taboo words was higher than the mean threshold of controls, his threshold for the neutral words was lower. A similar phenomenon was observed in learning and memory. This is interpreted as indicating limited channel capacity of the perceptual apparatus and some common mechanism underlying the 3 processes.—*Journal abstract*.

(Vanderbilt U) The interference of various word parts on color naming in the Stroop test. *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 191-193.—Compared the interfering effects of various word parts on performance of the Stroop task, using 20 undergraduates as Ss. In different conditions, the 1st, middle, and last 2 letters of a color word formed color patches. While no condition produced as much interference as the control condition, the 1st part of a color word interfered with color naming more than other word parts. The addition of unrelated letters had little or no effect on the interference produced by the 1st part of the word. Results are consistent with suggestions that word perception often involves the activation of an articulatory motor program which is initiated by the 1st part of the word.—*Journal abstract*.

3593. Carlow, T. et al. (VA Hosp, Ocular Motor Neurophysiology Lab, Miami, FL) Saccadic eye movement latencies to multimodal stimuli: Intersubject variability and temporal efficiency. *Vision Research*, 1975(Nov), Vol 15(11), 1257-1262.—Studied the saccadic latencies to multimodal stimuli of 10 Ss to determine the range of inter-S variations and to derive values which are representative of the normal population. Responses to simple step and pulse-step stimuli were measured where the target mode and pulse width were randomized. A matrix notation was introduced to describe all of the relevant latency variables without ambiguity. In comparing these results with other studies, the importance is emphasized of considering differing experimental conditions. It is concluded that (a) inter-S variation is a significant factor in data interpretation, (b) temporal efficiency is inherent in saccadic decision making, and (c) new visual information is continuously available to alter the latency or cause the cancellation of the initial saccade.—*Journal abstract*.

3595. Claxton, Guy. (U London, Inst of Education, England) Why can't we tickle ourselves? *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 335-338.—When we tickle ourselves something prevents the sensation from being as strong as when someone else does it. It is suggested that the "something" may be the predictability of the stimulus, the presence of feedback from the movement of the arm doing the tickling, the presence of a corollary discharge from the voluntary movement of the tickling arm, and the absence of a social-sexual contact. 49 25-45 yr olds rated perceived "tickle-strength" in situations where they were tickled: (a) with their eyes closed; (b) with their eyes open; (c) with their own arm doing the tickling, but being moved by someone else; (d) by themselves. One group of Ss was divided into same-sex and different-sex S-E pairs. Results show significant effects of predictability and sensorimotor feedback.—*Journal abstract*.

3596. Eisler, Hannes. (U Stockholm, Sweden) Subjective duration and psychophysics. *Psychological Review*, 1975(Nov), Vol 82(6), 429-450.—Proposes 3 models concerned with the behavior of Ss estimating 2 successive durations. The accepted model assumes that the subjective total duration (sum of 1st and 2nd durations) and the 2nd duration are each accumulated in a separate sensory register. 5 experiments conducted with a total of 12 undergraduates are reported. In a duration-matching experiment, for instance, the difference between the contents of the 2 registers is matched to the content of the 2nd register. This model is accepted because (a) it

does not include any memory, thereby eliminating certain difficulties connected with coding and storing of duration; (b) it copes with characteristic features of duration discrimination; and (c) it can satisfactorily explain data obtained in 4 scaling experiments (magnitude estimation, matching, halving, and doubling of 10 durations between 1.3 and 20 sec). As a by-product, S. S. Stevens' power law is uniquely derived, and exponents are computed from matching data, thus eliminating the Ss' numerical behavior. The model also accounts for the time-order error for time. (36 ref) *Journal abstract*

3597. Epstein, William & Broota, Krishan D. (U Wisconsin, Madison) **Attitude of judgment and reaction time in estimation of size at a distance.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 201-204. Exp I, with 10 undergraduates, obtained scalar (absolute) size estimates under full cue conditions for rectangular standards that were presented at distances ranging from 1.22 to 3.05 m. Size-estimate reaction times increased linearly with increasing viewing distance. Reaction times for distance estimation were the same at all distances. Exp II, with 16 university Ss, obtained size estimates over distances ranging from 1.22 to 5.49 m under objective and phenomenal size-estimation instructions. Only objective size-estimate reaction times increased with distance. Phenomenal size estimates were faster than objective estimates and were the same for all viewing distances. It is concluded that the cognitive operations involved in objective size estimation were responsible for the effects obtained in Exp I and the similar findings reported in earlier studies by K. O. Broota and W. Epstein (see PA, Vol 51:8222).—*Journal abstract*.

3599. Fucci, Donald J.; Curtis, Ann P. & McCaffrey, Patrick. (Ohio U) **Lingual vibrotactile threshold alterations in response to varying stimulation levels of intensity and duration.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 127-133.—Obtained lingual vibrotactile thresholds at a frequency of 250 Hz by using an ascending-continuous series of stimulation during 5 sessions. Each of 3 adult male Ss attended a control session which included a prescribed period of constant tongue positioning, a preexperimental session where the mean of 6 thresholds was obtained as a basis of further testing, and 3 experimental sessions. In the experimental sessions vibrotactile thresholds after exposure to vibratory stimulation of varying levels of intensity and duration were obtained. Findings of the control session reflect a slight pattern of decreased lingual sensitivity indicative of the influential factor of constant maintenance of tongue positioning. Results from the experimental sessions demonstrate shifts toward progressively decreased lingual sensitivity after exposure to vibratory signals of increased levels of intensity and duration. A recovery phase to near-normal sensitivity followed each stimulus presentation.—*Journal abstract*.

3601. Jamieson, Donald G. & Petrusik, William M. (Carleton U, Ottawa, Canada) **The dependence of time order error direction on stimulus range.** *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 175-182.—In an experiment with 24 undergraduates, the time-order errors found in comparisons of 300-msec duration stimuli reversed direction with changes in within-session stimulus range. With restricted stimulus range, time-order errors were positive while with a very wide stimulus range, time-order errors were instead, negative. With durations near 5000 msec, time-order errors were negative and appeared to be independent of stimulus range. In each case the magnitude of the time-order error tended to decrease with an increase in intersubject interval. Neither existing models of duration perception nor general explanations of time-order errors can account for these effects. (French summary) (16 ref) *Journal abstract*

3602. Jones, Bill. (Carleton U, Ottawa, Canada) **What do Notterman and Page (1962) show? A reply to Notterman.** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 219-220.—J. M. Notterman (see PA, Vol 55:Issue 3) argued, contrary to an article by the present author (see PA, Vol 52:9114), that the data obtained by Notterman and D. F. Page (see PA, Vol 38:1887) confirm the important role of proprioception in skilled performance. It is argued that these data are in fact ambiguous when it comes to distinguishing the effects of proprioception from those of outflow control.

3603. Kameguchi, Kenji. (Kyushu U, Fukuoka, Japan) **[The effects of feedback and postures upon the process of "projection" of positional image.]** (Japan) *Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 76-82.—Attempted to examine the interaction between positional image and action. In the prefeedback phase of the study, blindfolded Ss were instructed to point out 10 times an imagined positional image of a specific part of their body; in the feedback phase, Ss completed the same task in each of 4 1-leg standing postures. It was assumed that the changes of posture, and correct and false feedbacks would have different effects on the process. Results show that (a) positional image was not changed in the ordinal standing posture, while the stability of positional image disappeared in 1-leg standing postures, especially in 2 contralateral postural patterns, and (b) in correct feedback, pointed positional images were closed to the real position. In false feedback, the pointed positional images were more distant from the real position and were closed to the false position except in left ipsilateral postural pattern. 3604. Less, Menaheim; Eickelberg, Warren B. & Cookrish, Neil. (Adelphi U) **Effects of manipulation of augmented knowledge of results and work surface angle on performance of a serial positioning task.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 327-333.—Studied the effects of manipulating augmented information feedback on performance efficiency of 24 18-45 yr old males in a simple motor skill. The 3 levels of information feedback were no augmented knowledge of results, positive augmented knowledge of results, and negative augmented knowledge of results, using light and tone as signal modes. The motor skill was a serial-positioning movement, simulating many industrial as-

sembly tasks, and was given at 3 work surface angles (0°, 9°, and 18°), utilizing an automated geometric work station. Results indicate that, disregarding the signal mode, feedback had no effect on performance. However, when light was utilized as a mode of signal, results were superior at 0° and 18° when positive knowledge of results was provided. Work surface angle had little effect on performance efficiency, the 18° angle being slightly superior to the 0° and 9° angles.—*Journal abstract.*

3605. Ludwig, Arnold M. (U Kentucky, Medical Ctr) **Sensory overload and psychopathology.** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 357-360.—Discusses clinical aspects of sensory overload in man. Comparisons of recent findings on sensory deprivation and sensory overload are presented which suggest that they act in opposite ways on the subjective sense of time, particularly in males. In sensory overload Ss tend to overestimate the passage of time, and in sensory deprivation, Ss tend to underestimate it. "Psychodelic" effects of sensory overload are noted. Compared to normals, schizophrenics appear to function at an optimal level only within a very narrow range of normal sensory stimulation. Psychological adjustment and maladjustment to sensory overload are considered, emphasizing how people in large cities have adapted. (15 ref)—*L. Gorsey.*

3606. Murphy, Brian J.; Kowler, Eileen & Steinman, Robert M. (U Maryland) **Slow oculomotor control in the presence of moving backgrounds.** *Vision Research*, 1975(Nov), Vol 15(11), 1263-1268.—Two experienced and 2 naive Ss were able to use slow control to maintain a steady line of sight for 4.5 sec on a stationary point in the center of a 4° dia field containing a high contrast squarewave grating that moved horizontally at either 5', 48', or 480' /sec. A small influence of the grating movement on drift velocity was observed. It was reduced by more than a factor of 2 when the point was replaced by an annulus. These results were not restricted to brief exposures to the moving grating. Drifts were still largely independent of the background movement after 3 min of exposure. Ss could also switch at will between keeping the eye in place and tracking the moving grating. Results are consistent with the hypothesis that there is a single low velocity eye position control subsystem. It is concluded that the input to this subsystem is determined by choice and attention and not by the nature of the stimulus. (15 ref)—*Journal abstract.*

3607. Notterman, Joseph M. (Princeton U) **Comments on Jones' query: "Is proprioception important for skilled performance?"** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 217-218.—Based in part upon research reported by J. M. Notterman and D. E. Page (see PA, Vol 38:1887), B. Jones (see PA, Vol 52:9114) has argued that the question "Is proprioception important for skilled performance?" should be answered largely in the negative. The earlier study is elucidated, and a conclusion opposite to that of Jones's is drawn.

3608. Smith, Howard V.; Fuller, Raymond G. & Forrest, Derek W. (Trinity Coll, Dublin, Ireland) **Coin value and perceived size: A longitudinal study.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 227-232.—Decimalization of the Irish currency presented an opportunity to study the perceived size of coins as they were

introduced or withdrawn and to examine the accentuation of differences between coins. Estimates were obtained of the sizes of 4 coins from 478 undergraduates in 3 groups tested at different times: just after decimalization or 2 or 3 yrs later. A newly introduced coin was significantly underestimated in size at first but came to be significantly overestimated later, while all familiar coins were always significantly overestimated. The amount of overestimation of a coin depended on its value, not its size, leading to an accentuation of the difference between any 2 coins if the larger coin was also the more valuable but sometimes to the opposite if the smaller coin were of higher value than the larger member of the pair.—*Journal abstract.*

3609. Stang, David J. (Queens Coll, City U New York) **When familiarity breeds contempt, absence makes the heart grow fonder: Effects of exposure and delay on taste pleasantness ratings.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 273-275.—10 female undergraduates tasted and rated for pleasantness small quantities of 15 spices 10 times each in Session I, and 1 wk later (Session II). Ss made 4 additional tastes and ratings of each spice. Pleasantness ratings were a decreasing concave upward function of trials during each session, the decay in pleasantness being more rapid in Session II than in Session I: Initial trials in both sessions did not differ in rated pleasantness. Results suggest that some satiation effects dissipate with time while others are cumulative.—*Journal abstract.*

3610. Williams, L. R. & MacFarlane, D. J. (U Otago, School of Physical Education, Dunedin, New Zealand) **Reaction time and movement speed in a high-velocity ball-catching task.** *International Journal of Sport Psychology*, 1975, Vol 6(2), 63-74.—A ball-throwing machine was used to test the reaction time (RT) and movement time (MT) of 30 Ss. 4 velocities (57, 65, 84, and 123 mph) were used. In comparison to control conditions, RT decreased significantly while MT increased. Data are interpreted as demonstrating that Ss learned to anticipate as the velocities increased. Catching ability deteriorated with the increases in velocity and was explained in terms of the interaction of the RT and MT components of the response with the total ball-flight time. The low reliability coefficients found for ball-velocity and accuracy were found to be of no practical hindrance in conducting the experiment. (17 ref) *Journal abstract.*

3611. Wilsoncroft, W. E. & Stone, Jeffrey D. (California State U, Northridge) **Information processing and estimation of short time intervals.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 192-194.—Assessed duration estimates by the method of reproduction with filled reproduction intervals. Mental arithmetic, reading, and mirror-image drawing were used in pairs as initial and/or reproduction tasks. All 9 possible pairs of tasks were used in a 9 × 5 × 5 mixed design with 5 Ss/task pair and 5 interruption intervals for each initial task. Results indicate that, when arithmetic was used as the initial task, Ss underestimated the duration of the initial interval. When arithmetic was used as the reproduction task, Ss overestimated the duration of the initial interval. A significant correlation was obtained between arithmetic outputs and the length of the duration estimates. Results are interpreted as supportive of W. Burnside's

(1971) interpretation of R. E. Ornstein's (1969) storage-size hypothesis.—*Journal abstract.*

3612. Wrisberg, Craig A. (Virginia Polytechnic Inst & State U) **A note on motor learning without post-response knowledge of results.** *Journal of Motor Behavior*, 1975(Sep), Vol 7(3), 221-225.—The common conclusion that some form of extrinsic postresponse error information is necessary in order for Ss to acquire a criterion motor response was contradicted in an experiment using a linear positioning task. Findings are discussed in terms of recent theoretical positions by J. A. Adams (see PA, Vol 48:2177) and R. A. Schmidt (1975).

3613. Yairi, Ehud & Cavaness, Denise. (Texas Tech U) **Successive versus simultaneous presentation on forms in oral stereognostic testing.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 233-234.—2 forms of 55 pairs of plastic forms were orally presented 1 at a time to a group of 30 adults at 5-sec intervals and to 30 other adults simultaneously. The latter Ss made significantly more errors, particularly between classes of forms.—*Journal abstract.*

3614. Yen, Wendy M. (CTB/McGraw-Hill, Monterey, CA) **Independence of hand preference and sex-linked genetic effects on spatial performance.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 311-318.—Compared separately the paper-and-pencil spatial performances of right- and left-handed high school students for 1,236 males and 1,241 females. Handedness differences in favor of right-handed Ss were found among males only. Analysis of data for a subgroup of 555 Ss indicated that handedness and sex-linked genetic effects acted independently and additively on spatial performance. (18 ref)—*Journal abstract.*

3616. Anderson, Nancy S.; Pine, Steven M. & Rosenfield, Azriel. (U Maryland) **Derived scales for degree of simultaneous contrast in six Benussi ring figures.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 289-292.—Gestalt psychologists have explained the reduction of simultaneous contrast in the Benussi ring figure as a result of laws of mental organization (i.e., "good continuation"). The present study investigated the properties of these laws by studying 6 variations of the basic Benussi figure, which varied with respect to the type of boundary used to divide the ring. Scale values related to the dimension of degree of simultaneous contrast were derived using the method of paired comparisons. Data from 88 undergraduates support an explanation based on apparent separation between parts of the figure and degree of figure-ground symmetry rather than good continuation.—*Journal abstract.*

3617. Battro, Antonio M.; Mazzotti, Tarso B. & Cabral, Reinaldo J. (Ctr de Investigaciones Filosoficas, Buenos Aires, Argentina) **[Toward a psychophysical urban scale.]** (Fren) *Année Psychologique*, 1975, Vol 75(1), 147-152. Studied the reactions of 120 Ss who first observed public squares of various sizes, then, in a

large field, staked out the estimated perimeter of the observed square. Underestimation increased with size of square. For areas less than 2,000 m square, 20 Ss overestimated and 48 overestimated size, and individual responses showed a characteristic variation. For areas greater than 2,000 m square all Ss except one underestimated size. Cognitive processes in large-scale estimation remain relatively neglected.—G. Rubin-Rabson.

3618. Burt, Peter J. (U Massachusetts, Amherst) **Computer simulations of a dynamic visual perception model.** *International Journal of Man-Machine Studies*, 1975(Jul), Vol 7(4), 529-546.—Argues that perception should be regarded as a dynamic process in which patterns of neural activity are developed and which change in ways which reflect changes in the visual field. A model is described to suggest how the visual system may keep track of perceived objects as their images move on the retina. It is postulated that at some level of the visual system, the position of these objects relative to the observer is represented by a pattern of neural activity. Such a pattern of activity must move as a unit as the object it represents moves: the pattern cannot be continually regenerated during motion. In the model, information is represented by activity in 2-dimensional homogeneous layers of neuron-like elements. Object velocity, which cannot be directly sensed at the level of the retina, is isolated and represented analogically. This representational isolation of object- and observer-related velocity is used to explain several illusions of motion perception, including induced motion and the "waterfall effect."—*Journal abstract.*

3622. Dev, Parvati. (Neurosciences Research Program, Boston, MA) **Perception of depth surfaces in random-dot stereograms: A neural model.** *International Journal of Man-Machine Studies*, 1975(Jul), Vol 7(4), 511-528.—Presents a model which segments the visual field into spatially disjoint regions, each region characterized by a specific feature such as a texture or color. The neural connectivity hypothesized to be necessary is formulated in mathematical terms, and the corresponding neural network simulated on the digital computer. The properties of the network that result from the postulated patterns of excitatory and inhibitory connectivity are investigated. It is shown that the required connectivity is that of excitatory connections only between neurons detecting similar features, and inhibitory connections between all feature-detecting neurons. The model explains the phenomenon of stereopsis as investigated through the use of random-dot stereograms. The process of depth perception through stereopsis is viewed as a segmentation process with each segment characterized by a specific retinal disparity. It is shown

that the model suffices to detect the different depth surfaces embedded in the random-dot patterns.—*Journal abstract.*

3623. Didday, Richard L. & Arbib, Michael A. (U California, Information Sciences, Santa Cruz) **Eye movements and visual perception: A "two visual system" model.** *International Journal of Man-Machine Studies*, 1975(Jul), Vol 7(4), 547-569.—Notes that eye movement is one of the few externally measurable activities of visual perception, providing a checkpoint for models of perceptual processes. In the present paper, the authors' model (1971) is compared with that of D. Noton and L. Stark (1970, 1971), and is found to predict the same behavior but without requiring explicit storage of eye movement commands. (35 ref)—*Journal abstract.*

3624. Doehrmann, Steven. (U Michigan, Inst for Human Adjustment) **Superiority of recognition over detection in judgments of visual orientation.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 179-184.—Tested 2 human female Ss in 2 separate visual psychophysical tasks, detection and recognition. Using tachistoscopic presentation, single lines were shown at 5 different exposure durations. It was determined that it is easier to judge which of 2 lines, differing only in orientation, was flashed than to judge whether or not a given line was presented. The statistically significant superiority of recognition over detection occurred along a wide performance range, roughly 60-90% correct. Data indicate that the effect is not peculiar to a simultaneous detection-recognition task or to a midrange performance level, both of which were used in a previous study. Other relevant data and theoretical explanations of the effect are discussed.—*Journal abstract.*

3625. Emerson, Phillip L. & Semmelroth, Carl C. (Cleveland State U) **Filter model for lightness and brightness on different backgrounds.** *Journal of the Optical Society of America*, 1975(Oct), Vol 65(10), 1101-1105.—Proposes a filter model to account for the effects of background luminance on perceived brightness or lightness of a target area. Special attention is focused on a crispening effect describable as a local increase of the rate of change of brightness with target luminance, as target luminance passes through the level of background luminance. The model is based on the assumption of competition, in the form of mutual-shunting-feedback inhibition, between target and surround. (39 ref)—*Journal abstract.*

3626. Epstein, Sheldon. (New York U, School of Engineering & Science) **A study in visual persistence.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 893.

3627. Finlay, D. C. & Caelli, T. M. (U Newcastle, Australia) **The Poggendorff Illusion and estimates of transverse extent.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 143-148.—Tested the underestimation of transverse extent relative to longitudinal extent, in the Poggendorff Illusion, by varying oblique line orientation, interparallel line distance, and presence or absence of obliques. 20 Ss made estimates of the transverse extent on both a longitudinal and transverse extent. Results indicate that, although underestimation was found for some stimulus conditions, overestimation was found for others. It is argued that, even though presence of

obliques affected judgmental error, the longitudinal-transverse illusion could not form a basis for the Poggendorff Illusion. (15 ref)—*Journal abstract.*

3628. Fudin, Robert; Garcia, Margarita & Solomon, Nathan A. (Long Island U) **Identification of tachistoscopically exposed symmetrical and asymmetrical letter arrays.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 103-106.—6-letter arrays containing symmetrical (e.g., H, M, T, or asymmetrical letters, e.g., J, K, R) were tachistoscopically exposed bilaterally for 100 msec to 100 college students. Significantly more asymmetrical than symmetrical letters were identified, and significantly more Ss identified more asymmetrical than symmetrical items. This experiment, which incorporated methodological considerations suggested by E. R. Harcum (see PA, Vol 39:11134) and M. P. Bryden (see PA, Vol 43:8983), corroborates their findings. Their ideas and other findings were used to account for the data. Asymmetrical letters have more intrinsic left-to-right directionality than symmetrical elements. The rapidly fading after-stimulation of tachistoscopically presented alphabetical material is usually scanned from left to right. Individual array letters might also be scanned in the same direction. Confluence of directionality of letter and scan, which obtains only with asymmetrical letters, might have typically allowed asymmetrical targets to be scanned more rapidly and, consequently, more efficiently than symmetrical displays.—*Journal abstract.*

3629. Götz, Karl O. & Götz, Karin. (Academy of Fine Arts, Düsseldorf, W Germany) **Color preferences of art students: Surface colors: II.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 271-278.—In a previous study by the present authors (see PA, Vol 53:10832) the preferences of 14 surface colors were analyzed. While this set contained only 1 red, 1 blue, 1 yellow, etc, the color set of the present investigation was extended, and the preferences of 5 different reds, blues, yellows, etc were analyzed. Ss were 113 male and 77 female academy of arts students. Between the 5 variations of red and yellow, respectively, the greatest affective differences were found, while the opposite was true for the 5 oranges, pinks, and grays. The most preferred colors are 2 reds, 2 blues, and 2 yellows; least preferred are a greenish yellow, a penetrating red-violet, and all 5 pinks. Significant sex differences were found for 8 colors.—*Journal abstract.*

3631. Hatta, Takeshi. (Osaka U of Education, Japan) **[Functional hemispheric asymmetry in perception of random forms.]** (Japn) *Japanese Journal of Psychology*, 1975(Aug), Vol 46(3), 152-161.—Conducted 2 experiments in which a total of 30 Ss made "same-different" judgments with respect to a pair of random forms which were serially presented to the right and left visual fields (VF) tachistoscopically. In Exp I, the stimulus materials were solidly painted random forms, and in Exp II they were contour forms. Results of both experiments indicate that the right VF-lead condition produced more errors

than the left VF-lead condition, and that the high complexity form group produced more errors than the low complexity form group. The tendency of left VF-lead superiority was more pronounced when the interval between the 2 stimuli was longer. Findings suggest the possibility of the right hemisphere's superior function concerning the perception of random forms. (24 ref)—*English abstract*.

3632. Hennessy, Robert T. (Human Factors Research, Goleta, CA) **Instrument myopia.** *Journal of the Optical Society of America*, 1975(Oct), Vol 65(10), 1114-1120.—Conducted 3 experiments with a total of 43 18-32 yr old emmetropes to investigate the basis for instrument myopia, the tendency to accommodate inappropriately while viewing through an optical instrument. Exp I demonstrated that the distance of a peripheral surround, analogous to a field stop, influences accommodation but that the magnitude of the effect cannot account for instrument myopia. Exp II reexamined the hypothesis that perceived distance can affect accommodation. Data indicate that perceived distance is unlikely to influence accommodation and does not provide an explanation of instrument myopia. Exp III tested the hypothesis that instrument myopia is a manifestation of the return of accommodation to an intermediate state of rest or equilibrium in the absence of an adequate stimulus for accommodation. Implications of the intermediate-resting-state hypothesis are discussed. (33 ref)—*Journal abstract*.

3633. Jaeger, Ted. (U Georgia) **Effects of changes in fin-length on apparent shaft-length and depth in the Müller-Lyer illusion.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 79-84.—Back-illuminated Mueller-Lyer figures with outgoing fins, and 20 undergraduates judged both apparent shaft length and depth. With the angle between the fins constant, progressive increases in fin length produced first an increase in the apparent shaft length and then a decrease. Changes in fin length, however, had no significant effect on apparent depth. Data are interpreted as inconsistent with an account of the Mueller-Lyer illusion in terms of perspective theory, since the latter predicts systematic changes in perceived shaft length to be associated with systematic changes in perceived depth. (18 ref)—*Journal abstract*.

3634. Jones, Paul D. & Wilkinson, Hilde. (U Louisville) **Latency differences to monochromatic stimuli measured by disjunctive reaction time.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 55-59.—Conducted 2 studies to assess the effects of wavelength on visual perception latency as measured in a disjunctive reaction time (RT) paradigm. Results of Exp I, employing 4 adults with normal color vision, though not statistically significant, suggested a trend toward shorter RT to longer wavelength stimuli. In Exp II, using well-practiced adults, significant differences were found between disjunctive RT to red and green stimuli. Results suggest that latency differences as a function of wavelength are demonstrable in an experimental situation in which the S must react to chromatic information, as differentiated from brightness information.—*Journal abstract*.

3635. Jones, Robert M. & Tulunay-Keese, U. (U Wisconsin, Medical Ctr, Madison) **Local retinal adaptation and spatial frequency channels.** *Vision Research*,

1975(Nov), Vol 15(11), 1239-1244.—Results of an experiment, which assessed the effects of human Ss of local retinal adaptation by maximizing and minimizing it through stabilizing the adaptation and test gratings, indicate that local retinal adaptation is not the cause of spatial frequency tuned channels.

3636. Kitterle, Frederick L. & Leguire, Lawrence E. (U Toledo) **The effects of borders and contours on threshold during early dark adaptation.** *Vision Research*, 1975(Nov), Vol 15(11), 1217-1224.—Conducted 4 experiments with the 2 authors and an additional adult as observers to investigate whether the drop in threshold during early dark adaptation was due to activity with a receptor or whether the drop in threshold reflected the decay of activity extending over a lateral spatial region. Results show that conditions maximizing lateral effects increased the magnitude of the drop in threshold during early dark adaptation; and that spatial integration of light rapidly changed during the course of early adaptation. It is concluded that early dark adaptation reflects a mechanism sensitive to the spatial distribution of light and consequently rules out an interpretation of early dark adaptation as a process arising solely within a receptor. It is argued that the mechanism responsible for these changes may not be retinal. (25 ref)—*Journal abstract*.

3637. Kitterle, Frederick L.; Leguire, Lawrence E. & Riley, John A. (U Toledo) **The effects of target orientation on threshold during early dark adaptation.** *Vision Research*, 1975(Nov), Vol 15(11), 1294-1296.—Experimental results in human Ss support the hypothesis that changes in the spatial integration of light during early dark adaptation may reflect changes in the activity of cortical channels which respond to spatial frequency.

3638. Kubovy, Michael & Tzelgov, Joseph. (Yale U) **A test of Vitz and Todd's model of the judged complexity of straight-line figures.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 186-190.—Conducted an investigation with 10 undergraduates. 2 sets of stimuli, each consisting of 9 geometric patterns, were computer-generated: in 1 set, the patterns were squares which were partitioned randomly into rectangles; in the other, the patterns were squares which were partitioned randomly into polygons. Ss gave magnitude estimates of the complexity of the stimuli. The index of complexity of P. C. Vitz and T. C. Todd (see PA, Vol 46:Issue 4109) was not a consistently better predictor of estimated complexity than the ratio of the number of lines in each pattern to an index of symmetry. Moreover, the power function relating the complexity estimates of the rectangular partitions to the Vitz and Todd index was significantly different from the power function relating the complexity of the polygonal partitions to the Vitz and Todd index. It is concluded that the Vitz and Todd model requires major additional assumptions in order to be a candidate for a process model of pattern perception.—*Journal abstract*.

3639. Leibowitz, H. W. & Owens, D. A. (Pennsylvania State U) **Night myopia and the intermediate dark focus of accommodation.** *Journal of the Optical Society of America*, 1975(Oct), Vol 65(10), 1121-1128.—The phenomenon of night myopia, the tendency to overaccommodate for distant objects as luminance is decreased, results

from the passive return of accommodation to an individually determined intermediate resting or dark focus. More generally, accommodation is viewed as a compromise between the S's individual resting focus and the accommodative stimulus. Under optimum viewing conditions, accommodation tends to correspond to the distance of the stimulus, but is biased progressively toward the dark focus as the adequacy of the accommodative stimulus is degraded by decreased luminance. 4 control experiments were conducted, 3 which employed a total of 59 normally seeing undergraduates and one which used 4 myopic, emmetropic, and 2 hyperopic adults. Results suggest that optical aberrations are not major factors which contribute to night myopia. (28 ref) —*Journal abstract.*

3642. Makino, Tatsuro. (Waseda U, Tokyo, Japan) **Comparison process as a factor of size-distance relationship.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 104-109. —Considers how 2 stimuli presented at different distances compare with each other and how the degree of size-constancy is determined by the matching method. "Mental slide" and "mental sliding" are considered in comparing the 2 stimuli presented at different distances. Both the gradient of mental slide and the mental sliding distance determine the degree of size-constancy. A formula is suggested which predicts both the degree of size-constancy by the matching method and a size-distance relationship. —*Journal abstract.*

3643. Matin, Ethel. (Long Island U, C. W. Post Ctr) **The two-transient (masking) paradigm.** *Psychological Review*, 1975(Nov), Vol 82(6), 451-461. —Discusses the logic of masking experiments and other experiments employing a similar temporal paradigm. Contrary to the usual theoretical assumptions, it is suggested that 3 classes of neurons could be responding, at least in some cases, to the 2 stimuli presented in such experiments. The 1st of these consists of neurons stimulated by the target, and the 2nd consists of neurons stimulated by the mask (or other inducer). Neurons of the 3rd class respond minimally, if at all, to either of these stimuli alone, but are fired by their combined presentation at appropriate temporal intervals. The possibilities for thinking with this additional degree of freedom are illustrated with visual lateral masking. Some specific points considered are the effects the postulated 3rd class of neurons could have on the temporal properties of metacontrast, the possible role of these neurons in producing a strong metacontrast and a weak paracontrast, and the relation they could have to the well-known correlation between apparent movement and masking. It is suggested that some members of the 3rd class could be involved in the sensation of motion. Others, tuned to a broad range of velocities including

some very high ones, could be involved in saccadic suppression and visual masking. (2 p ref) —*Journal abstract.*

3645. Mikaelian, H. H. (U Georgia) **Movement-induced modulation of orientation-specific color after-effects.** *Perception & Psychophysics*, 1975(Aug), Vol 18(2), 172-174. —Conducted an experiment in which the intensity of the McCollough effect was modified when, following exposure to the inducing chromatic stimuli, the achromatic test gratings were seen oscillating orthogonally to their orientations. 20 Ss with normal color vision participated. Green aftereffect seen on stationary test gratings was enhanced by oscillations, while pink aftereffect present on the stationary gratings faded upon oscillation of the test stimulus. These opponent changes are tentatively accounted for in terms of an interaction between Fechner-Benham type induced color and processes that mediate the orientation-specific chromatic aftereffects. —*Journal abstract.*

3646. Monk, Timothy H. & Brown, Brian. (MRC Applied Psychology Unit, U Sussex, Brighton, England) **The effect of target surround density on visual search performance.** *Human Factors*, 1975(Aug), Vol 17(4), 356-360. —In an earlier study (1975), the authors defined the area of display immediately adjacent to the target to be the "target surround." Using highly specific configurations of nontargets in the target surround, they showed that congested target surrounds act to camouflage the target. The present 2 experiments, with 16 normally seeing psychology students, tested these results under more general conditions where no specific configurations were enforced. A linear increasing function was found between geometric mean search time and target surround density, using 3 measures of the latter. The implication of this result to studies of overall nontarget density is discussed. (21 ref) —*Journal abstract.*

3647. Moulden, Bernard. (U Reading, England) **Eye movements and the movement after-effect.** *Vision Research*, 1975(Oct), Vol 15(10), 1169-1170. —Discusses 3 possible ways in which the differential sensitivity to movement in a particular direction (movement aftereffect, which occurs as a result of prolonged exposure to movement in that direction) might manifest itself when a stationary stimulus is subsequently viewed. Experimental data are reported which show that eye movement-generated retinal image movements do not constitute a necessary condition for the production of a movement aftereffect.

3650. Osaka, Naoyuki. (Kyoto U, Japan) **Target size and luminance in apparent brightness of the peripheral**

visual field. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 49-50. 4 target sizes between 15 and 120 min of arc with 6 luminance levels covering the range between 398.1 and 1.26 cd/m² in steps of 0.5 log units were presented to 0, 20, 40, 60, and 80° nasal retinal loci. In both peripheral and foveal viewing, magnitude estimates to apparent brightness judged by 12 graduate students changed as a function of target size and luminance. The exponent of the power function was not dependent on retinal loci but on target size. However, when target size increased, the apparent brightness was slightly greater with peripheral viewing than with foveal viewing.—*Journal abstract.*

3651. Owens, D. A. & Leibowitz, H. W. (Pennsylvania State U) **The fixation point as a stimulus for accommodation.** *Vision Research*, 1975(Oct), Vol 15(10), 1161-1163.—Experimental data in undergraduate observers imply that the accommodative response to a small luminous stimulus was determined primarily by the particular S's resting focus rather than by the stimulus distance, consistent with H. A. Schober's (1954) intermediate resting focus hypothesis. (21 ref)

(Foster Grant Co, Leominster, MA) **Recognition of traffic signals viewed through colored filters.** *Journal of the Optical Society of America*, 1975(Oct), Vol 65(10), 1106-1113.—Experimental results provide an empirical basis for establishing color standards for sunglasses. It is stressed that limits should be set for both apparent color shift and reduction of apparent luminosity as seen through the lens.

3653. Potts, M. J. & Harris, J. P. (U Bristol, Medical School, England) **Movement aftereffects contingent on the colour or pattern of a stationary surround.** *Vision Research*, 1975(Nov), Vol 15(11), 1225-1230.—Cites studies which have shown that movement aftereffects (MAEs) contingent on several visual dimensions, such as color, texture, luminance, or depth, can be obtained from suitable stationary test fields if the appropriate characteristics of the moving stimulus are varied during adaptation. In the present 4 experiments with a total of 19 Ss, contingent MAEs were obtained from an adaptation paradigm in which only the direction of movement of a moving stimulus was changed while the color or pattern of a surrounding stationary area was varied. Stationary test fields then elicited MAEs contingent on the color or pattern of their surround. (29 ref)—*Journal abstract.*

3654. Rogers, Steven P. & Gogel, Walter C. (U California, Santa Barbara) **Relation between judged and physical distance in multicue conditions as a function of instructions and tasks.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 171-178.—Using a rod adjustable in distance, 48 undergraduates produced equal depth intervals along a floor of a visual alley (interval reproduction) or bisected a given depth interval into 2 equal parts (bisection). Also, verbal reports were obtained of a depth interval located at a near and farther distance from observer (absolute judgments). 2 kinds of instructions, "apparent" and "objective," were used with different observers with each of the 3 tasks. There was an overall tendency ($n = .05$ on 2 of 3 tasks) for apparent instructions to produce less overconstancy or more

underconstancy of distance than that produced by objective instructions. This tendency is consistent with a cognitive interpretation of overconstancy of distance. Clear overconstancy was obtained only by the combination of objective instructions and the bisection task. Clear underconstancy was obtained only by the combination of apparent instructions and the method of absolute judgments. The reason for the effect of task on magnitude of distance constancy is not understood.—*Journal abstract.*

(U Western Australia, Perth) **The Pulfrich effect and short-term memory in stereopsis.** *Vision Research*, 1975(Nov), Vol 15(11), 1289-1290.—Experimental results in human Ss (a) confirm B. Julesz and B. White's (1969) finding that delay in vision's response to a light source, caused by filtering or attenuating the light, is the proper explanation for the Pulfrich phenomenon, (b) give an estimate of delay for a 1-log unit filter, and (c) confirm the authors' (see PA, Vol 53:6573) finding concerning memory effects.

3656. Scanlon, L. A. (Hughes Aircraft, Culver City, CA) **Visual time compression: Spatial and temporal cues.** *Human Factors*, 1975(Aug), Vol 17(4), 337-345.—Research by J. D. Moll and L. A. Scanlon (1972) and by L. A. Scanlon et al (1971) has demonstrated the improved target detection performance resulting from the coherent motion cues provided by a visually time-compressed radar display. As the detection task becomes more difficult because of increased noise and clutter, the improvement due to time compression increases. The results further indicate that, if the spatial aspect of the target could also be enhanced, additional target detection improvement might be realized. The present study, with 24 paid university students, compared target detection performance on a standard time-compressed display with performance on 2 displays that provided both spatial and temporal target cues. A 4th display providing primarily spatial cues was also included in the comparison. Results indicate that the addition of spatial cues improves the detectability of a target under conditions of high noise and that at least 5 frames of storage are required for best performance.—*Journal abstract.*

3659. Skavenski, Alexander A.; Robinson, David A.; Steinman, Robert M. & Timberlake, George T. (North-eastern U) **Miniature eye movements of fixation in rhesus monkey.** *Vision Research*, 1975(Nov), Vol 15(11), 1269-1273.—Recorded 2-dimensional eye movements from 4 juvenile male monkeys during training on 2 tasks aimed at showing they were capable of as accurate fixation control as man. Extensive training on a difficult acuity-vigilance problem caused only 3 Ss to occasionally fixate the display for periods over 10 sec with stability of eye position comparable to man. Changing the task

numbers of long fixations and produced human-like fixation stability in all 4 Ss. It is concluded that monkeys, like man, used slow control to maintain fixation. (17 ref) —*Journal abstract.*

3660. Tolhurst, D. J. (U Cambridge, Physiological Lab, England) **Sustained and transient channels in human vision.** *Vision Research*, 1975(Oct), Vol 15(10), 1151-1155.—The sensitivity for 4-msec flashes of sinusoidal grating was determined at various times during and after a subthreshold 800-msec flash of grating of the same spatial frequency. The author served as observer. At frequencies of 2 c/deg and below, the sensitivity to the short flash was transiently changed for about 100 msec after the onset and offset of the long flash. If the gratings in the long and short flashes were spatially in phase, the sensitivity to the short flash was increased at the onset of the long flash but was decreased at the offset. A phase-shift of 180° caused an inversion of these effects. At higher spatial-frequencies, the sensitivity to the short flash was increased to a new steady level for the duration of the long flash, when the gratings were in phase. A phase-shift of 180° did not cause an inversion: the sensitivity was changed transiently at the onset and offset of the long flash. The results can be explained by supposing the existence of 2 types of channel at these spatial-frequencies.—*Journal abstract.*

3661. Tolhurst, D. J. (U Cambridge, Physiological Lab, England) **Reaction times in the detection of gratings by human observers: A probabilistic mechanism.** *Vision Research*, 1975(Oct), Vol 15(10), 1143-1149.—Reaction times (RTs) were measured in 1 observer (the author) for sinusoidal gratings which were flashed on with various temporal waveforms. The contrast was close to threshold. At low spatial-frequencies, RTs were grouped just after any sudden transient in the stimulus, even when this was at the end of the stimulus. At higher spatial-frequencies, RTs were not related to the time of sudden changes in contrast but were distributed throughout the body of the stimulus; the longer the stimulus duration, the greater was the chance that the stimulus would be detected. Results can be explained if a stimulus can be detected at any time when the visual system's response to it is moderately high and not simply at the time when the response is greatest. At low spatial-frequencies, the channels have transient step-responses; at higher frequencies, the responses are sustained. (15 ref) —*Journal abstract.*

3662. Tynan, Paul & Sekuler, Robert. (Northwestern U, Cresap Neuroscience Lab) **Simultaneous motion contrast: Velocity, sensitivity and depth response.** *Vision Research*, 1975(Nov), Vol 15(11), 1231-1238.—Conducted 3 experiments with 3 naive and 1 experienced paid adult Ss in which a center and surround of spatially random dots were used to study the effect of surround motion on the center's (a) perceived velocity, (b) perceived depth, and (c) visibility. The velocity of the surround influenced the center's velocity and depth in similar, complex ways. However, surround speed had no effect on the luminance detection threshold of the center dots. Results with these dependent measures bear on theories of motion perception and on processing in other sensory domains. (32 ref)—*Journal abstract.*

3665. Berkhout, Jan. (U South Dakota) **Test-retest stability of auditory flutter perception using synthetic stimuli.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 341-349.—Describes a method for determining the auditory flutter fusion threshold which is well suited for human-performance field studies. The technique, which uses paired comparisons, is relatively portable, easy to administer and score, and apparently stable within the 6-min subtest time frame.

3666. Cole, Ronald A.; Cooper, William E.; Singer, Joel & Allard, Fran. (Carnegie-Mellon U) **Selective adaptation of English consonants using real speech.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 227-244.—Most English consonant-vowel (CV) syllables have other CV syllables embedded within them. In 9 experiments with a total of 132 college students successively longer segments were spliced from naturally spoken CV syllables to produce sequences of CV syllables which varied in discrete acoustic steps. Random presentation of syllables in each series resulted in identification functions with typically sharp phoneme boundaries. Following the identification test, Ss listened to 180 repetitions of either the 1st or last syllable in the test series and were again required to identify randomly presented syllables from the test series. A shift in the phoneme boundary toward the repeated (adapting) syllable was observed for 11 of the 12 repeated syllables. Adaptation was selective in that syllables near the phoneme boundary were most affected by the adapting syllable. A shift in the phoneme boundary was also observed for 2 different continua when the adapting stimulus contained an acoustic feature identical to syllables in the test series. A 2nd major result was an asymmetrical adaptation effect. A greater shift in the phoneme boundary was observed following repeated presentation of the 1st syllable in each series than for the final embedded syllable. Results are discussed in terms of 2 different models of selective adaptation. (20 ref) —*Journal abstract.*

3667. Deutsch, Lawrence J. (Queens Coll, City U New York) **Auditory sensitization in the human stapedius reflex.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 301-304.—Reports results of 3 experiments with a total of 25 normal-hearing young adults, which demonstrated that the threshold of the acoustic reflex decreased following white noise stimulation. Sensitization was

evident following relatively intense stimulation for an extension period and even following short bursts of moderate intensity.

3669. Foulke, Emerson & Lass, Norman J. (U Louisville) **The effect of oral reading skill on the comprehension of time-compressed speech.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 297-300.—Reports results of an investigation into the effect of oral reader skills on the comprehension of time-compressed speech. An analysis of variance revealed that comprehension of 480 listeners to selections of the Nelson-Denny Reading Test at 175, 225, 275 and 325 words/min did not vary systematically with the experience and reading skills of the reader nor with the reader's sex.

3670. Hartley, Harold V. & Hetrick, R. Dennis. (Clarion State Coll) **Ambiguities in visual identification of responses in respiration audiometry.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 305-311.—Reports experimental results with 5 normal-hearing young adults. Results indicate that judges can be trained to a high level of agreement as to the presence or absence of a wave-form variation, but the fact that an unacceptably high number of these variations occurred in the absence of any auditory stimuli makes the method's clinical utility questionable.

3671. Hendrickson, A. E. & Hendrickson, D. E. **An auditory illusion predicted by a theory of brain function.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 279-289.—A theory of brain function has resulted in the hypothesis that dichotic auditory stimuli of differing intensities would be subjectively heard to occur at different times if presented together. The louder of the 2 tones would always be heard first. Results of an experiment designed to test the hypothesis have established that the predicted illusory judgment will invariably be made. Ss were 3 teenage boys and a female in her early 20's. The further prediction that the magnitude of the effect would closely parallel certain reaction time data was substantiated. It seems reasonable to conclude that the same paradigm must underlie both sets of data. The theory and results provide a possible neurophysiological basis for the perception of rhythm. A review of the literature has shown that results analogous to those reported here have previously been reported for the visual and tactile modalities, as would be predicted from the general considerations of the theory which gave rise to the specific hypotheses tested in this experiment.—*Journal abstract.*

3672. Leventhal, Gloria. (William Patterson Coll, Wayne, NJ) **The effect of category set on auditory word recognition.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 313-319.—Tested the ability of 10 normal-hearing Ss to perceive words presented in noise with an appropriate semantic category given before the stimulus (Pre), after the stimulus (Post), or not at all (Control). Results showed that $P(C/Post) > P(C/Pre) = P(C/Control)$, where $P(C)$ —probability of a correct response—is the measure of intelligibility. (28 ref)

3673. Pastore, Richard E. et al. (State U New York, Binghamton) **Discrimination of intensity differences on formant-like transitions.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 224-226.—M. F. Dorman (see PA, Vol 53:2223) studied the discrimination of intensity differences on formant transitions in and out of syllable context. He interpreted his results as suggesting that the acoustic features of his stop-consonant-vowel syllable were recoded into a phonetic representation, then stored in an inaccessible form of auditory short-term memory. The Dorman results were replicated with analogous pure-tone and FM-glide conditions, using 7 normal-hearing adults, 6 of whom were experienced as psychoacoustic listeners, as Ss. Results of both studies are explained in terms of specified acoustic properties of the signals and thus provide no evidence for a special phonetic recoding.—*Journal abstract.*

3674. Perrott, David R. & Briggs, Renee. (California State U, Los Angeles) **Effects of apparent motion of the masker upon the binaural masking function.** *Journal of Auditory Research*, 1973(Oct), Vol 13(4), 328-332.—Reports results of 2 experiments with 5 normal-hearing experienced and naive young adults. Results parallel those of P. Kolars (1963) on visual masking with apparent movement maskers. In both studies, the changes in perceived spatial relationships between masker and target invoked by the apparent movement effect generated no concomitant change in the masking function.

3675. Perrott, David R.; Brooks, Richard & Fobes, James L. (California State U, Los Angeles) **Instability of auditory perceptual experience: II. Reports of spontaneous shifts in pitch loudness and locus.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 220-223.—In 2 experiments, a total of 71 naive college students and young adults consistently reported detecting spontaneous shifts in apparent locus, pitch, and loudness of pure tones in the absence of objective stimulus changes in 10-min sessions. While a number of task and stimulus variables were manipulated, no explanation for these effects is suggested at the present time.—*Journal summary.*

3676. Redden, Robert B. (Boston U, School of Education) **The effects of frequency compression and transposition on the intelligibility of monosyllabic words in normal hearing listeners.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1601.

3680. Ward, Lawrence M. (U British Columbia, Vancouver, Canada) **Sequential dependencies and response range in cross-modality matches of duration to loudness.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 217-223.—10 college students matched durations of keypresses to loudnesses of pure tones. Resulting duration responses were found to be assimilated to the value of the immediately preceding stimulus and responses from 1 to at least 6 trials back in the sequence of loudness stimuli. Responses were contrasted with the values of stimuli 2-6 trials back in the sequence. These sequential dependencies and other properties of the data were predicted by a cognitive model in which cross-modality matches are mediated by category judgments of stimuli on both continua, and Ss use heuristic strategies to reduce response uncertainty. (19 ref)—*Journal abstract*.

Cognitive Processes

3681. Alexander, Ernest R. (U Wisconsin, Milwaukee) **The limits of uncertainty: A note.** *Theory & Decisions*, 1975(Aug), Vol 6(3), 363-370.—Posits that discussions of decision making by individuals and organizations invariably touch on the issue of uncertainty. Decision theory axiomatizations are based on the assumption that uncertainty cannot be unlimited, but that there must exist a minimal interval of value stability. The present paper makes explicit that assumption for individual choice. For group and organizational decision making, a proof is presented which deduces a limit to uncertainty from the existence of deliberate social action. (23 ref)—*Journal abstract*.

3682. Bensch, R. & Schuster, M. (U Köln, Pädagogisches Seminar, W Germany) **[The dependence of concept formation on experience.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 181-195.—Attempted to determine which properties of a stimulus pool are relevant for concept formation. The number of drawings in a group of drawings of men, and characteristics of the drawings, were varied systematically. Ss had to decide if a drawing differing slightly from the rest still belonged to that group. It was found that the number of drawings as well as their characteristics significantly influenced these decisions. With increasing numbers of drawings a more tolerant and a broader concept formation resulted. Findings are discussed within the framework of F. Klix's theory of concept formation. —*English summary*.

3683. Bierhoff, Hans W. (U Bonn, Psychologisches Inst, W Germany) **[Cognitive representation of alternative actions in their relation to positive and negative outcomes.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 131-146. 88 11th and 12th graders participated in a study to demonstrate the cognitive representation of propositions derived from exchange theory. Starting with a logical model of the theory, 3 hypotheses were derived concerning the preference for social actions in everyday situations. The situations made 2 alternatives

of action salient and Ss were required to make probability estimates under these circumstances. Hypothesis 1 claimed that the preference for one alternative of action can be predicted by the conditional probability of this alternative (given that positive outcomes occur). This was confirmed. Hypothesis 2, concerning the structuring of relevant cognitions, was also supported, indicating that Ss with higher structuring of cognitions are more predictable on the basis of Hypothesis 1. There were no differences in the direction of Hypothesis 3: "Optimistic" and "pessimistic" Ss did not differ in their predictability. (15 ref)—*English summary*.

3684. Burgoyne, John G. (Lancaster U, Management Teacher Development Unit, England) **The judgement process in management students' evaluation of their learning experiences.** *Human Relations*, 1975(Aug), Vol 28(6), 543-569.—Investigated the process of judgment underlying the formation of evaluative opinions by 6 management development program participants. The methodology of protocol analysis was employed. This involved an inductive analysis of the content of recordings made when a person is asked to "think aloud" while making a decision. Results show that many of the features of valid judgment (e.g., the use of objectifiable criteria and control-group logic) are present, to some extent, in the judgment process underlying evaluative opinions. This suggests that a certain amount of validity can be attached to opinion-based follow-up studies and that there is the possibility of designing such studies to encourage these processes.—*Journal abstract*.

3687. Corbin, Ruth M.; Olson, Chester L. & Abbondanza, Mona. (McGill U, Montreal, Canada) **Context effects in optional stopping decisions.** *Organizational Behavior & Human Performance*, 1975(Oct), Vol 14(2), 207-216.—Each of 16 undergraduates performed 120 trials on an optional stopping task, by sequentially seeking the maximum number in a stack of 5 cards, where only the current observation could be selected. With the prescription of the optimal strategy held constant, Ss' probability of selecting a given number was significantly influenced by several contextual variables including the magnitude of the given number, the magnitude of previous numbers in the stack, and the upward or downward trend exhibited by the previous numbers in the stack. This experimental task appears to be a convenient paradigm for investigating real-life aspects of decision making such as context effects and the option of not choosing from some given set of alternatives. 3688. Fehr, Jo Ann & Trotter, William D. (Marquette U) **Visual perception by speechreaders of selected syntactic structures.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 31-34.—That the perceptual unit for the comprehension of visually presented speech is

syntactic structure was concluded from giving instruments to assess the visual perception of basic sentence patterns and selected transformations to 118 undergraduates. The order of Ss' correct responses to syntactic structures is provided in an appendix.—*Journal abstract*.

3689. Fishburn, Peter C. (Pennsylvania State U) **A theory of subjective expected utility with vague preferences.** *Theory & Decision*, 1975(Aug), Vol 6(3), 287-310.—Demonstrates how notions of vagueness in preferences and judgments of personal probabilities can be accommodated, within an axiomatization of subjective expected utility, by the use of extraneous scaling probabilities and gambles on consequences. The representational form obtained says that the subjective expected utility of one act exceeds the subjective expected utility of a second act whenever the first is preferred to the second. The possibility is explored of obtaining this representational form under L. J. Savage's formulation, which does not use extraneous probabilities, and difficulties encountered in this approach are discussed. (36 ref)—*Journal abstract*.

3690. Funaro, Joseph F. **An empirical analysis of five descriptive models for cascaded inference.** *Organizational Behavior & Human Performance*, 1975(Oct), Vol 14(2), 186-206.—Examined the ability of 5 models to predict Ss' cascaded (i.e., multistage) odds in a probabilistic inference task based upon unreliable reports of binomial events. 3 different groups of 30 male naval aviation trainees each served under various conditions. Results suggest that Ss' cascaded odds can best be predicted from the odds estimated in a single stage inference task in which the likelihood ratio of a datum is equivalent to the formally appropriate likelihood ratio of a datum in the cascaded condition. Findings suggest that Ss may be using the same process to aggregate evidence in both single stage and multistage inference tasks. (17 ref)—*Journal abstract*.

3691. Gavurin, Edward I. & Murgatroyd, Dorothy. (Herbert H. Lehman Coll, City U New York) **Spatial aptitude and permutational ability.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 77-80.—Investigated the relationship between spatial aptitude and the ability to permute letters and numbers by presenting the Revised Minnesota Paper Form Board (MPFB), a letter rearrangement test (LRT), and a number rearrangement test (NRT) to separate samples of 94 and 53 undergraduates. For every comparison (MPFB vs LRT and MPFB vs NRT) and for males and females alike, significant positive correlations were obtained. In addition, a high positive correlation between the 2 permutational tasks (LRT vs NRT) was observed. Results confirm the hypothesis that spatial aptitude is associated with permutational skill and suggest that the former may also be associated with some of J. P. Guilford's (1967) divergent production factors.—*Journal abstract*.

3695. Kjellberg, Anders. (U Uppsala, Sweden) **Effects of sleep deprivation on performance of a problem-solving task.** *Psychological Reports*, 1975(Oct), Vol 37(2), 479-485.—Hypothesized that sleep deprivation could affect problem-solving performance by lowering Ss' standard of performance, provided that the task was such that S found failures acceptable. S would then spend less time on task and leave more items unsolved. In 2 experiments with a total of 32 paid undergraduates, a group informed that there were insoluble items was compared with a group who did not get this information. The results from Exp I indicate a lowered standard of performance in both groups after sleep deprivation. This was interpreted as a result of the extreme difficulty of the task which, in itself, might make failures acceptable. In Exp II the task was made easier, and only the group who knew about the insoluble items spent less time on the task after deprivation.—*Journal abstract*.

3700. Nelson, Douglas L.; Brooks, David H. & Wheeler, Joseph W. (U South Florida) **Sensory and meaning features in stimulus recognition and associative retrieval.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 711-719.—3 experiments, with a total of 122 undergraduates addressed the problem of isolating the effects of sensory similarity on subprocesses involved in coding paired associates. In Exp I the standard recognition-recall procedure was used, and stimulus similarity, concreteness, and frequency were varied. However, because of concern with the validity of this recognition procedure as a measure of functional stimulus contact, an alternative was developed. This alternative led to Exp II in which only stimulus similarity was manipulated. In Exp III similarity was varied, and the pairs were either associatively compatible, unrelated, or incompatible. Results

using the new procedure indicate that similarity consistently disrupted functional stimulus contact but not associative retrieval. By contrast, associative relatedness facilitated both subprocesses.—*Journal abstract.*

3701. **Palef, Sandra R. & Olson, David R.** (Ontario Inst for Studies in Education, Toronto, Canada) **Spatial and verbal rivalry in a Stroop-like task.** *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 201-209.—Examined the adequacy of P. Fraisse's (see PA, Vol 44:11728) empirical rule that reading is faster than naming and its generalization to the notion that reading interferes with naming as an explanation of Stroop-like interference effects. A spatial analog of J. R. Stroop's (1935) experiment was used, in which a total of 12 paid graduate and undergraduate students responded either to the meaning of the words "above" and "below" or to their above and below positions on a screen. Exp I showed that when spatial position was processed faster than word meaning, incongruent spatial positions interfered with decisions about word meaning, but incongruent word meanings did not interfere with decisions about spatial position. Exp II showed that when word meaning was processed faster than spatial position, the direction of interference was reversed, and when the processing times were approximately equal, interference was bidirectional. It is concluded that whether one obtains verbal interference effects on nonverbal decisions or nonverbal interference effects on verbal decisions depends on the relative speeds with which the 2 forms of information are processed. 3705. **Rose, Barbara J. & Birnbaum, Michael H.** (U California, Los Angeles) **Judgments of differences and ratios of numerals.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 194-200.—Conducted 2 experiments with a total of 68 undergraduates. Each S performed 2 tasks, dividing a line segment so that either (a) the ratio of subjective lengths corresponded to the ratio of the magnitudes of 2 numerals or (b) the

difference in length was proportional to the numerical difference. Had Ss actually performed 2 operations on the same scale, the responses would have been nonmonotonically related. Instead, data for the 2 tasks were nearly identical and ordinally compatible with either a ratio or a subtractive model. The ratio model implied scale values for numerals that were a positively accelerated function of numerical value, inconsistent with previous results. With a nonlinear response function for graphic length, the subtractive model fit well, yielding scale values that were a negatively accelerated function of numerical value and a linear function of previously obtained scales. Results, together with other recent findings, suggest that Ss may perform the same operation in spite of instructions to judge ratios or differences and that this operation can be best represented by a subtractive model. 3706. **Schneider, Klaus.** (Ruhr-U, Psychologisches Inst, W Germany) **[Subjective uncertainty and decision time.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 147-169.—Reports 2 studies which show that the amount of time needed to predict success or failure on a psychomotor task (decision time) can be considered an index of subjective uncertainty. The correlation between decision time and Ss' estimates of their confidence was high. Both confidence and decision time correlated significantly with the information theory measure "H," and the 3 correlates of subjective uncertainty (confidence, decision time, and H) predict choice among tasks varying in task difficulty. Ss prefer difficulty levels where their subjective uncertainty is a maximum. (2 p ref)—*English summary.*

3710. **Simonton, Dean K.** (U Arkansas) **Creativity, task complexity, and intuitive versus analytical problem solving.** *Psychological Reports*, 1975(Oct), Vol 37(2), 351-354.—Using 38 paid college students, the relative effectiveness of intuitive and analytical problem solving (thinking mode) was determined as a function of creativity (as measured by the Barron-Welsh Art Scale) and task complexity. A 3-way analysis of variance yielded a significant Thinking Mode \times Task Complexity \times Creativity interaction. More creative Ss found intuition more effective for a complex task, analysis on the simple task; this relation was reversed for the less creative Ss. (18 ref)—*Journal abstract.*

3711. **Solman, R. T.** (Australian National U, Canberra) **Influence of similarity between target and irrelevant items on visual information processing.** *Perception & Motor Skills*, 1975(Aug), Vol 41(1), 43-48.—6 undergrad-

uates searched circular stimulus displays of upper case letters of the alphabet for a prespecified single target letter. Displays were given a masked exposure of 100 msec, and contained 1, 5, 11, or 17 irrelevant items which were either similar or dissimilar in shape to the target. It was anticipated that these conditions would provide a test of U. Neisser's (1967) notion of attention. Results, which show that similarity, numbers, and their interaction were significant, could not be explained by wholly serial or parallel models of information processing as they failed to account for the interaction. To explain the interaction it was necessary to consider processing by preattention and focal attention.—*Journal abstract.*

3712. Sternberg, Daniel P. & Beier, Ernst G. (U Utah) **The effects of listening to compressed speech on some intellectual processes of children of lower socioeconomic status.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 238-246.—Explored whether listening to compressed speech (which gradually accelerated from 165 to 400 words/min on 15 successive days) would positively influence certain processes involved in listening. 42 lower socioeconomic status 3rd and 6th graders heard either compressed speech, normal speech, or music for 22 min/day. Pre- and posttest data on each S were obtained with the WISC, and with standardized tests of listening ability. Listening to compressed speech significantly improved the Vocabulary subscale score of the WISC. It is stated that this indicated an improvement in abstraction, a process noted to be similar to deriving the essence from information. (20 ref)—*Journal summary.*

3713. Thorndyke, Perry W. (Stanford U) **Conceptual complexity and imagery in comprehension and memory.** *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 359-369.—Conducted 2 experiments with a total of 32 undergraduates to test the hypothesis that verbs are represented in memory as combinations of primitive actions and relations which encode their underlying conceptual structure. In Exp I, comprehension latencies and cued recall probabilities were obtained for sentences of varying conceptual complexity. Increasing the complexity of conceptual structures resulted in longer comprehension latencies and lower recall levels when the verb was part of the target for recall. Results support the conceptual complexity hypothesis, but were confounded with imagery value of the verbs. In Exp II, imagery value and conceptual complexity were manipulated orthogonally. Results reject complexity in favor of imagery as the predictor of performance. Recall data from both experiments suggest that imagery had a discrete effect on memory for verbs only and did not serve to integrate individual sentences into holistic units. (20 ref)—*Journal abstract.*

3714. Watkins, Michael J. & Watkins, Olga C. (U Toronto, Canada) **A categorically postcategorical interpretation of the modality effect: A reply to Nilsson.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 733-735.—M. J. Watkins (see PA, Vol 49:6078) found the modality effect undiminished when 4-syllable rather than 1-syllable words were used, and concluded that the effect has a postcategorical origin. L. G. Nilsson (1975) replicated this result and also found that with entirely unfamiliar words the effect was greater with 1-syllable words than

with 4-syllable words. Nilsson considered his findings to be in support of a precategorical origin of the effect. This reply argues that, to the contrary, Nilsson's findings are not only consistent with a postcategorical interpretation, but also inconsistent with a precategorical interpretation.—*Journal abstract.*

3719. Bellezza, Francis S.; Geiselman, Ralph E. & Aronovsky, Linda A. (Ohio U) **Eye movements under different rehearsal strategies.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975 (Nov), Vol 104(1)(6), 673-679.—Eye movements were recorded while undergraduates studied lists of simultaneously presented words. The 24 Ss in the storage group studied for immediate recall, and the 24 Ss in the coding group studied primarily for a later, final recall. Those Ss in the coding group had longer eye fixations and fewer regressions than did Ss in the storage group. In addition, the Ss in the coding group recalled fewer words in immediate recall and more words in final recall. Results are interpreted as supporting the elaboration hypothesis of coding in rehearsal, which states that coding into long-term store consists of rehearsing both old and new information in short-term store. The results do not support the concentration hypothesis, which states that coding into long-term store consists of intensively rehearsing a smaller number of items than rehearsed under a storage strategy. Eye-movement data also indicate that Ss read about twice as many words as they overtly rehearse. (31 ref)—*Journal abstract.*

within generalized oddity performance, without reinforcement. *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 38-50.—In 2 oddity learning studies, 10-12 yr old short-term psychiatric patients were reinforced for oddity (or nonoddity) responding on line-tilt or dot numerosity problems. Interposed form and color problems were not reinforced. No instructions to make oddity choices were given. In Exp I it was found that reinforcement for oddity or nonoddity responding on tilt and numerosity problems produced the corresponding tendency toward oddity or nonoddity performance on these problems and also on the nonreinforced form and color problems. Results show a generalized oddity phenomenon similar to generalized imitation. In Exp II a 3rd type of nonreinforced problem was presented in this same format: compound stimuli permitting either a color or a form solution. It was found that immediate prior training with nonreinforced form problems, interpolated among the reinforced tilt and numerosity problems, led to form-oddity choices in the compound problems. Similarly, color pretraining produced color-oddity choices. Results show that selective discriminative stimulus control can be obtained in oddity learning, without reinforcement for choices on either of the 2 dimensions involved. (21 ref)—*Journal abstract*.

Variables of stimulus duration, interstimulus interval, dot intensity, and letter field were all shown to affect recognition performance of 15 naive college students.—*Journal abstract*.

3728. Cole, Ronald A. & Young, Michael. (Queens U, Kingston, Canada) Effect of subvocalization on memory for speech sounds. *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 772-779.—20 paid university staff and students, in 2 groups, were presented with sequences of 6 consonant-vowel syllables for ordered recall. Ss in both groups were trained to suppress subvocalization. Only Ss in the feedback group were asked to suppress subvocalization during the experiment, while Ss in the no-feedback group were allowed to subvocalize during the memory task. Analysis of the EMG records showed a large decrease in

subvocalization in the feedback condition, and results of the memory task revealed an increase in errors for this group. However, a comparison of errors within each group revealed an identical pattern of overall errors and intrusion errors on subvocalization and nonsubvocalization trials, and these results were identical in both groups. Results suggest that requiring Ss to simultaneously suppress subvocalization and remember syllables depresses performance slightly, but encoding of speech sounds in short-term memory occurs independently of subvocal activity during the memory task.—*Journal abstract*.

3729. Derogowski, Jan B. & Jahoda, Gustav. (U Aberdeen, Scotland) Efficacy of objects, pictures and words in a simple learning task. *International Journal of Psychology*, 1975, Vol 10(1), 19-25.—Required 50 adult females, mostly housewives, to memorize positions associated with 12 common objects, their pictures, and their names. Both written and spoken names were used. It was found that learning was fastest with the objects and slowest with verbal symbols and that pictures occupied an intermediate position. The data suggest that the errors observed were partly due to differential forgetting of various types of stimuli and partly perhaps to differential difficulty in making deductions from them. 3733. Federico, Pat-Anthony & Montague, William E. (US Navy Personnel Research & Development Ctr, San Diego, CA) Recognition memory as a function of encoding strategy & stimulus codability. *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 680-688.—Investigated how imaginal and verbal encoding strategies interact with various stimulus characteristics to either enhance or retard recognition, and tested the conceptual coding hypothesis of H. C. Ellis (1972). A between-groups multivariate factorial analysis of covariance experiment and a within-Ss multivariate factorial analysis of variance experiment were conducted with a total of 140 undergraduates. In Exp I it was found that low-codability shapes were better recognized under the verbal than the imaginal encoding set; high-codability shapes were recognized equally under the imaginal and verbal encoding sets; and high-codability shapes were not better recognized than low-codability shapes. However, in Exp II, where instructional set was a within-Ss factor, it was found that low-codability shapes were not better recognized under the verbal than the imaginal encoding set. 3734. Fillenbaum, Samuel. A note on memory for sense: Incidental recognition of warnings phrased as conditionals, disjunctives, and conjunctives. *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 293-294. —In a study with 62 undergraduates, warning sentences were phrased as either conditionals, conjunctive sentences, or disjunctive sentences with the 1st clause negated. Ss judged the warnings in terms of their equivalence of meaning. Performance on an incidental recognition test after a cover rating task showed that there was much confusion among the different phrasings of warnings even when these involved such radically different sentence operators as *if*, *and*, and *or*. Results suggest that memory is responsive to sense or meaning rather than the particular form in which it is realized. —*Journal abstract*.

3735. Franken, R. E. & Davis, J. (U Calgary, Canada) Predicting memory for pictures from rankings of interestingness, pleasingness, complexity, figure-ground and clarity. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 243-247. —10 university students ranked pictures used in the test phase of a picture-recognition task for interestingness, pleasingness, complexity, figure-ground, and clarity. The scale values obtained were then correlated with the errors made by other Ss in the test phase of the picture-recognition task. (2 groups of Ss—54 and 46 university students—were tested with a 100-msec exposure duration, while a 3rd group of 52 students was tested under 1,000 msec). Figure-ground and clarity were found, for the most part, to be reliable predictors of the errors made to both the "old" and "new" subsets of pictures in 2 experiments. Complexity, while not as consistent a predictor of either figure-ground or clarity, was a reasonably good predictor. Interestingness and pleasingness were not reliable predictors of errors. —*Journal abstract*.

3736. Fritzen, James. (Virginia Polytechnic Inst & State U) Intralist repetition effects in free recall. *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 756-763. Conducted 3 experiments with a total of 96 undergraduates to explore the conditions under which the presence of strong (repeated) items in a free recall list results in the reduced recall of weak (once-presented) items. In Exp I the effect of repeating items more than once was examined under 2 conditions, one in which Ss had to designate at recall which were the repeated words, and one in which there was no such requirement. In Exp II the once-presented words appeared either before or after the Ss had the opportunity to keep track of the repeated words. In Exp III the influence of paired once-presented words upon the recall of words presented alone was examined. Results are taken to indicate that the strength of the repeated items is not as important as are conditions which conceivably lead to changes in the rehearsal of once-presented items. —*Journal abstract*.

3737. Furedy, John J. & Ginsberg, Stanley. (U Toronto, Canada) Test of an orienting-reaction-recovery account of short-interval autonomic conditioning. *Biological Psychology*, 1975(Sep), Vol 3(2), 121-129. Examined electrodermal and plethysmographic components of the orienting reaction in 24 paid undergraduates in a conditioning-analog arrangement (tones and lights

patterned analogously to CS and UCS presentations) in order to test the orienting-reaction-recovery (ORR) account, according to which apparent short-interval autonomic conditioning (SIAC) can be completely accounted for by an ORR effect. The form of the test was to see whether ORR following change from a repeatedly presented forward (CS-UCS) analog would exceed that to change from a backward (UCS-CS) analog, as is the case in SIAC with CS-alone test trials following repeated CS-UCS vs UCS-CS pairings. Results do not support the ORR account, although they are consistent with the relevant experimental literature and provide internal evidence for the adequacy of the present test of this particular formulation of the ORR account of SIAC. (21 ref)—*Journal abstract*.

3738. Ghatais, Elizabeth S.; Levin, Joel R. & Subkoviak, Michael J. (Weber State Coll) Rehearsal strategy effects in children's discrimination learning: Confronting the crucible. *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 398-407. —Used a correlational methodology in an experimental context to determine the functional components of rehearsal strategies in 120 5th and 6th graders' discrimination learning. As anticipated on the basis of previous research, when a discrimination list was administered in the absence of explicit rehearsal instructions, Ss' ability to discriminate situational frequencies proved to be an important predictor of performance. However, when the same list was administered in the company of either an imagery or vocalization rehearsal strategy, frequency discrimination ability as a predictor was supplanted by Ss' ability to discriminate between previous usages and nonusages of the strategy. Results are discussed in terms of B. J. Underwood's (1975) individual differences crucible for theory construction. (23 ref)—*Journal abstract*.

(Kyushu U, Japan) Dual-encoding hypothesis in short-term memory: How does the nature of interpolated task affect information loss? *Japanese Psychological Research*, 1975(Jul), Vol 17(2), 91-97. —Conducted 2 experiments with a total of 95 undergraduates with normal or corrected-to-normal vision to demonstrate that the encoding in the short-term memory (STM) system is 2-dimensional in nature. Exp I was designed to retest K. Heyer and B. Barrett's (1971) hypothesis under the conditions of similar and dissimilar interpolated stimuli. Results of Exp I indicate that the identity information was encoded both acoustically and pictorially and that the position information was encoded pictorially. Exp II was designed to examine the effect of time lapse on the dual-encoding. Results suggest that 200 msec after the offset of the original stimulus, position information was encoded pictorially and identity information was encoded pictorially and acoustically in the STM system. A dual-encoding model is proposed based on the results of these experiments. —*Journal abstract*.

3745. Humphreys, Michael S. & Galbraith, Richard C. (Northwestern U) **Forward and backward associations in cued recall: Predictions from the encoding specificity principle.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 702-710.—Used unidirectional associates in a test of the encoding specificity principle with single items. 208 undergraduates served in 3 experiments. Strong preexperimental associates were effective retrieval cues even when encoding conditions were not conducive to the establishment of a target-cue association. While the length of the association from the target to the cue may have been involved in the cuing effect, the most important consideration was the presence of an association from the cue to the target. A comparison of the results from Exps I and II suggested that the presence of weak cues on the test reduced the effectiveness of strong cues. Exp III confirmed this finding. The generality of these findings to the encoding specificity principle is discussed.—*Journal abstract.*

3747. Jahnke, John C. (Miami U, OH) **Stimulus and response prefixes interfere differentially with short-term recall.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 727-732.—Contrasted the effects of 1 and 3 redundant elements on the recall of 50 undergraduates when the elements prefixed either the stimulus or the response. Recall was the same when a single redundant element was included in the presentation of the stimulus and when it was required in response. Relative to this level, recall improved slightly when 3 redundant elements were included in the stimulus and was degraded significantly when the 3 were required in response. Results are taken to indicate that both stimulus and response prefixes contribute to the load on memory, but that the mechanisms whereby this occurs are different. The relations of the stimulus and response prefix to the stimulus and response suffix are also considered.—*Journal abstract.*

3748. Johnson, G. J. (U British Columbia, Vancouver, Canada) **Transfer of serial learning as a function of interlist positional relations.** *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 183-194.—Transfer from one serial list to another was analyzed in terms of the degree of correspondence of interlist positional associations. This analysis implies that transfer of serial learning

is inversely related to the number of positions that items are displaced in the transfer list relative to their list locations. 3 experiments were conducted with a total of 168 undergraduates and 120 4th and 5th graders. These studies involved a serial-serial transfer design, while a serial-spatial discrimination transfer paradigm was used in the 3rd. Results of each study are consistent with the generalization that transfer of serial learning decreases as the degree of positional remoteness of the items, from one task to the next, is increased. These results and those of recent studies concerning H. Ebbinghaus's (1913) derived-list paradigm are readily interpretable in terms of a "positional" version of the concept of remote associations. 3751. Kolars, Paul A. (U Toronto, Canada) **Memorial consequences of automatized encoding.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 689-701.—Exp I tracked the acquisition of skilled reading as 12 undergraduates read as many as 160 pages of geometrically inverted text. The logarithm of reading time decreased linearly as a function of the logarithm of amount of practice, and performance on inverted text approached performance on normal text remarkably rapidly. Exp II assessed the consequence for memory of skill at reading. 8 undergraduates unpracticed at reading inverted text remembered for lengthy intervals the inverted sentences they read, when Ss acquired skill with the typography, their memory for inverted sentences was poorer. Results are interpreted in terms that emphasize an operational basis to memory—pattern-analyzing procedures rather than conscious contents. This view is contrasted with 3 other accounts of recognition. (26 ref)—*Journal abstract.*

3752. Koppell, Steven; McClure, Michael K.; Schulte, Ann. (U California, Santa Barbara) **Evidence for inter-item associations following the learning of a categorized list.** *Psychological Reports*, 1975(Oct), Vol 37(2), 475-478.—Following study of a categorized list of words, 20 undergraduates were tested for both free and cued recall. Order of words within categories was preserved and utilized by Ss in both tests. Results cannot be accounted for by N. J. Slamecka (see PA, Vol 42:9945 and 48:10374) or by D. Rundus's (see PA, Vol 50:2315) model of recall from categorized lists, or by a model in which order information is preserved by simply tagging items with their serial position. Data are consistent with the simple hypothesis that Ss learning categorized lists do acquire interitem associations.—*Journal abstract.*

3754. Leavitt, Jack & Ball, Terry. (U Windsor, Canada) Effect of instruction on recall of movements. *Conceptual & Motor Skills*, 1975(Aug), Vol 41(1), 124.—Employed a 4×4 factorial design with repeated measures across retention intervals and instructions to determine the effect of instruction on recall ability of movement information from short-term motor memory. Each of 16 male college students received all 16 possible treatment combinations. While both retention interval and instruction showed significant effects, there was no significant interaction. The reverse-order instruction was affected by the length of the retention interval while the no-prior-item, last-distance, and drop instructions were uninfluenced. No evidence supported the trace-decay hypothesis of forgetting. Ss seem easily able to remove information from memory or ignore information input so it is not represented in memory.—*Journal abstract*.
3755. Lemke, Elmer A.; Harris, Elizabeth & Manning, Keith. (Illinois State U) The use of generalized learning curves as a means for identifying strategies in a concept attainment task. *Journal of Educational Research*, 1975(Oct), Vol 69(2), 58-60.—85 undergraduates were administered the California Test of Mental Maturity, the 16 PF, and Raven Progressive Matrices along with 12 conjunctive-type concepts. Concept time-to-criterion scores were factor analyzed to obtain generalized curves. Factor scores on these curves were then computed and studied to identify concept attainment strategies. 3 such strategies—conservative focusing, hypothesis testing, and association learning—were so identified. The psychological measures could be seen to be differentially related to these concept attainment strategies.—*Journal abstract*.
3756. Loo, Robert. (U Calgary, Canada) Storage and retrieval of verbal information under various cueing conditions in a multitrial experiment. *Psychological Reports*, 1975(Oct), Vol 37(2), 467-470.—Examined the availability-accessibility hypothesis concerning recall for meaningful words. 10 undergraduates were assigned to each of 4 cuing conditions: cued learning, cued recall; cued learning, noncued recall; noncued learning, cued recall; and noncued learning, noncued recall. The stimuli were 40 meaningful words, each from a different category of either high or low taxonomic frequency. Trial recall demonstrated that cued recall was significantly more effective than noncued and that high taxonomic frequency words were more frequently recalled than low. Trend analysis of the 6 trials showed similar results.—*Journal abstract*.
3757. Lowenkron, Barry. (California State U, Los Angeles) Performance in intra- and extra-dimensional shifts as a function of solution mode in concept-identification problems. *Psychological Reports*, 1975(Oct), Vol 37(2), 447-454.—In an initial concept-identification problem with 1 relevant dimension, 128 undergraduates learned to respond to 12 stimuli, 4 of which occurred only on nonoutcome trials where feedback was never provided. After criterion or 48 overtraining trials, Ss were given a 2nd problem with novel stimuli in which either the initial dimension remained relevant (intradimensional shift) or a new dimension became relevant (extradimensional shift). Behavior on nonoutcome trials was taken as an indicator of a conceptual or nonconceptual mode of learning. Performance in the 2 shifts varied as a function of the solution mode Ss attained, while overtraining had no effect on the shift performance of either conceptual or nonconceptual Ss.—*Journal abstract*.

3759. Manning, Susan K.; Pasquali, Paula E. & Smith, Carole A. (Hunter Coll, City U New York) Effects of visual and tactual stimulus presentation on learning two-choice patterned and semirandom sequences. *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 736-744.—3 experiments compared the effects of visual and tactual stimulus presentation in 2-choice sequential learning situations requiring a predictive response. In Exps I and II a total of 104 undergraduates received a 5- or 6-unit repeating pattern; in Exp III 28 Ss received a semirandom sequence. Tactual as compared to visual stimulus presentation resulted in less trials to criterion in predicting a repeating pattern and in earlier frequency matching in predicting a semirandom sequence. Results suggest an unusual tactual adeptness in binary serial learning. Additionally, a new method of analyzing conditional responding in the probability learning paradigm is described and applied to the data in Exp III.—*Journal abstract*.
3760. McDonald, David G. & Johnson, Laverne C. (U Missouri, Medical School Columbus) Classical conditioning of autonomic responses in alert and drowsy subjects. *Biological Psychology*, 1975(Sep), Vol 3(2), 101-112.—69 17-24 yr old male US Naval Hospital Corps students in conditioning and pseudoconditioning groups were subdivided into alert and drowsy groups on the basis of EEG recordings during conditioning trials, giving a total of 4 groups: conditioning-alert, conditioning-drowsy, pseudoconditioning-alert, and pseudoconditioning-drowsy. Using the latency criterion to define responses, significant conditioning occurred only in the conditioning-alert group for skin resistance anticipatory and UCS-omission responses and finger plethysmograph anticipatory response. Both conditioning groups showed evidence of conditioned UCS-omission plethysmograph responses. Discussion centers primarily on (a) the implications of the results on the question of the feasibility of learning during sleep and (b) the importance of including EEG recordings in studies of classically conditioned autonomic responses. 3765. Ohta, Nobuo. (Tottori U, Japan) **[Organization and its transfer effects in serial verbal learning.]** (Japn) *Japanese Journal of Psychology*, 1975(Aug), Vol 46(3), 132-141.—Argues that when a serial list is learned by using the organization strategy, the organizational structure may be strengthened as the serial learning proceeds. The present study was designed to clarify the effect of the organization of the 1st learning on the 2nd learning (transfer task). 80 Ss were divided into 4 groups having different degrees of 1st-list learning. The degrees of learning were defined in terms of 4 criteria: 1/2 perfect trial, 1 perfect trial, 3 successive perfect trials, and 5 successive perfect trials. Results support the hypothesis that negative transfer appears in a U-shaped curve. The amount of negative transfer increased with the strengthening of the organization of the 1st learning and then decreased with more strengthening of it. (26 ref)—*English abstract*.

(Ruhr-U, Psychologisches Inst, Bochum, W Germany) **[Two mechanisms of selective identification.]** (Germ) *Archiv für Psychologie*, 1974, Vol 126(2-4), 231-252.—Suggests 2 possible types of explanation to account for the dependency of response performance on the degree of similarity between the stimulus alternatives. (a) According to conflict theory, the inferiority of performance which is caused by similarity is due to response conflict arising from the similarity of the response codes (i.e., the stimulus conditions that are necessary for response execution). (b) The abstraction theory holds that the response codes are reduced selectively so that the number of attributes for the control of responses is reduced. It is shown in a binary classification task, with

letters as stimuli, and introducing similarity by sameness of letters that selectivity of response control is warranted by abstraction for the positive response and by response conflict for the negative response.—*English summary*.

3777. Schwartz, Steven. (U Texas, Medical Branch, Galveston) **Encoding specificity and recognition memory for words.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 279-281.—Determined whether performance in recognition memory tasks depends on the recognition of a specific interpretation of a word (as originally encoded) or on its physical (orthographic-phonemic) representation, using a model of the recognition process based on signal-detection theory. 36

undergraduates studied lists of common and rare words in which each word was paired with a weakly associated cue. On a subsequent recognition task, old words were presented along with strongly associated cues. This change in accompanying cue impaired recognition for common but not for rare words. Differential recognition rates were not, however, associated with different levels of retention; rather, the effect was due to the cautious decision criterion employed for responses to common word meanings. Data suggest that recognition of a word depends upon its physical representation as well as its meaning and that the latter functions so as to affect response biases and not retention.—*Journal abstract.*

3778. Schwarz, Werner & Salzberg, Philip M. (U Colorado, Inst for the Study of Intellectual Behavior) **Free-recall performance as a function of input cue accessibility.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 764-771.—A list of 28 unrelated words was presented to 128 undergraduates with or without associated input cues on a single trial and was tested for free and cued recall. Accessibility of the cues was manipulated by having Ss learn none, half, or all of the cues prior to presentation of the word list. Relative to uncued-input control groups the non-cues condition produced poorer free recall, and the all-cues condition exhibited enhanced free recall. Furthermore, the half-cues conditions showed a diminished reduction in free recall compared to the non-cues group, free recall comprising primarily those words whose corresponding cues had been prelearned. Results demonstrate the Ss' covert use of input cues during free recall and indicate that the reduction in free recall with cued input is due to reduced accessibility of E-produced input cues compared to cues generated by the Ss.—*Journal abstract.*

3783. Stelmach, George E.; Kelso, J. A. & Wallace, Stephen A. (U Wisconsin, Motor Behavior Lab, Madison) **Preselection in short-term motor memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 745-755.—Recent studies by

B. Jones (see PA, Vol 52:175) have posited that accurate movements in short-term motor memory (STMM) are mediated by the S's ability to preset effector mechanisms and monitor their efferent output. 3 experiments were conducted with a total of 130 paid right-handed Ss to examine this hypothesis. Exp I involved comparisons between the reproduction of the end-location and the reproduction of the distance of a preselected movement. Results reveal that preselected location was superior to preselected distance, indicating that the efference attached to movement extent was not primary. Exp II examined whether location cues were primarily encoded independent of the movement presentation mode. Ss recalled target locations under preselected, constrained, and passive movement conditions. Recall in the preselected condition was superior to that in the constrained and passive conditions, suggesting that afferent are interpreted information per se was not totally responsible for recall accuracy. Exp III examined the processing requirements of preselected, constrained, and passive location information by filling the retention interval with interpolated processing activity. While preselected location was clearly superior, the 3 conditions were not differentially affected by processing activity. Findings are interpreted as contrary to Jones and point to the importance of preselection in short-term memory. (19 ref)—*Journal abstract.*

3784. Strand, Bonnie Z. (Kean Coll) **Effects of instructions for category organization on long-term retention.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Nov), Vol 104(1)(6), 780-786.—The effect of different organizational instructions in free-recall learning on 5-7 day retention was studied in 2 experiments with a total of 121 undergraduates. In each study all Ss learned an identical list of words, with instructions and input blocking suggesting use of either subjective organization or else categorization, according to sensory-dominance categories; categorization was either linear or hierarchical. In both experiments, instructions to use categories used by the Ss are considered as the primary explanation of the findings.—*Journal abstract.*

3789. Wilson, William P.; Witryol, Sam L. & Hust, B. Edward. (U Connecticut) Differential incentive motivation in recency and primacy during children's free recall. *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 131-145.—Presented 36 5th-grade boys and girls with 5 18-word lists within which individual items were associated with \$.10 or \$.01 rewards. Three independent groups were exposed to items associated with high, low, or randomly distributed values in the last 5 input positions. Results show (a) higher recall in recency for \$.10 over \$.01 words concentrated in the final 5 positions, (b) higher recall in primacy for \$.10 over \$.01 words for Ss exposed to the higher values in early list portions, (c) superiority for high incentive words on all 3 retention measures, and (d) both storage and retrieval processes operating to determine incentive effects in delayed recall. (18 ref)—*Journal abstract*.

3790. Wiseman, Sander & Tulving, Endel. (U Toronto) A test of confusion theory of encoding specificity. *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 370-381.—24 undergraduates studied and were tested for recognition and recall of target words on 4 successive lists of cue-target word pairs. List-cued recall was higher than recognition of target words in the absence of list cues in all lists, suggesting that recognition failure of recallable words is independent of Ss' familiarity with the task requirements. Results do not support explanations that attribute phenomena of encoding specificity to various sources of confusion in the method and procedure used in previous experiments. 3792. Yoshida, Hajime. (Kyushu Fukuoka, City, Japan) [The effect of awareness of learning steps on performance gains in concept conditioning: Analysis of response processes.] (Japn) *Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 100-108.—In a study with 39 6th graders, the relationship between awareness of learning steps and performance gains was examined by analyzing response processes of concept conditioning. Through an interview, Ss were classified into those who were unaware of the contingency (no awareness group), those who were aware of the contingency only (association group), and those who had acquired the concept (concept group). Results show that (a) successful conditioning occurred only in the concept group, (b) the concept group showed performance increment only during the postawareness phase, (c) the association group did not show performance increment during the pre- or postawareness phase, and (d) responses not reinforced on the preawareness trials occurred significantly more often on subsequent trials. Responses which received 1, 2, or 3 reinforcements during the preawareness phase did not increase on subsequent trials. Results are discussed in terms of cognitive control of concept conditioning.—*English abstract*.

3793. Yoshida, Hajime. (Miyazaki U, Japan) The effect of awareness on performance gains in concept conditioning. *Japanese Psychological Research*, 1975(Jul), Vol 17(2), 79-86.—Investigated the temporal relationship between performance gains and awareness in concept conditioning. 41 high school students were each required to select 1 of the 4 words of 4 different concepts. Awareness of the concept and the contingency between responses and reinforcement was evaluated by means of a postconditioning interview. Successful conditioning was found in Ss who had acquired the concept. The performance increased after Ss acquired the concept, though performance in these Ss did not increase prior to reports of the concepts. Performance gains were not found in Ss who were merely aware of the contingency, nor in Ss who were not aware of the contingency. Results suggest that performance gains in concept conditioning are not mediated by awareness of the contingency, but mediated by awareness of the concept. (15 ref)—*Journal abstract*.

3794. Zeller, Michael D. & Fite, Gay M. (Emory U) Reinforcement of responding and not responding: Alternative responses. *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 276-278.—After 8 adults earned points according to a VI schedule for pressing a key, they could earn points either by pressing or not pressing that same key for 10 sec. Decrements in response rate depended on the availability of explicit alternative responses. If 1 or 2 other keys were available, responding decreased to the target key, even though responses to the other keys had neither a scheduled nor a historical relation to point increments. Thus, the conjoint scheduling of point presentation for responding and not responding attenuated response rate only when explicit other responses were available.—*Journal abstract*.

Motivation & Emotion

3795. Berger, Chris J.; Cummings, L. L. & Heneman, Herbert G. (U Wisconsin, Industrial Relations Research Inst, Madison) Expectancy theory and operant conditioning predictions of performance under variable ratio and continuous schedules of reinforcement. *Organizational Behavior & Human Performance*, 1975(Oct), Vol 14(2), 227-243.—Extended a study by G. Yukl et al (see PA, Vol 47:11899) by testing directionally different predictions derived from operant conditioning and expectancy theory in a 3×5 split-plot repeated measures design. 15 18-32 yr old females were randomly assigned to 3 schedule and magnitude of reinforcement conditions (continuous reinforcement—\$.025, VR-2—\$.25, or VR-2—\$.50). When additional pay was contingent upon performance, performance increased significantly. However, response levels and response rates were not significantly different between the 3 experimental groups. Composite scores derived from an additive expectancy model accounted for significant additional increments in explained variance after controlling for baseline performance and schedule of reinforcement. Results stress the need to include both environmental and perceptual variables in accounts of work behavior. (18 ref)—*Journal abstract*.

3796. Birkhill, William R. & Schale, K. Warner. (U Michigan, Dearborn) The effect of differential rein-

forcement of cautiousness in intellectual performance among the elderly. *Journal of Gerontology*, 1973(Sep), Vol 30(5), 578-583. Investigated the effects of differential reinforcement of cautiousness upon intellectual performance in the elderly employing 56 females and 32 males with a mean age of 73 yrs. Cautiousness was manipulated by systematically varying pretest instruction conditions involving the reinforcement of 2 levels of risk and of response omission when taking the Primary Mental Abilities Test. Results suggest that performance in intelligence tests is much influenced by situational variables involving motivational components. Ss exposed to low-risk conditions performed significantly better on cognitive tasks than those exposed to high-risk conditions only when they were able to exercise the option of responding or not responding to individual task items. Implications for a reconstruction of conventional intelligence measures are discussed. *Journal abstract*

(U Southern Mississippi) Effects of four psychological primary colors on anxiety state. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 207-210.—Assessed effects of the 4 psychological primary colors by randomly assigning 40 undergraduates to 4 treatment groups, with each group receiving either red, yellow, green, or blue illumination. Anxiety state was assessed at 5-min intervals using the State-Trait Anxiety Inventory. The red and yellow groups had significantly higher A-state scores than the blue and green groups, and these values did not change significantly during the 15-min testing session.—*Journal abstract*

3806. Kallin, V. K. (Simferopol State U, USSR) [The effects of emotional tension on the efficiency of volitional efforts.] (Russ) *Voprosy Psikhologii*, 1975(May-Jun), No 3, 111-115.—Studied muscular effort of 31 sportsmen who were instructed to pull on a finger ergograph to the limits of endurance. In an experiment 2 wks later, ergograph performance below previously established levels was to be punished by electric shock, although none was actually administered. Under these conditions 8 Ss worked harder, 8 worked less hard, and effort by the 15 others fluctuated in various ways. Observations of the 1st group of sportsmen in actual competition showed that most of them performed better in competition than in training, while the 2nd group performed better in training than in competition ($p < .01$). Measures of the strength of the nervous system showed that most sportsmen who performed well under stress had a strong nervous system, while those who did not perform as well usually showed a weaker nervous system. The shock system (Exp II) markedly inhibited the muscular effort put forth by individuals with weak nervous systems. (28 ref)—L. Zusne.

3811. Schmitt, Neal. (Michigan State U) A causal-correlational analysis of expectancy theory hypothesis.

Psychological Reports, 1975(Oct), Vol 37(2), 427-431.

—Expectancy theory proposes that job effort is a function of the values individuals place on work outcomes and the expectations they have concerning the likelihood of attaining these outcomes. Another hypothesis states that effort or work motivation produces changes in performance level. Utilizing cross-lagged correlations to evaluate the expectancy-effort and effort-performance relationships, it was found that 53 undergraduates' grades in an introductory psychology course may have affected effort. Some support was also indicated for the contention that performance causes attitudes toward both performance (good grades in psychology) and work (studying psychology). (15 ref) —*Journal abstract*.

3817. Worchel, Stephen; Lee, Jerry & Adewole, Akanbi. (U Virginia) **Effects of supply and demand on ratings of object value.** *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 906-914. In 2 experiments, a total of 200 female undergraduates rated the value and attractiveness of cookies that were either in abundant supply or scarce supply. In the scarce condition, the cookies were either constantly scarce or they began in abundant supply and then decreased. Ss were told that this decrease in supply was either due to an accident or to a high demand for the cookies. In the abundant condition, the cookies were either constantly abundant or first scarce and then abundant. The increase in supply was either due to an accident or to a lack of demand for the cookies. These conditions were crossed with a manipulation in which Ss thought either a high or low number of additional Ss were still to participate in the study. Results indicate that (a) cookies in scarce supply were rated as more desirable than cookies in abundant supply; (b) cookies were rated as more valuable when their supply changed from abundant to scarce than when they were constantly scarce; and (c) cookies scarce because of high demand were rated higher

than cookies that were scarce because of an accident. With regard to abundance, cookies that were constantly abundant were rated higher than cookies that began scarce but later became abundant. Results extend commodity theory. Reactance was hypothesized as an intervening process responsible for some of the results. The 2nd study was performed to rule out the possibility that demand characteristics were responsible for the obtained results.—*Journal abstract*.

3822. Iwata, Osamu. (Shikoku Women's U, Tokushima.) **An analytical study on the effect of acoustic environment upon a continuous addition task.** *Japanese Psychological Research*, 1975(Jul), Vol 17(2), 61-71.—Analyzed individual differences in the effect of noise on a continuous addition task (Uchida-Kraepelin Psychodiagnostic Test). 94 university and junior college female students worked the task in both quiet and noisy conditions. Radio news and a cross-talk comedy were presented during the noisy condition. High and low scorers were selected in terms of performance level, fluctuation of performance, strain of willpower, errors, and effect of rest which were obtained from the quiet and pre-rest condition. Comparisons of these 2 groups showed that the effect of noise upon the task was different in the indices of performance and that those whose performance characteristics were different showed different performance patterns. A rating of seriousness of noise disturbance was related to task performance.—*Journal abstract*.

3823. Iwata, Osamu. **[Concentration on performance as a determinant in the effect of acoustic environment upon performance.]** (Japn) *Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 91-99.—Conducted 2 experiments to examine the degree of concentration on performance as a determinant in the effect of acoustic stimuli upon performance. In Exp I 2 groups of female college students, whose concentration on performance was high or low, took part in a choice reaction-time task in which 2 visual signals were presented in 2 conditions. One was a quiet condition and the other was an instrumental music condition. In Exp II a group of medium-concentration Ss was added to the 2 groups and radio news and cross-talk were presented to S instead of music. Results show that concentration on performance was a very important determinant in the effect of

acoustic stimuli upon performance. (28 ref)—*English abstract.*

EXPERIMENTAL PSYCHOLOGY (ANIMAL)

3828. Archer, John. (U Sussex, School of Biological Sciences, Brighton, England) **The Maudsley reactive and nonreactive strains of rats: The need for an objective evaluation of differences.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 411-413.—Takes issue with the conclusions made following a recent study by P. L. Broadhurst (see PA, Vol 55:Issue 3) and a previous one (H. J. Eysenck and Broadhurst, 1964), which indicated that Maudsley Reactive and Maudsley Nonreactive strains of rats possess widely different biochemical and behavioral profiles. Broadhurst evaluated these differences with reference to the concept of emotionality and concluded that the strains are characterized by relatively stable differences in a generalized trait of this nature. The present author contends that any one of a number of specific factors (e.g., body weight, sex, and endocrine differences) might be important in determining the characteristic strain differences or that there might be underlying differences of a more widespread nature in their behavioral and biochemical profiles. He posits that it is important to adopt a more open approach when making such inquiries into the 2 strains.—P. O'Brien.

3829. Bauer, Joseph & Held, Richard. (Massachusetts Inst of Technology) **Comparison of visually guided reaching in normal and deprived infant monkeys.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 298-308.—A stump-tailed macaque, deprived of sight of its hands and body since shortly after birth, appears to be deficient in the accuracy and precision of its visually guided reaching. These deprived monkeys quickly develop adequate reaches if they are allowed to view their hands. To assess the deficit, a method of open-loop testing (no sight of the reaching limb) was developed for use on both an experimental group deprived of sight of limbs and a control group raised under identical restraints but allowed sight of limbs. Ss were 8 infant stump-tail monkeys. Results show that the deprived Ss learned to reach a given visible target, but the learned reach was not as precise in the training condition or as precise to new target directions as it was for controls. Furthermore, there was little intermanual transfer of reaching skill for

the experimentals but nearly 100% transfer for the controls. Finally, experimentals showed a loss of precision in retention testing following a lack of practice, but controls did not. It is concluded that the differences in visually guided reaching behavior of the 2 groups is evidence that the normal accuracy results from unconstrained vision of the hands which produces a mapping of the coordinates of motor response onto the space of vision.—*Journal abstract.*

3830. Boothe, R.; Teller, D. Y. & Sackett, G. P. (U Washington, Medical School, Seattle) **Trichromacy in normally reared and light deprived infant monkeys (*Macaca nemestrina*).** *Vision Research*, 1975(Nov), Vol 15(11), 1187-1191.—3 infant pigtailed monkeys were separated from their mothers a few days after birth and individually housed in a specially designed testing cage. Each was taught to discriminate white light from each of several narrow-band wavelengths of light. During the 1st 2 mo after birth, each of the Ss learned to discriminate all wavelengths tested from white light, regardless of relative luminance. An infant which had been raised in continuous darkness from 2 wks until 3 mo after birth was similarly tested. The dark-reared S also successfully learned to discriminate all wavelengths tested from white light. It is concluded that infant pigtail monkeys have trichromatic color vision by the age of 2 mo and that their trichromacy remains present following a period of dark rearing during the 1st 3 mo after birth. (25 ref)—*Journal abstract.*

3831. Borchelt, Peter L. & Overmann, Stephen R. (Fordham U) **Development of dustbathing in bobwhite quail: II. Effects of early pecking experiences.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 417-423.—Facilitated the development of dustbathing among groups of 111 Bobwhite chicks allowed, in Study 1, to peck into dust as compared to chicks allowed to peck at dust or those inexperienced with dust. Study 2 found a consistent, but nonsignificant, facilitation among 52 Ss pecking into dust on Days 1-3 as compared to Days 4-6. In Study 3, 81 Ss pecked into dust on Days 2, 4, or 6. Dustbathing development was facilitated among Ss pecking on Day 2, and inhibited among Ss pecking on Day 4, as compared to those pecking on Day 6. The only difference, however, between each of these groups and Ss with no pecking experience in dust (Study 1) was an inhibition of dustbathing among Ss pecking on Day 4. 3838. Hayashibe, Keikichi; Tsuji, Keiichiro & Hara, Masatoshi. (Nagoya U, Japan) **Chick's avoidance of visual pitfalls under monocularized condition.** *Japanese Psychological Research*, 1975(Jul), Vol 17(2), 87-90.

Tested 20 monocularized male chicks on visual pitfalls. They avoided visual pitfalls as successfully as binocular ones except that the former exhibited more remarkable peeping into visual pitfalls accompanied by large head movements than the latter. These findings suggest that the detection of motion parallax was made easier by means of using an unclosed eye exclusively for the compensation of monocularization. Additionally, some findings of monocular depth discrimination in the human is discussed in connection with those of animals. It is concluded that monocular vision is as efficient as binocular for depth discrimination.—*Journal abstract.*

3839. Haythorn, Mark M. & Henry, Kenneth R. (U California, Davis) **Albinism and auditory function in the laboratory mouse: II. Effects of acoustic priming and cross-fostering.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 321-329. Examined albino (c/c) and nonalbino (+/+ and +/+) congenic C57BL/6J mice for the effects of acoustic prestimulation (priming) on audiogenic seizures. A total of 130 Ss were used in 2 experiments. While no genotypic-specific effects were noticed 1 day after priming, major effects were observed in separate groups

of Ss tested 5 days after priming. The c/c Ss were most susceptible to audiogenic seizures, and no differences were observed between +/c and +/+ Ss. While cross-fostering did not change this relationship, it provided protection for Ss of all 3 genotypes. The interpretation that melanin offers protection from acoustic trauma is considered inconclusive because of the interaction of innate- and priming-induced audiogenic seizures in +/c and c/c Ss. 3841. McFarland, W. N. & Munz, F. W. (Cornell U, Section of Ecology & Systematics) **Part III: The evolution of photopic visual pigments in fishes.** *Vision Research*, 1975(Oct), Vol 15(10), 1071-1080.—The feeding strategies of diurnal tropical marine fishes correlate with the visual pigments extracted from their retinæ and with the photic environments in which they hunt prey. 2 basic feeding modes prevail. Fishes that silhouette prey from below possess a single visual pigment matched to the spectral distribution of downwelling light. This maximizes the contrast between the brighter background and darker target. To predators that view prey in the horizontal field, their targets may appear either darker or brighter than the background. The photocontrast of a nonreflective target is maximized by a class of cones with a matching visual pigment. But the contrast of reflective (bright) targets is enhanced by visual pigments offset from the spectral distribution of the monochromatic blue background. Thus, the evolutionary selection of multiple photopic systems, and of color vision itself, is probably related to the maximization of visual contrast against monochromatic backgrounds. Reports that Mongolian gerbils housed with laboratory rats under conditions designed to maximize the transmission of otitis media were found at necropsy to be free of this middle ear disease, while the rats were found to have an 83% incidence.

3844. Mohler, Charles W. & Cechner, Ronald. (NIMH, Bethesda, MD) **Saccadic suppression in the monkey.** *Vision Research*, 1975(Oct), Vol 15(10), 1157-1160.—Trained 3 rhesus monkeys to make a behavioral response to a short duration flash of light presented during the eye movements of optokinetic nystagmus. This behavioral testing demonstrated a visual threshold elevation of 0.5-0.8 log units from 25 msec before until 50 msec after onset of the fast phase of optokinetic nystagmus, similar to the phenomenon of saccadic suppression in the human. Following behavioral testing, chronically implanted electrodes in the striate visual cortex of these monkeys measured the visual evoked response during suppression of the behavioral response. The cortical response to light was decreased

during the fast phase of optokinetic nystagmus, but this reduction in visual cortical response was not specifically related to the decrease in the S's perception of the light.—*Journal abstract.*

3845. **Moody, Margaret I.** (State U New York, Stony Brook) **Perception of total reflection by *Barbus*.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 239-243.—Experimental results suggest that the fish could not only perceive images readily within the totally reflected region of its visual field but could discriminate between real images and reflected images shown at similar visual angles.

3846. **Morley, Barbara J. & Abelson, Robert M.** (William Paterson Coll) **Further comments on deleterious behavioral and physiological effects of sound.** *Psychological Reports*, 1975(Oct), Vol 37(2), 544-546.—Questions the use of ultrasonic sound as a means of controlling rat populations. The following points are discussed: (a) the processes of refraction and decreased audiogenic seizure susceptibility with repeated exposure to sound, (b) the genetic variability of the rat with respect to auditory behaviors, (c) the behavioral and physiological responses of organisms other than the rat, and (d) the behavioral responses of rats to ultrasonic sound at distances from the sound source. It is concluded that such a device may be effective under certain circumstances, but more data are needed with respect to the behavioral and physiological effects of ultrasonic sound before it is used for rat control.—*Journal abstract.*

3848. **Padmos, Pieter & Norren, Dirk V.** (TNO, Inst for Perception, Soesterberg, Netherlands) **Increment spectral sensitivity and colour discrimination in the primate, studied by means of graded potentials from the striate cortex.** *Vision Research*, 1975(Oct), Vol 15(10), 1103-1113.—Implanted electrodes on the subdural surface of the foveal striate cortex of 4 male macaque monkeys. The sensitivity of the responses to monochromatic 300-msec flashes of 5° subtense on white and colored backgrounds was measured. The resulting increment spectral sensitivities gave evidence for color opponent interactions. A quantitative relation could be established between the obtained electrophysiological data and human psychophysical color discrimination functions. The data show that the cortical response was much more sensitive to a color change than to a luminance change. The shape of the cortical response was constant for different stimulus wavelengths, indicating that the observed color-opponent interaction was already established at earlier levels of visual processing. 3849. **Royce, J. R., Holmes, T. M. & Poley, Wayne.** **Behavior genetic analysis of mouse emotionality: III. The diallel analysis.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 351-372.—Obtained a total of 775 pure-strain and F₁ mice from a 6 × 6 diallel mating plan. Previous factor analysis of 42 measures of emotionality identified 14 behavioral factors, 10 of which were interpretable. B. Hayman's (1954) analysis of variance and analysis of

diallel crosses were applied to each of the factors. Findings indicate that the mode of inheritance for emotionality factors is polygenic and in the direction of complete dominance. However, the mode of inheritance of highly complex behavior such as emotionality depends on the factor in question. For example, the breakdown of dominance effects by factor was as follows: partial dominance—motor discharge, food motivation, tunneling-2, and activity level (males); complete dominance—audiogenic reactivity, underwater swimming (males), and activity level (females); overdominance—acrophobia, territorial marking (males). Additional findings include directional dominance for underwater swimming and audiogenic reactivity. (57 ref)—*Journal abstract.*

rats, investigated the effectiveness of reminder treatments in potentiating memory in Ss given either strong fear conditioning and ECS or weak fear conditioning. In Exp I, reminder increased memory in both groups. Exp II substantiated this finding under somewhat different conditions and also showed that, in I reminder condition, increased memory was obtained in Ss fear conditioned and given ECS, while no effect was noted in Ss given weak fear conditioning. The finding of differential modification of memory with reminder in these 2 groups suggests that a previous interpretation, based on the usual finding of parallel modification with reminder in these groups, may be incorrect. Moreover, these data suggest that the major effect of ECS is on memory retrieval processes. (17 ref)—*Journal abstract*.

3861. Eisenberger, Robert; Frank, Michael & Park, Denise C. (State U New York, Albany) **Incentive contrast of choice behavior.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 346-354.—While incentive contrast has been reliably demonstrated in single-response situations, tests for contrast-of-choice behavior have invariably failed to obtain the effect. 3 experiments were conducted that eliminated features of prior methodology which, as N. E. Spear and J. H. Spitzner (see PA, Vol 40:10800; Vol 43:17085) suggested, can mask the effect. Negative and positive contrast-of-choice behaviors were obtained. In Exp I 90 male albino rats were given 48 food-rewarded runs in a straight alley followed by 16 choices between the original alley and a novel alley containing equivalent small rewards. Ss experiencing a downshift of reward following the 40th run chose the original alley less frequently than did Ss experiencing the smaller reward all along. In Exps II and III, a total of 56 rats were given 52 food-rewarded runs to 1 goal alley of a T maze followed by 20 choices between the original alley and a novel alley containing equivalent large rewards. Ss experiencing an upshift of reward following the 40th run chose the original alley more frequently than did Ss experiencing the larger reward all along. Findings attest to the generality of the incentive-contrast phenomenon. (15 ref)—*Journal abstract*.

3869. Haroutunian, Vahram & Riccio, David C. (Kent State U) **Acquisition of rotation-induced taste aversion as a function of drinking-treatment delay.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 273-277.—Conducted 3 experiments with a total of 62 male Holtzman rats. 4 groups received rotation treatment 0.5, 15, 30, or 120 min after consumption of a saccharin solution. Taste aversion to saccharin developed after a single drinking-rotation session in the 0.5-min delay group and after 3 trials in the 15- and 30-min delay groups. No aversion to saccharin was found in the 120-min delay group. Rotation failed to produce learning to nongustatory cues in either conditioned emotional response or passive avoidance paradigms. It is concluded that rotation shared common effects with poisoning and irradiation.—*Journal abstract*.

3870. Hill, Charles W. & Riopelle, Arthur J. (U New Orleans) **Protein deprivation in primates: VI. Food preferences of adult rhesus monkeys maintained on low-protein diets.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 199-204.—Compared 24 adult female rhesus monkeys (*Macaca mulatta*) in 3 groups maintained on low-protein diets (0.5 gm, 1 gm, and 2 gm protein/kg body weight) with a control group (4 gm protein/kg body weight) on a food preference task. Food responsiveness was assessed by presenting 8 small pieces of a certain food, equally spaced about the perimeter of a turntable attached to the home cage and recording number of pieces taken, number of pieces eaten, and elapsed time for taking all 8 pieces. 24 different foods

were used in sequence, 3 each from the following 7 categories: cheese, meat, vegetable, nut, cereal, fruit, and candy. Scores on all 3 measures were highly correlated, and the order of preference was generally the same for all groups. The 2 lowest-protein groups accepted more foods at the lower end of the palatability spectrum than did either the 4-gm or the 2-gm group. There was a tendency for the foods least preferred by the protein-deprived Ss to be themselves high in protein. Thus, although protein deprivation appeared to increase the catholicity of food preference, there was no corresponding increase in the relationship between palatability and protein content.—*Journal abstract.*

3871. Holland, Peter C. & Rescorla, Robert A. (Yale U) **The effect of two ways of devaluing the unconditioned stimulus after first- and second-order appetitive conditioning.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 355-363.—Conducted 2 experiments with 32 male Sprague-Dawley rats in each. Ss received 1st- and 2nd-order conditioning based upon a food UCS. They then received 1 of 2 manipulations designed to reduce the value of that food, satiation, or pairing of food with high-speed rotation. The effects of these manipulations were assessed during extinction tests of the CSs. Compared with controls, both manipulations reduced the activity produced by the 1st-order CS but did not affect that produced by a 2nd-order CS. Results are interpreted as consistent with those from aversive UCSs in implying the involvement of a UCS representation in 1st- but not in 2nd-order conditioning. They also suggest that a major effect of satiation is to reduce the value of the UCS. (15 ref)—*Journal abstract.*

3872. Hull, John H.; Myers, James S. & Smith, Gregory J. (Kent State U) **Consistent leverpress avoidance responding by rats.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 297-299.—Presented 24 male Long-Evans rats with a retractable lever, followed 10 sec later by shock of 0.5, 1.0, or 2.0 mA, respectively. Leverpresses occurring during the 10-sec interval resulted in immediate retraction of the lever and avoidance of shock. If the lever was not pressed within 10 sec, shock was administered until the lever was pressed or for a maximum of 20 sec, at which time the lever retracted and shock terminated. Within 200 trials, most Ss avoided 80-90% of shocks, regardless of shock intensity.—*Journal abstract.*

3873. Ison, James R.; Zuckerman, Marc & Russo, John M. (U Rochester) **Combination rules for inhibitory stimuli.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 318-325.—Startle reactions are inhibited if their elicitation is preceded by weak neutral stimuli at lead times of fractions of a second or by intense startle-eliciting stimuli at lead times of up to several seconds. In 3 experiments with a total of 36 male albino Holtzman rats (a) 2 weak stimuli, (b) 1 weak stimulus and 1 intense stimulus, or (c) 2 strong stimuli were given in combination. In all 3 conditions the combination provided more response inhibition than did either stimulus alone. Conditions 1 and 2 gave combination effects in which the inhibited proportion of the response was described by the rule for compounding the probabilities of independent events, indicating that the

stimuli had noncompetitive independent access to the inhibitory machinery. The rule overestimated the effect of the compound in Condition c, suggesting the presence of some other summative process, perhaps involving the prolongation of the refractory period.—*Journal abstract.*

3874. Kalat, James W. (Duke U) **Taste-aversion learning in infant guinea pigs.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 383-387.—88 American short-hair guinea pigs were hand-fed a 10% sucrose solution and poisoned after delays of 0 min, 30 min, or 24+ hrs. Ss in the 1st 2 groups showed significant sucrose aversions when tested more than a month later. No significant difference existed between the 0- and 30-min groups; no deficiency in this type of learning was evident even in neonates. All 3 groups showed a lower sucrose preference if first exposed to sucrose at ages 0-6 days than at 7-11 days. Exposure to sucrose at the earlier ages appears less effective in reducing later neophobia to sucrose; although the youngest Ss had no evident deficiency in learning aversions, they may have been deficient in learning "safety." 3879. Mackintosh, N. J. (U Sussex, Brighton, England) **Blocking of conditioned suppression: Role of the first compound trial.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 335-345.—4 experiments, with a total of 60 COBS male rats and 128 male and female hooded rats, all employing the conditioned suppression of licking in thirsty rats, examined the extent to which reinforcement of 1 component, A, of a compound CS, AB, would "block" conditioning to the other element, B, on the 1st compound trial. Suppression to B was unaffected by prior reinforcement of A; that is, no evidence of blocking

was obtained. If additional reinforced trials were given to the AB compound, further conditioning to B was blocked by prior reinforcement of A. Thus blocking appeared to take at least 1 trial to develop. Results suggest that blocking is not due to any competition between stimuli for association with reinforcement but is a consequence of the rats' ignoring the added element once they have learned that it is redundant.—*Journal abstract.*

3880. McGrew, W. C.; Tutin, C. E. & Midgett, P. S. (U Stirling, Scotland) **Tool use in a group of captive chimpanzees: I. Escape.** *Zeitschrift für Tierpsychologie*, 1975(Mar), Vol 37(2), 145-162.—Observed a group of 4 female and 3 male adolescent wild-born chimpanzees for 7 mo in a 30 × 60 m outdoor enclosure. Techniques employed by the animals to escape from the 5½ m high walls included ladders improvised from poles used in play activities, and (after the poles were no longer available) piton-like objects inserted into the walls as supports. Other attempts involved sticks used as levers, as substitute keys, and as a tool to retrieve another tool. Some of the uses of escape tools may be attributed to imitation of similar human activities, but others seem to be cases of genuine invention and social learning within the group. 3882. Mishkin, Mortimer & Delacour, Jean. (NIMH, Section on Neuropsychology, Bethesda, MD) **An analysis of short-term visual memory in the monkey.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 326-334.—Conducted 2 experiments with a total of 20 rhesus monkeys. Visual memory was examined under 4 different conditions, each with a separate group. In all conditions, the delay between sample and choice was 10 sec, and the delay between trials was 30 sec. The procedural differences were matching or nonmatching with the same 2 objects presented repeatedly and matching or nonmatching with trial-unique objects. With the customary repetitive stimuli, whether in matching or nonmatching, most Ss either required prolonged training to solve the problem (over 40 sessions) or failed to solve it, corroborating the learning difficulties reported earlier by others. With trial-unique stimuli, by contrast, most Ss learned quickly (matching, under 20 sessions; nonmatching, under 5 sessions). Furthermore, in nonmatching with trial-unique stimuli, scores averaged 80% correct in the 1st session, even though Ss were experimentally naive. Results indicate that recognition of a stimulus as familiar or novel is highly developed in monkeys and that their difficulty with the customary nonspatial visual memory tasks stems from a retardation in noticing and using the mnemonic cue of recency of presentation. Evidence is presented to show that this difficulty can be overcome, however, by a simple training procedure that exploits monkeys' proficiency at distinguishing familiar from novel stimuli. (24 ref)—*Journal abstract.*

3883. Misra, Saroj K. & Mohanty, Banamali. (Utkal U, Bhubaneswar, India) **Effect of visual patterns and**

apparatus familiarity on locomotor exploration of albino rats. *Indian Journal of Psychology*, 1974, Vol 49(4), 285-290.—46 male Wistar rats were randomly assigned to 4 groups. Each group was given an open-field test for 6 min daily for 7 consecutive days with 1 of the 3 different kinds of visual stimulus patterns. One of these groups was subjected to an apparatus familiarization session prior to the open-field test. Results indicate that different visual stimulus patterns and familiarization with testing apparatus had no significant effects on the amount of locomotor exploration. However, apparatus familiarization retarded the rate of intra- and intersession habituations to novel and complex visual stimuli. (17 ref)—*Journal abstract.*

3886. Murphy, Lawrence R. & Brown, Thomas S. (DePaul U) **Effects of desalivation on schedule-induced polydipsia in the rat.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 309-317.—Examined the development and magnitude of schedule-induced polydipsia (SIP) in desalivate and control rats in 2 experiments. In Exp I, with 14 adult male Sprague-Dawley rats, Ss were placed on a noncontingent fixed time (FT) 60-sec schedule for 24 days. Results indicate speeded development but asymptotically lower levels of SIP in desalivate Ss compared to controls. Home cage consumption, however, was elevated in desalivate Ss. In Exp II, with 12 Ss, schedule length, pellet size, and the percentage of body weight were manipulated. Desalivate Ss consumed less fluid during each schedule condition relative to controls, but the pattern of results across schedules was similar to controls. It is concluded that (a) desalivation attenuates SIP; (b) SIP is a learned phenomenon; (c) dry mouth theories of SIP appear inadequate; and (d) the developmental aspect of the SIP phenomenon deserves additional research attention. 3889. Osborne, Francis H.; Mattingly, Bruce A.; Redmon, William K. & Osborne, Jeanne S. (Morehead State U) **Factors affecting the measurement of classically conditioned fear in rats following exposure to escapable versus inescapable signaled shock.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 364-373.—Conducted 3 experiments in which male Wistar albino rats first received 50 escapable or inescapable signaled-shock trials. Exp I ($n = 22$) employed an acquired-drive paradigm and found that inescapable shock Ss learned a hurdle-jump response to escape the signal less rapidly than did escapable-shock Ss. Exp II ($n = 24$) employed a conditioned emotional response paradigm and found

inescapable-shock Ss suppressed more when the signal was introduced in the appetitive barpressing task. Both experiments measured spontaneous activity immediately following conditioning and found no group differences. Exp III ($n = 39$) employed the same activity task and found no difference between escapable- and inescapable-shock groups when the signal was introduced into the activity task. Both groups displayed less activity than a nonshock control group during the signal. Results suggest that lack of control over the shock in the conditioning phase did not result in an increase of conditioned fear. Results are discussed in terms of a learned active-inactive predisposition to respond. —*Journal abstract.*

3890. Osborne, Guy L. & Caul, William F. (U North Carolina, Charlotte) **Y-maze avoidance performance and activity change as a function of CS quality in rats.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 183-192.—In Exp I 30 male Holtzman rats made more avoidance responses in a Y maze to a buzzer-light CS relative to either a tone-light CS or a light only CS. No evidence for CS-related differences in brightness discrimination learning of the safe arm was found. Exp II with 24 Ss, which showed that increases in activity occurred during the buzzer presentation in a nonshock situation, suggests that the Y maze results are attributable to the buzzer's capacity to elicit unlearned activity changes which increase the likelihood of appropriately initiating the running avoidance response. In interpreting avoidance performance it is important to consider the role of the CS, since CS-elicited responses may interact with task demands to determine the observed behavior. (23 ref) —*Journal abstract.*

3891. Richards, Ralph W. & Marcattilio, Anthony J. (Colorado State U) **Intermittency of reinforcement during NA trials and performance on the ambiguous-cue problem.** *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 210-223.—In 2 experiments a total of 16 White Carneaux and 6 Autosexer female pigeons were trained on the ambiguous-cue problem which is a 2-choice discrimination task involving 3 stimuli: positive (P), ambiguous (A), and negative (N). The 2 types of trials—PA (during which P and A are simultaneously present and the correct choice is P) and NA (during which N and A are simultaneously present and the correct choice is A)—were presented in mixed order; each trial terminated after 1 response. As the intermittency of reinforcement for choosing A on NA trials was increased, performance on (and acquisition of) the PA trials improved greatly and eventually equalled (and in some instances surpassed) that on the NA trials. Performance on NA trials was only slightly affected, if at all. (French summary) (23 ref) *Journal abstract.*

3892. Robinson, Ellen. (Stern Coll for Women, Yeshiva U) **Effect of crowding and litter size on several behaviors of white rats.** *Psychological Reports*, 1975(Oct), Vol 37(2), 599-606. 134 Sprague-Dawley albino rats from litters of 4, 7, or 11 were placed 1, 2, 3, or 4 cage till 60 days old. Litters of 4 were less active in an activity wheel than litters of 7 and 11 ($p < .05$), and females were more active than males ($p < .01$). Neither cage density nor litter size affected time to begin eating. Although main effects were not demonstrated in a

brightness discrimination, there was a Cage \times Sex interaction. Males housed 1/cage were slower to learn than multiply caged Ss. Possible interpretations are facilitative effects of crowding, increased incentive value of food due to home-cage competition for food, or increased activity need generated by crowded living conditions.—*Journal abstract.*

3893. Rubel, Edwin W. & Rosenthal, Morton H. (Yale U) **The ontogeny of auditory frequency generalization in the chicken.** *Journal of Experimental Psychology: Animal Behavior Processes*, 1975(Oct), Vol 104(1)(4), 287-297.—To determine if there is an ontogenetic change in stimulus coding, chickens between the day of hatching and 9-10 days old were tested using a habituation-generalization paradigm. Exp I, with 12 White Leghorn chicks, indicated that 1-day-old and 3-4 day old chicks show similar habituation of an eye-opening response to auditory stimuli in the 800-1,200 Hz range. In Exp II, with 40 Ss, the eye-opening response to a 1,000-Hz stimulus was habituated and then immediately tested using stimuli which varied between 800 and 1,200 Hz. Each age group (1 day, 3-4 days, and 9-10 days) showed a symmetrical stimulus generalization gradient around the 1,000-Hz stimulus, and the 1-day-old chicks displayed a reliably flatter gradient than either of the older groups, which did not differ. In Exp III with 23 Ss, the position of the gradients relative to the baseline was shifted without altering the relative shapes. Results allow general arousal, general auditory responsiveness, overall error rate, and metric characteristics of the independent and dependent variables to be eliminated as possible sources of the age differences in gradient shape. The changes in stimulus generalization, therefore, support the view that during normal development there is a sharpening of perceptual coding processes. (50 ref)—*Journal abstract.*

3894. Simner, Marvin L. (U Western Ontario, London, Canada) **Reinforcing properties belonging to different rates of intermittent light for the newly hatched chick.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 225-229.—While clear reinforcing properties were found in White Leghorns for all rates between 1.5 and 11.5 flashes/sec, consistent with earlier findings regarding the differential eliciting properties belonging to subfusion flicker, these reinforcing properties were strongest around the midpoint of this range. (30 ref)

3895. Stavnes, Karen & Sprott, Richard L. (Jackson Lab, Bar Harbor, ME) **Effects of age and genotype on acquisition of an active avoidance response in mice.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 437-445.—2 experiments were conducted in which 204 inbred C57BL/6J and 194 DBA/2J male mice were trained in an active avoidance jump-up task under distributed practice conditions at a variety of ages comprising a large part of their life-span. DBA 2J Ss were found to be basically an escaping strain and exhibited little change in behavior as a function of age. C57BL/6J Ss developed consistent avoidance behavior when training was initiated at 31-36 days of age. Avoidance behavior appeared to reach a peak in the 45-day-old group and progressively decreased in 145- and 560-day-old groups. Increased footshock intensity in old DBA/2J Ss enhanced escape responding without in-

creasing avoidance responding. Increased footshock intensity in old (57B1-6J) Ss enhanced avoidance responding. (26 ref)—*Journal abstract*.

3898. Topping, Jeff S.; Hofius, Davis S. & Crowe, James T. (Mississippi State U) **Adaptation to deprivation and its effect on visual discrimination performance in pigeons.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 282-284.—Following reduction to 80% of their free-feeding weights, each of 20 adult male White Carneaux pigeons was maintained at its 80% weight for 0, 10, 25, 50, or 100 days before receiving training on a horizontal-vertical visual discrimination problem. Upon reaching criterion, Ss were placed on terminal deprivation. Based on the number of days to death and percentage of free-feeding weight at death, results suggest that the Ss did adapt to their deprivation weights; however, no significant group differences were observed in days to criterion on the discrimination problem.—*Journal abstract*.

3906. Eisenberg, John F.; Collins, L. R. & Wemmer, C. (Smithsonian Inst, National Zoological Park, Washington, DC) **Communication in the Tasmanian Devil (*Sarcophilus barrisi*) and a survey of auditory communication in the marsupialia.** *Zeitschrift für Tierpsychologie*, 1975(Jun), Vol 37(4), 379-399.—The vocalizations of 2 male-female pairs of Tasmanian devils maintained at the National Zoo, Washington, D.C., were classified with respect to their probable function, and compared with the vocalizations of 10 other marsupial species. Although the auditory signals of marsupials are generally low in intensity and easily overlooked by an investigator, it appears that they are as complex as the calls of many eutherian (placental) mammals. Marsupial vocalizations are not necessarily produced in specific situations, but the 4 basic types which have been defined relate to at least 3 different functions (i.e., promoting physical contact between animals, forms of aggression, and courtship) and reflect adaptations for conveying information in several different contexts. Problems of establishing homologies among vocalizations are discussed. (German summary) (29 ref)—*P. J. Capretta*.

3915. Marcucella, Henry & Owens, Kathleen. (Boston U) Cooperative problem solving by albino rats: A re-evaluation. *Psychological Reports*, 1975(Oct), Vol 37(2), 591-598.—Previous work demonstrated that rats behave cooperatively when placed in pairs in an apparatus that requires the simultaneous emission of topographically incompatible responses to escape shock and obtain food. Not only does 1 rat prevent occurrence of shock while the 2nd obtains food, but they shift positions (mutual shifts) frequently enough to allow an equitable division of reinforcers. The present study, with 6 male Sprague-Dawley albino rats, demonstrated that both the frequency and type of mutual shifting behavior was a function of length of the chamber. Increasing the length so physical contact between pairs of Ss was impossible completely eliminated shifting behavior. Results suggest that the mutual shifting behavior was under the control of a discriminated avoidance procedure in which physical contact between Ss was essential for the maintenance of the cooperative-like behavior.—*Journal abstract*.

3916. Markow, Therese A. (Arizona State U) A genetic analysis of phototactic behavior in *Drosophila melanogaster*. II. Hybridization of divergent populations. *Behavior Genetics*, 1975(Oct), Vol 5(4), 339-350.—Used artificial selection to produce populations of *Drosophila melanogaster* which show either positive or negative phototactic behavior. Selection was carried out in the presence of various marked multiple inversions used to suppress genetic recombination. Reciprocal hybridizations between photopositive and photonegative populations of 5 different strains of flies revealed the X chromosome of *D. melanogaster* to be important in phototactic behavior regardless of conditions which restricted genetic recombination during selection.—*Journal abstract*.

3917. Meyer, Jerrold S.; Novak, Melinda A.; Bowman, Robert E. & Harlow, Harry F. (Medical U of South Carolina) Behavioral and hormonal effects of attachment object separation in surrogate-peer-reared and mother-reared infant rhesus monkeys. *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 425-435.—4 mother-reared and 4 surrogate-peer-reared monkeys were separated from their respective attachment objects at 6 mo of age and tested for the following 9 wks to determine their home-cage behavior and their pituitary-adrenocortical responses to stress. Both groups displayed a strong immediate behavioral response to separation which was characterized by increased vocalization, increased locomotion, and decreased self-play. The surrogate-peer-reared Ss showed a subsequent recovery in their levels of self-play, whereas the mother-reared Ss developed stereotypic behavior patterns. The groups displayed similar plasma cortisol responses to weekly sessions in an apparatus equipped with animated toy "monsters." Mother-reared but not surrogate-peer-

reared Ss also manifested elevated cortisol levels when an S in an adjacent cage was captured and removed for stress testing. Mother-reared Ss thus responded in a stronger and more prolonged manner to the loss of their attachment object than surrogate-peer-reared Ss. Results suggest that infant rhesus monkeys form stronger attachments to monkey mothers than to inanimate surrogate mothers.—*Journal abstract*.

3918. Milinski, M. & Curio, E. (Ruhr-U, Abteilung für Biologie, Bochum, W Germany) [Experiments on predator selection against straying from the swarm in prey.] (Germ) *Zeitschrift für Tierpsychologie*, 1975(Jun), Vol 37(4), 400-402.—Equally sated 3-spined stickleback that had a free view of stray individuals and of a swarm of *Daphnia magna* preferentially preyed upon the strays, with the resulting risk to the strays increasing with the swarm density. This applied also to situations with constant swarm numbers but varied density. Results from 2 experiments with equal swarm density suggest that prey selection is also affected by swarm number and/or volume.—*English summary*.

3919. Prevett, John P. (U Western Ontario, London, Canada) Family behavior and age-dependent breeding biology of the blue goose, *Anser caerulescens*. *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1800.

3920. Ralls, Katherine; Barasch, Charles & Minkowski, Karen. (Smithsonian Inst, Div of Mammals, Washington, DC) Behavior of captive mouse deer, *Tragulus napu*. *Zeitschrift für Tierpsychologie*, 1975(Jun), Vol 37(4), 356-378.—Reports on observations during 7 mo of a breeding colony of larger Malayan mouse deer maintained at the Bronx Zoo. Both males and (less frequently) females mark objects with the inner-mandibular (IM) gland. Males court receptive and unreceptive females by marking the back or rump with the IM gland while emitting a series of squeaks. Females have a postpartum estrus and return to estrus at about 14-day intervals unless they become pregnant. Though mothers spend little time with infants, the occurrence of a high-pitched cry from the infant brings the mother to its side. Agonistic behavior among males (biting on the ears, neck, and shoulders while emitting loud growls) was most intense when strange individuals were introduced into established groups. It is concluded that mouse deer are morphologically and motorically "primitive," and that the 4 living tragulid species appear to be similar with respect to motor patterns and social behavior. (German summary) (1/2 p ref)—*Journal summary*.

3926. Tardif, Gilman N. & Murnik, M. Rengo. (Michigan State U). **Frequency-dependent sexual selection among wild-type strains of *Drosophila melanogaster*.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 373-379. —Studied frequency-dependent sexual selection using 3 geographically isolated strains of *Drosophila melanogaster*. The Oregon-R and Canton-Special wild-type strains were essentially homogeneous, having been maintained in laboratories since 1925; the wild Macomb strain was relatively genetically heterogeneous, having been collected immediately prior to this investigation. All possible double combinations of the 3 strains were placed in separate chambers of a modified Elens-Wattiaux observation apparatus at ratios of 5:20, 12:12, and 20:5. Allowing 2 hrs observation time for each chamber, data were collected to detect mating preference between these strains. There was no sexual isolation between the strains. However, frequency dependence, where rare males have a definite mating advantage in a population, was exhibited by the strains studied. Sexual vigor appeared to be a factor when the heterogeneous Macomb strain was mated to either of the 2 homogeneous strains in equal numbers. —*Journal abstract*.

3927. Taylor, Charles E. (U California, Riverside). **Differences in mating propensities: Some models for examining the genetic consequences.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 381-393. —Describes several models of mating behavior. The rates at which matings occur are described by differential equations. When several types of males are present with several types of females, the rates are described by a system of such equations. Different modes of pair formation result in different equations, and differences in mating propensities result in different constants in the equations. 2 types of pair formation are examined, promiscuous and permanent. These models are found satisfactory when tested against observations of mating in flour beetles and houseflies. Some ways in which different mating propensities may affect the genetic structure of populations are examined in the light of these models. —*Journal abstract*.

3928. Tenaza, R. R. (U California, Div of Environmental Studies, Davis). **Territory and monogamy among Kloss' gibbons (*Hylobates klossii*) in Siberut Island, Indonesia.** *Folia Primatologica*, 1975, Vol 24(1), 60-80. —A study of the behavior of Kloss' gibbons shows that reproductive groups are monogamous families with a mean family size of 3.4 individuals ($n = 11$ families). Adults defend their territories only against members of the same sex. This intrasexual defense of territory maintains the monogamous mating system. Other social

units are unmated resident females, unmated resident males, floating males, and a courting pair. Males establish territories before mating and guard their families against predators. Females lead progression through the territory. Subadults remain peripheral to their families, but other family members tend to remain within 10 m of one another. (40 ref) —*Journal abstract*.

3930. von Schilcher, Florian & Manning, Aubrey. (U Edinburgh, Scotland). **Courtship song and mating speed in hybrids between *Drosophila melanogaster* and *Drosophila simulans*.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 395-404. —Experimental results show that the courtship song of hybrid males is identical to that of *D. simulans*, suggesting that X chromosome determination, known from the cross between *D. pseudoobscura* and *D. persimilis*, is also possible here. Wingbeat frequency of hybrids is intermediate between that of the 2 parents, demonstrating that courtship song and wingbeat frequency are inherited independently of each other. In mating tests, hybrid males court and are accepted by *D. simulans* females more than hybrid females (presumably because their song is more "acceptable" to the former). *D. melanogaster* females reject hybrid males. Hybrid females accept *D. melanogaster* males readily, hybrids less readily, and *D. simulans* least. (31 ref) —*Journal abstract*.

3931. Wechkin, Stanley. (State University Coll New York, Brockport). **Social familiarity and nip dominance in male swordtails (*Xiphophorus helleri*) and platys (*Xiphophorus maculatus*).** *Psychological Reports*, 1975(Oct), Vol 37(2), 435-438. —Tested 12 male swordtails and 12 male platys for nip dominance among familiar (tankmate) and unfamiliar (nontankmate) conspecific pairs in 4 round robin contests conducted at weekly intervals. Stable dominance relationships were found for both species, with less aggression manifested between familiar swordtail pairs, and to a lesser extent, between familiar platy pairs, than between nonfamiliar pairs. Significant correlations between physical size and dominance status were also found for both species. —*Journal abstract*.

3932. Whitney, J. M. & LaHue, R. (U Waterloo, Canada). **Reflex sensitization in the frog (*Rana pipiens*): Stimulation-independent influences.** *Psychological Psychology*, 1975(Sep), Vol 3(3), 278-280. Study of the leg-wiping reflex in the leopard frog suggests that nonspecific factors (e.g., seasonal variations in responsivity, daily handling, and sensitization of other limbs to the stimulation) are largely responsible for the enhancement through stimulation. The potential of this preparation as a system model for study of learning mechanisms is questioned.

3933. Wiley, R. Haven. (U North Carolina, Chapel Hill). **Multidimensional variation in an avian display: Implications for social communication.** *Science*, 1975(Oct), Vol 190(4213), 482-483. An analysis of song-spread displays performed in social communication by male and female carib grackles (*Quiscalus lugubris*)

revealed that 2 components of this motor coordination, beak elevation and wing elevation, varied independently. Variation in each depended strongly on the performer's social context, an indication that these components simultaneously reflected different behavioral tendencies of the performer. It is suggested that independent variation in the elements of a display can permit transmission of more information per display about the performer's behavioral state. (17 ref)—*Journal abstract*.

3934. Wiltshko, Wolfgang & Wiltshko, Roswitha. (U Frankfurt, Fachbereich Biologie, W Germany) The interaction of stars and magnetic field in the orientation system of night migrating birds: I. Autumn experiments with European warblers (Gen. *Sylvia*). *Zeitschrift für Tierpsychologie*, 1975(Jun), Vol 37(4), 337-355.—Studied direction finding in 3 species of European warblers during 3 autumn migrations to determine the importance of stellar and magnetic field information. Tests with individual birds in registration cages (equipped with automated perches) showed that (a) under clear sky in the local earth's magnetic field warblers displayed directional preferences corresponding to their expected migratory direction based on ringing recoveries; (b) when magnetic north was artificially turned by 120° to ESE, all species preferred on clear nights their migratory direction according to the magnetic field in spite of contradictory stellar information. Such findings fit a model in which the magnetic field is primary in orientation while cues from the stars take on secondary significance, especially when the primary information is received earlier. (German & Spanish summaries) (1/2 p ref)—*P. J. Capretta*.

PHYSIOLOGICAL PSYCHOLOGY

3936. Brown, Fountaine C. & Coleman, James H. Dopamine-beta-hydroxylase in nerve function and mental illness. *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 383-385.—Presents a review of recent findings on the action of dopamine-beta-hydroxylase (DBH) in man, particularly its possible role as an index of sympathetic function. The finding of extreme variability of serum DBH concentrations in humans is considered, and the merits of several assay procedures are discussed. The role of DBH in psychopathological conditions, particularly affective states, is examined. Few studies of the relation of DBH, mental illness, and psychoactive medication offer substantive evidence for the usefulness of serum DBH analyses in the detection of psychopathology. (39 ref)—*L. Gorsey*.

3937. Friedman, Richard & Dahl, Lewis K. The effect of chronic conflict on the blood pressure of rats with a genetic susceptibility to experimental hypertension. *Psychosomatic Medicine*, 1975(Sep-Oct), Vol 37(5), 402-416. Exposed 70 rats with a genetic susceptibility to experimental hypertension to a conflict situation that

resulted in food deprivation and the application of electric shock for 13 wks. Despite weekly fluctuations, a pattern emerged wherein Ss exposed to conflict usually exhibited the highest systolic blood pressures followed in order by Ss exposed to food deprivation and shock without conflict, rats food deprived, rats exposed to shock, and control Ss. (35 ref)

3938. Karacan, Ismet; Williams, Robert L.; Thornby, John L. & Salls, Patricia J. (Baylor Coll of Medicine, Houston, TX) Sleep-related penile tumescence as a function of age. *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 932-937.—Conducted a study of nocturnal penile tumescence (NPT) in 125 healthy males aged 3-79 yrs by means of EEG recordings to provide normative data on how general the phenomenon is, its range of characteristics, and how it is related to man's sexual function. Results indicate that NPT occurs consistently in a healthy male population, that its expression is significantly affected by age, that it is related to stage of psychosexual development, and that it is worthy of further investigation. Clinical experience indicates that NPT recordings are a useful, objective method of discriminating among various types of biogenic and psychogenic impotence. (28 ref)—*Journal abstract*.

3939. Laborit, H. (Hôpital Boucicaut, Paris, France) [Neurophysiological and biological bases of avoidance behavior: Somatic consequences.] (Fren) *Annales Médico-Psychologiques*, 1975(May), Vol 1(5), 573-603.—Defines the terms emotion, pulsion, and motivation from both a physiologic and psychologic point of view, and describes their basic function in preserving the organizational structure of the living organism. The role of the dorsomedian amygdala and the lateral hypothalamus in behavioral activation is traced and compared with the inhibitory function of the system composed of the septal area, hippocampus, and the lateral amygdala. The operation of these subsystems may be differentiated into (a) action on the environment and (b) reaction to the environment. A distinction is also made between the hypophyso-corticoadrenal alarm reaction and the defense reaction of the sympatho-adrenergic system. In the latter, there is a noradrenergic sympathetic reaction, brought into play by behavioral inhibition or expectation, and an adrenergic reaction that is medullo-adrenal and controlled by behavioral activation. The α effect of catecholamines and the nicotinic effect of acetylcholine are seen to have a direct role in control of the synapses, while the β effect and the muscarinic influences play a secondary role via the intermediary of cAMP and cGMP synthesis. These 2nd messengers interfere principally with neuronal protein synthesis and long-term memory. —*H. E. King*.

3940. Sewell, D. F.; Hunt, D. M. & Burnet, B. (U Hull, England) Biogenic amines in *Drosophila melanogaster* selected for differences in larval feeding behavior. *Behavioral Biology*, 1975(Oct), Vol 15(2), 213-217.—Biochemical findings in larvae of 3 strains of fly differ from those reported in studies of adult flies. Results are consistent with the view that similar behavioral phenotypes may arise from different genetic and biochemical bases.

Neurology & Electrophysiology

3941. **Beuerman, R. W.** (U Washington, Seattle) **Slow potentials of the turtle olfactory bulb in response to odor stimulation of the nose.** *Brain Research*, 1975, Vol 97(1), 61-78.—Odor stimulation of the nose in the box turtle and the gopher tortoise produced a characteristic series of slow potentials in the olfactory bulb which were referred to as the odor-evoked response (OER). When recorded with direct coupling, the OER had 3 components: Wave I, a short duration monophasic event; Wave II a long duration variation in the DC potential; and Wave III, an oscillatory potential superimposed on Wave II. Waves I and II were negative at bulbar surfaces receiving olfactory input and positive deep within the bulb. This series of potentials could be evoked by 3 methods of odor stimulation: large puffs delivered from odorant test bottles, small puffs delivered from a syringe, and continuous flow with concentration and nasal flow rate parameters controlled by an olfactometer. Odorant concentration also directly affected the response amplitudes of all 3 wave components. The amplitudes of Waves I and III markedly decreased with closely spaced stimulations recovering to near the initial values when the interstimulus interval was increased. Data reflect the processing of odor information from the olfactory receptors by the olfactory bulb. (51 ref)—*Journal abstract*.

3942. **Björkstrand, Pär-Ake.** (U Uppsala, Sweden) **Electrodermal responses, subject control and delay of aversive stimulation.** *Biological Psychology*, 1975(Sep), Vol 3(2), 113-120.—The aim of this study was to investigate the effect of different delays between a shock releasing motor response and shock (UCS) on the anticipatory and unconditioned skin conductance responses (SCRs) within the S-control paradigm, assuming a smaller degree of control with increasing delay. 4 groups of 12 Ss receiving the UCS with no delay, 0.5-, 2-, and 6-sec delay, respectively, between motor response and shock were run together with a control group not receiving the UCS. The latter group was included to control for the effect of the motor response on the SCR. All groups were given 20 trials with signals when to perform the motor response. Results show that no or very short delay of shock produced larger 1st-interval anticipatory responses. It was found that the effect of shock on the UCR was an increasing function of the duration of the delay, when the effect of press on the UCS magnitude was taken into account. (17 ref)—*Journal abstract*.

3943. **Blowers, G. H. & Ongley, G. C.** (U Hong Kong) **The effect of knowledge of results upon contingent negative variation in a reaction time situation with a variable foreperiod.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 257-260.—To examine the effects of knowledge of results (KR) on the contingent negative variation (CNV), the vertex EEG was recorded during 8 trials of each of 5 different foreperiods with interstimulus intervals (ISIs) of 1, 3, 5, 7, and 10 sec, in each of 2 conditions, with feedback by KR and without KR. Ss were 8 female students. Foreperiods were presented randomly from trial to trial to reduce the S's anticipation of S2 onset, but median CNVs were computed in blocks of 8 for each ISI. Results show that peak amplitudes of

the CNV increased with KR. Reaction times were shorter with KR than with no KR. However, correlations of peak CNV with reaction time were not significant. It is suggested that motivation by feedback of KR is a significant factor in CNV genesis. (21 ref)—*Journal abstract*.

3949. **Divac, Ivan.** (U Copenhagen, Inst of Neurophysiology, Denmark) **Magnocellular nuclei of the basal forebrain project to neocortex, brain stem, and olfactory bulb: Review of some functional correlates.** *Brain Research*, 1975, Vol 93(3), 385-398.—Injected horseradish peroxidase into the neocortex of 2 adult squirrel

monkeys, 27 Long-Evans rats, 2 adult tree shrews, and 1 opossum; in the brainstem of 1 squirrel monkey and rats; and in the olfactory bulb, the corpus vitreum, or the vascular system of rats. Following the cortical, brainstem, and bulbar injections, labeled cells were found (predominantly ipsilaterally) in the magnocellular nuclei of the basal forebrain: nucleus of the diagonal band, the magnocellular preoptic nucleus and nucleus basalis. The number of labeled cells was proportional to the size of the injected region. Large labeled cells were found scattered among pallidal and entopeduncular neurons in rats with cortical or brainstem injections. These neurons may be the equivalent to the nucleus basalis in other species. Implications for such processes as slow-wave sleep, drinking and eating behaviors, self-stimulation, aphagia, and a recent finding of pathological changes in perikarya of nucleus basalis of schizophrenics are discussed.—*Journal abstract.*

(Rockefeller U, Field Research Ctr, Millbrook, NY) **Auditory evoked brain responses from the parakeet: Intensity functions.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 307-311.—Collected averaged auditory evoked brain responses from the skulls of 4 male unanesthetized parakeets. These responses were collected at 8 intensities of a 1,000-Hz tone. The waveform of the evoked response was highly consistent across Ss, with a major positive deflection occurring at about 20 msec after tone onset, followed by a negative deflection at about 40 msec and a 2nd positive deflection at about 100 msec. Over the intensity range examined, there is a log-linear relation between the intensity of the stimulating tone and the size of the evoked response. Threshold estimates obtained from this evoked response data compare favorably with the behavioral threshold at 1,000 Hz for the parakeet. (29 ref)—*Journal abstract.*

3952. Gabriel, Michael; Saltwick, Steven E. & Miller, Joseph D. (U Texas, Austin) **Conditioning and reversal of short-latency multiple-unit responses in the rabbit medial geniculate nucleus.** *Science*, 1975(Sep), Vol 189(4208), 1108-1109.—5 male albino rabbits with electrodes chronically implanted in the medial geniculate nucleus (MGN) were conditioned to avoid shock signaled by a tone. A 2nd tone was randomly interspersed but did not signal shock. Neuronal activity 5-40 msec after tone onset was greater to the shock-signaling tone than to the other tone. This difference reversed when the signal value of the tones was reversed. Findings support the idea that neural activity of the MGN is involved in information processing above and beyond the function of stimulus representation traditionally assumed for structures of the primary sensory systems. Based on the finding of an acquired selectivity of sensory transmission shown by differential conditioning and the modification of the selectivity shown by reversal, it is suggested that the modifiable selectivity results from "tuning" of cells in the afferent pathway during conditioning and that this tuning effect does not

originate in the MGN, but is transmitted to the MGN over a centrifugal pathway.—*Journal abstract.*

3953. Gál, E. Martin. (U Iowa, Medical Coll, Neurochemical Research Lab) **Hydroxylation of tryptophan and its control in the brain.** *Pavlovian Journal of Biological Science*, 1975(Jul-Sep), Vol 10(3), 145-160.—Reviews the hydroxylation of the essential amino acid, levotryptophan, and the cerebral mechanisms which may control hydroxylation. Among the proposed mechanisms discussed are: (a) tryptophan availability, (b) "feedback" inhibition by serotonin at the tryptophan hydroxylase step, (c) cofactor, (d) multicompartment models, and (e) catecholamines serotonin interregulation. Some of the contradictory evidence concerning the significance of indolamines in the etiology of schizophrenia and psychoaffective disorders is presented.—*J. D. Maser.*

3954. Grobstein, Paul & Chow, Kao L. (U Chicago) **Receptive field development and individual experience.** *Science*, 1975(Oct), Vol 190(4212), 352-358.—Based on research on the development of receptive field organization in the rabbit visual cortex and the role of sensory experience in this process, several conclusions about the degree of receptive field development present before first visual experience occurs and the effects of subsequent abnormal visual experience are examined. Similarities between these findings in the rabbit and recent studies in the cat by H. B. Barlow and J. D. Pettigrew (1971, 1974) suggest that a new perspective is needed, one that recognizes receptive field development as continuing well into the time of, and being significantly influenced by, initial visual experience. Methodological considerations in receptive field research are examined, including the introduction of sampling bias by the researcher, from indefinite neurons, or from electrodes. Comparisons of rabbit findings with those in cat and monkey studies are also discussed. Data on the binocular specificity suggest that, during normal development, it is left to individual experience to establish exactly which pairs of retinal regions activate single cortical neurons. It is concluded that the normal adult functional organization is not present in the cat or rabbit cortex before the age at which eye-opening normally occurs and that the time course of the appearance of normal percentages of orientation-specific units is markedly delayed by delayed eye opening.—*L. Gorsey.*

3955. Hogan, Donald D. (Professional Audiological Labs, San Juan, Puerto Rico) **Relations of the cortical response to acoustic stimuli varying in SPL, SL, and SL_n.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 233-237.—In a study with 9 normally hearing adults, 1-ke/sec pulses were embedded in either physiological or white noise. Cortical potentials were recorded to assess response variables correlated with stimulus conditions. Pulses were either at 10, 30, or 50 db sensation level (SL) in quiet, or were in noise reduced 10, 30, or 50 db from the masked threshold when white noise was mixed with the pure tones, the latter set at 60, 80, or 100 db SL. Thus, for each suprathreshold SL (60, 80, 100 db), noise SL(SL_n) = 10, 30, and 50 db was achieved to compare with the SL = 10, 30, and 50 db in quiet conditions. Latency and amplitude features of the average evoked response varied in accordance with SL or SL_n of the pulses. A recruitment-like behavior was seen when the

pulses were presented at a moderate sound pressure level and in conjunction with white noise. —*Journal summary.*

3956. Jourdkian, Felor; Tabakoff, Boris & Alivisatos, S. G. (National Coll of Chiropractic, Lombard, IL) **Ontogeny of multiple forms of monoamine oxidase in mouse brain.** *Brain Research*, 1975, Vol 93(2), 301-308.

MAO activities in mouse brain responsible for deamination of 5-hydroxytryptamine (serotonin; 5-HT) and para-dimethylaminobenzylamine (DAB) were found to follow different postnatal developmental patterns. Other data indicate that the deamination of the 2 substrates was due to different forms of MAO and that these forms were similar to type A and type B MAO described previously in rat brain. (30 ref)

3957. Kakigi, Shoji; Hagino, Genichi; Tominaga, Daisuke & Mori, Toshiaki. (Hiroshima Shudo U, Japan) **Changes of contingent negative variation (CNV), visual evoked response, and reaction time during repeated trials in simple reaction time task.** *Japanese Psychological Research*, 1975(Jul), Vol 17(2), 106-110.—Investigated the behavioral (reaction time) and physiological (CNV and visual evoked response) bases of habituation using a simple reaction time paradigm. Each of 16 adult Ss was given a total of 200 trials with a 1,000 msec S₁-S₂ interval. Results show that the amplitude of CNV decreased and reaction time increased over the trial blocks. The visual evoked response, on the other hand, was not changed significantly. The marked habituation effect upon the CNV was observed in the terminal period of the interstimulus interval.—*Journal abstract.*

3958. Khayyat, Ghassan F.; Yu, Young J. & King, Robert B. (State U New York, Upstate Medical Ctr, Syracuse) **Response patterns to noxious and non-noxious stimuli in rostral trigeminal relay nuclei.** *Brain Research*, 1975, Vol 97(1), 47-60.—Poststimulus time histogram analysis of 2nd-order neuron responses in rostral trigeminal relay nuclei of 84 adult cats demonstrated characteristic firing patterns after noxious (tooth pulp) and nonnoxious (tooth tap) stimuli. The response to noxious stimulation was prolonged and frequently bimodal while the response to nonnoxious stimulation was brief. The same neurons were fired by electrical stimuli applied directly to nucleus caudalis but with longer latencies suggesting a contributory role of nucleus caudalis to the characteristic prolonged bimodal response pattern to noxious stimuli. Interacting noxious and nonnoxious stimuli using condition-test sequences demonstrated further stimulus mode-related changes in firing patterns. Results suggest that the nucleus caudalis contains elements which may modulate activity in rostral trigeminal nuclei by either augmenting or reducing specific firing patterns of 2nd-order neurons in rostral relay nuclei. 3959. Kitajima, Shoji; Morotomi, Takashi & Kanoh, Minami. (Hokkaido U, Lab of Clinical Psychology, Sapporo, Japan) **Enhancement of average evoked responses to brief flashes after offset of preexposed light stimulation: A critical moment.** *Vision Research*, 1975(Nov), Vol 15(11), 1213-1216.—Dim test flash disks (TFs) of 20- μ sec duration, below 0.001 mV, were exposed to 4 normally seeing male adults after termination of preexposed conditioning light disks (CLs) of 3-sec duration, 0.003 mV, with CL-TF intervals ranging from

100 to 1,000 msec. Major finding was that the critical moment was the brief period between 250 and 500 msec after the CL offset when the amplitude enhancement of the visual evoked potential to the TF occurred to the greatest extent. The result suggests that there is the facilitory process in the visual system a short time after termination of the preceding light stimulation.—*Journal abstract.*

3960. Martindale, Colin & Hines, Dwight. (U Maine, Orono) **Creativity and cortical activation during creative, intellectual and EEG feedback tasks.** *Biological Psychology*, 1975(Sep), Vol 3(2), 91-100.—Divided 32 male undergraduates into 4 groups based on their performance on the Remote Associates Test and Alternate Uses test, 2 measures of creativity. Right EEG alpha presence was monitored under basal conditions, while Ss took tests of creativity and the Culture Fair Intelligence Test and while they attempted to enhance and suppress the amount of alpha in a feedback situation. High scorers on the Alternate Uses test operated at a high percentage of basal alpha during all tests while high scorers on the Remote Associates Test showed differential amounts of alpha presence across tests, with the highest percentage of basal alpha during tests of creativity and the lowest percentage during the intelligence test. Both high creative groups tended to show increases in amount of alpha across trials when trying to suppress alpha as well as when trying to enhance it, but did not differ in overall control from the low creative groups. 3963. Mowbray, G. H.; Flower, R. W. & Bird, J. F. (Johns Hopkins U, Applied Physics Lab, Laurel, MD) **Visual cortex responses to abrupt changes in the periodicity of rapidly intermittent light.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 305-312.—Visually evoked potentials that were stimulated by period-jumps in a high-frequency modulated luminance were detected and studied experimentally in 2 adult female rhesus monkeys. A principal components analysis showed that visual responses depended remarkably simply, in shape and in amplitude, on the period-jump stimulus. The response shape was nearly invariant, except that the early part of the response showed a distinctive (though slight) dependence on the sign of the period-jump. The response amplitude was approximately proportional to the magnitude of the period-jump of a given polarity. It is suggested that these features of the evoked potentials demonstrate an intimate association with a suprafusion transient phenomenon that has been observed psychophysically in man. The experimental behavior of the visual potentials also agreed with theoretical predictions. *Journal summary.*

3964. Porter, R. & Lewis, M. M. (Monash U, Clayton, Australia) **Relationship of neuronal discharges in the precentral gyrus of monkeys to the performance of arm**

movements. *Brain Research*, 1975, Vol 98(1), 21-36. —Made recordings from 162 pyramidal tract neurons which discharged bursts of nerve impulses in characteristic temporal association with performances of a stereotyped motor task by 20 cynomolgus monkeys (*Macaca fascicularis*). Clinical evaluation of the relationship between discharges of the neurons and free movement supported the view that each cell's firing was associated with a characteristic aspect of movement performance and the contraction of a particular group of muscles. Coding of the recruitment of motor units to the movement task could have been conferred by the number of pyramidal tract neurones discharging to those motoneurone targets. A ramp of "recruitment" of pyramidal tract neurones preceded the development of a ramp of force by about 100 msec. This conclusion is supported by the observation made in a single S in which orderly discharge of precentral neurones in relation to a stereotyped movement performance was clearly evident. —*Journal abstract*.

3965. Racine, Ronald; Newberry, Francis & Burnham, W. M. (McMaster U, Hamilton, Canada) **Post-activation potentiation and the kindling phenomenon.** *Electroencephalography & Clinical Neurophysiology*, 1975(Sep), Vol 39(3), 261-271. —In 3 experiments with a total of 96 male hooded rats, potentials evoked in the hippocampus and preoptic region by single biphasic pulses applied to the amygdala were compared during recruiting, after post-tetanic potentiation (PTP), and after amygdaloid kindling. The same components were enhanced temporarily by recruiting and PTP as were enhanced permanently by kindling. Ss pretreated with tetanic stimulation required significantly fewer amygdaloid afterdischarges to develop maximal seizures. Further experiments showed that tetanic stimulation, but not recruiting stimulation, low frequency stimulation, or handling, would produce a permanent change in potentials evoked in secondary sites by single pulses applied to the amygdala. This change in evoked potential amplitude was significant but smaller than that produced by kindling. Also tetanic stimulation, but not recruiting or single pulses, facilitated subsequent kindling. (French summary) —*Journal summary*.

3967. Rust, John. (U London, Inst of Psychiatry, England) **Genetic effects in the cortical auditory evoked potentials: A twin study.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 321-327. —Conducted an experiment with 40 pairs of adult male twins to investigate the extent of genetical determination in the cortical auditory evoked potential. Tonal stimuli of 1 sec duration, at an intensity of 95 db and a frequency of 1,000 c/sec, were used. The interstimulus interval was 33 sec, and the bipolar evoked potential was measured between the Cz and T3 scalp positions. The reliability of the 7 latency and amplitude measures was

also calculated; this was taken into account in the subsequent genetic analysis. The biometrical genetical approach, which gives maximal information particularly on small samples, was used to analyze the data. A strong genetic influence was found on all the amplitude scores. The environment made no significant contribution to these. For the latencies, there was some evidence for a genetic effect; however, this was not very strong and is interpreted as being due to between-family environmental effects. —*Journal summary*.

3968. Spunda, J.; Radil-Weiss, T. & Radilová, J. (Czechoslovak Academy of Sciences, Inst of Physiology, Prague) **A technique for on-line classification of evoked potentials into two groups according to subjective interpretation of the stimulus.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 411-413. —Describes a technique for on-line classification of evoked potentials (EPs) into distinct groups for separate averaging according to a criterion available after the beginning of the EPs. It is suitable for analyzing psychophysiological correlations (relationship between EPs and subjective perception). The system consists of a slightly modified NTA 512 B (Hungarian) average response computer (however, any similar computer can be used in a similar way) and of an additional device. It can be used in all cases when the number of subjective judgments according to which EPs have to be classified can be limited to 2 (or 3, when, by slightly changing the system, all quarters of memory are used). —*Journal summary*.

3973. Steffen, H. (U Heidelberg, Psychiatrischen Universitätsklinik, W Germany) **Cerebral dominance: The development of handedness and speech.** *Acta Paedopsychiatrica*, 1975, Vol 41(6), 223-235.—Notes that the brain is not a conglomerate of rigid centers for specific functions but a center of variable, overlapping functional units. Due to its plasticity, the CNS is modifiable by environmental stimuli. On the basis of a given and developing nervous system, in a certain given biochemical climate, environmental stimuli shape the sensory, sensorimotor, and sensory-integrative functions. Right-handedness predominates in man due to a genetically predetermined cerebral dominance of the contralateral hemisphere. Most start out as ambilaterals, and due to a genetic "drive" and sociocultural sensory-afferent shaping, develop toward clear-cut right-handers. Modification of handedness is possible. Relatedness of speech and handedness development seems at least to be a topological, neuroanatomical phenomenon of the left hemisphere. Speech and handedness development appear to be indicators of maturation towards so-called cerebral dominance. Left hemispheric maturation in right-handers can be estimated by the assessment of the development of speech and the speech-related sensorimotor, coordinative, and integrative functions and by the degree of handedness together with the fine motor-coordinative, economic, and sequential skill of the leading hand. (108 ref)—*G. Rubin-Rabson*.

3974. Thornton, A. R. & Coleman, M. J. (U Southampton, Inst of Sound & Vibration Research, Operational Acoustics & Audiology Group, England) **The adaptation of cochlear and brainstem auditory evoked potentials in humans.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 399-406.—In a study with 6 normal-hearing Ss, the adaptation of the responses from the cochlear nerve and the auditory brainstem nuclei was investigated using a burst of 4 clicks as the stimulus. 9 experimental conditions were obtained from 3 stimulus levels (60, 70, and 80 db SL) and from 3 intervals between clicks in the burst (15, 24, and 32.5 msec). Ss were each tested 3 times for each of the experimental conditions. Various models of the adaptation of the brainstem responses are proposed which predict different results. The experiment data allowed 1 model to be selected. The results for the adaptation of the N₁ response are basically in agreement with previous work, and the more central brainstem responses showed less adaptation than the peripheral responses. These findings may be explained by postulating different adaptation mechanisms for the peripheral and central responses. The 60 db stimulus level condition gave rise to more adaptation than the 80 db level, in agreement with other studies.—*Journal summary*.

3976. Yinon, U. & Auerbach, E. (Hadassah U Hosp, Vision Research Lab, Jerusalem, Israel) **Receptive fields and firing patterns of sustained cells in the cat visual cortex.** *Vision Research*, 1975(Nov), Vol 15(11), 1245-1250.—Ten out of 82 simple, complex, and hypercomplex cells in areas 17 and 18 of the cat visual cortex responded with either rhythmic or nonrhythmic sustained firing patterns to movement stimulation. Sustained cells tended to show multimodal average response histograms with a dominant excitatory peak, indicating organizational subdivision of their receptive fields. The dimensions of the excitatory centers ranged from 1.9 to 8.8°. Ocular dominance, orientation, directional selectivity, and velocity discrimination were the same as known in regular cortical neurons. The differences between the responses to stationary and moving stimuli suggest that cells in the visual cortex can show either sustained or transient behavior, depending on the stimulus type. 3980. Crews, David. (Harvard U, Museum of Comparative Zoology) **Psychobiology of reptilian reproduction.** *Science*, 1975(Sep), Vol 189(4208), 1059-1065. Describes a series of laboratory experiments, conducted under seminatural conditions, on the interaction of internal and external factors in the regulation of the reproductive cycle of the American chameleon (*Anolis carolinensis*). 3 sets of studies were conducted on (a) the roles of various stimulus factors associated with the male in the initiation of seasonal ovarian activity in winter dormant females, (b) the internal and external stimuli to which females are exposed during the normal season breeding and the manner in which they interact to control female sexual receptivity, and (c) the physiological control of the sexual refractory period following the breeding season. Results of all studies suggest that although climatic factors stimulate seasonal ovarian recrudescence in winter dormant females, androgen-dependent male courtship behavior strongly facilitates the stimulatory effects of the environment while aggression between males inhibits the initiation of ovarian activity; this modulation appears to be the result of differential effects of the male's behavior patterns on gonadotropin secretion in the female. Evidence also suggests that the atretic follicle plays an important role in

maintaining female refractoriness to internal and external factors that would otherwise stimulate inappropriate ovarian growth during the fall. This is the 1st demonstration of the possible physiological basis of sexual refractoriness. (35 ref)—*L. Gorsey.*

3981. Ely, David J. Aversiveness without pain: Potentiation of imaginal and auditory effects of blackboard screeches. *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 295-296.—Presented 16 state hospital employees with a mixed sequence of 8 tones (T) and 8 screeches (S) produced by scratching a blackboard. 8 Ss were told how the screeches were produced (Group I), while 8 were informed of the mixed sequence (Group II). In Group I, palmar skin potentials increased to S and remained the same to T with repeated presentations. In Group II, the difference between S and T remained constant over repeated presentations. Only 4 Ss reported having gooseflesh or unpleasant sensations. The combined effect of the screech and information regarding the way screech was produced appeared to be one of sensitization over repeated presentations.—*Journal abstract.*

3982. Jennings, J. Richard. (Walter Reed Army Inst of Research, Washington, DC) Information processing and concomitant heart rate changes in the overweight and underweight. *Physiological Psychology*, 1975(Sep), Vol 3(3), 290-296.—2 possible interpretations of B. C. Lacey and J. I. Lacey's (1974) hypothesized relationship between cardiac acceleration and "mental elaboration" were explored in 24 overweight and 24 underweight college students. The relative contribution of cognitive manipulation and memory requirements to cardiac change was investigated in 5 tasks. Several aspects of the results suggested that memory requirements were related more closely than cognitive manipulation to cardiac changes during task performance. However, since rankings of the tasks in terms of both memory load and energy demands were significantly related to the cardiac changes, a single factor interpretation of the cardiac effects was not justified. Body weight effects for both cardiac deceleration and memory errors were dependent upon the difficulty of the tasks. Relative to the underweight, the overweight showed greater deceleration with low difficulty and more errors with high difficulty items. Results suggest a relationship between heart rate change and memory demands and a limitation upon the generality of S. Schacter's (see PA, Vol 46:4450) concept of sensory binding in the obese. 3983. Jolley, Alan & Adam, Jan H. (University Coll, Cardiff, England) Gestational stress: Effects on open-field behaviour and heart rate reactivity in rat offspring. *Biological Psychology*, 1975(Nov), Vol 3(3), 231-236.

Recorded home-cage heart rate (HR) and open-field defecation, ambulation, rearing, and HR in the offspring of 20 female rats of the Carworth CFE strain who had been exposed to stress during gestation. Compared with controls, experimental Ss showed no significant differences in ambulation and rearing, while defecation was significantly lower. The only significant finding on HR was an increase from home cage to open-field level in the experimental group. Results confirm previous findings that illumination level is a useful independent variable in

gestational stress studies and suggest that different types of HR measure yield a similar picture of the HR-defecation relationship, which appears to be a negative function. Traditional assumptions about the emotional-ity construct are questioned.—*Journal abstract.*

3984. Kostowski, Wojciech; Tarchalska-Krynska, Bozena & Markowska, Lucyna. (Medical Academy of Warsaw, Inst of Physiological Sciences, Poland) Aggressive behavior and brain serotonin and catecholamines in ants (*Formica rufa*). *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 717-719.—Experiments demonstrated that concentrations of both serotonin and adrenaline were higher in ants that displayed aggressiveness (interspecific and intrageneric) while concentrations of noradrenaline were decreased. Results are similar to those in higher animals and suggest that the response may be mediated by changes of intermediate hormonal messengers. (17 ref)

(Czechoslovak Academy of Sciences, Lab of Animal Physiology & Genetics, Prague) Changes of carbohydrate metabolism during satiety and after varying periods of fasting in rats adapted to intermittent starvation. *Physiologia Bohemoslovaca*, 1974, Vol 23(3), 271-276.

3986. Leigh, Hoyle & Hofer, Myron A. (Yale U, Medical School) Long-term effects of preweaning isolation from littermates in rats. *Behavioral Biology*, 1975(Oct), Vol 15(2), 173-181.—12 male Wistar rats who were isolated from littermates on the 12th postnatal day were weaned on the 21st day and housed individually till adulthood. Comparison groups consisted of 9 Ss isolated only after weaning and housed with littermates before and after weaning. In adulthood, reaction to handling, social preference, resting heart rate (HR), HR response to an air blast, HR response to a strange rat introduced to home cage, and gastric ulceration after immobilization were tested. The prewean isolates were significantly different from the comparison groups in the reaction to handling, social preference, and in the immediate HR change following the introduction of an intruder. The prewean isolates were more reactive to handling, preferred to be near a single adult rat, and showed less cardioacceleratory responses to intrusion. Results indicate that the altered early social relationships produced by reduction of litter size to a single pup during the socialization period before weaning can have distinct long-term effects on behavior, social preference, and physiologic response in adult rats. *Journal abstract.*

3987. Macrides, F.; Bartke, A. & Dalterio, S. (Worcester Foundation for Experimental, Shrewsbury, MA) Strange females increase plasma testosterone levels in male mice. *Science*, 1975(Sep), Vol 189(4208), 1104-1106.—Male house mice paired with a normal female for 1 wk did not have higher plasma testosterone levels than males that remained in all-male groups, but paired males had markedly elevated testosterone levels 30-60 min after the resident female was replaced by another female. Elevation of testosterone levels in these males was similar to that in isolated males paired with a female, did not depend on copulation with the strange female, occurred under housing conditions that allowed continuous exposure to the odors of other females and males, and did not occur when the resident female was

replaced by another male for 30-60 min. The elevation thus appears to be a specific endocrine response to an encounter with a strange female. Results, along with previous findings suggesting that strange males affect endocrine function in females, indicate that bisexual encounters are likely to produce endocrine changes in members of both sexes.—*Journal abstract*.

3988. McCanne, Thomas R. & Sandman, Curt A. (Northern Illinois U) **The impact of two different reinforcers on conditioned operant heart-rate acceleration and deceleration.** *Biological Psychology*, 1975(Sep), Vol 3(2), 131-142.—The effects of 2 types of reinforcers on operant heart-rate (HR) acceleration and deceleration conditioning were examined in 10 paid male undergraduates over a number of sessions. The initial use of monetary reinforcement facilitated discriminative pretrial to trial HR acceleration during sessions utilizing both monetary reinforcement and visual feedback. The initial use of visual feedback did not produce such discriminative control, but the subsequent use of monetary reinforcement resulted in increases in pretrial and trial HR over sessions. No effects due to type of reinforcement were noted for HR deceleration. Increases and decreases in cardiovascular functioning were imposed upon a background of increased skin responding. The cardiovascular responses that developed over sessions appeared to be relatively independent of changes in skin response. (19 ref)—*Journal abstract*.

3990. Redmond, D. Eugene et al. **Menstrual cycle and ovarian hormone effects on plasma and platelet monoamine oxidase (MAO) and plasma dopamine-beta-hydroxylase (DBH) activities in the rhesus monkey.** *Psychosomatic Medicine*, 1975(Sep-Oct), Vol 37(5), 417-428.—Studied DBH and MAO activity in 6 female rhesus monkeys during 3 complete menstrual cycles. The same monoamine enzymes of 7 bilaterally ovariectomized females were compared with a group of controls. A difference was found in platelet MAO between a mid-menstrual-cycle peak and a perimenstrual trough in these Ss, while plasma MAO was unchanged. DBH showed an inverted cyclical variation to that demonstrated by platelet MAO. The ovariectomized Ss showed significant differences from the controls, confirming the effects of the ovarian sex steroid hormones on platelet MAO and plasma DBH. The variation in these peripheral enzymes may be reflective of changes in brain monoamine systems, which may play some role in the behavioral changes observed during the menstrual cycle in primates. 3995. Tuch, Richard H. **The relationship between a mother's menstrual status and her response to illness in her child.** *Psychosomatic Medicine*, 1975(Sep-Oct), Vol 37(5), 388-394.—From over 1,500 women who brought children to a Los Angeles pediatric outpatient department during a 1-mo period, 140 were randomly selected and interviewed to determine whether a woman's menstrual status (her position within the menstrual cycle) affects the way she responds to illness in her child. Results show that paramenstrual women (those who were about to have or who were having their period) were more apt to bring their children to the clinic than women between periods (intermenstrual women). Children brought in by paramenstrual women were considered to be less sick, to be suffering from different types of illnesses, and to have been sick for a shorter period of time than children brought in by intermenstrual women. Findings suggest that paramenstrual and intermenstrual women have different motivations for bringing their children to the doctor.—*Journal abstract*.

4000. Mishra, Ram K.; Demirjian, C.; Katzman, R. & Makman, M. H. (Albert Einstein Coll of Medicine, Yeshiva U) **A dopamine-sensitive adenylate cyclase in anterior limbic cortex and mesolimbic region of primate brain.** *Brain Research*, 1975, Vol 96(2), 395-399.—Investigated the presence and properties of adenylate cyclase activity in homogenates of the primate anterior limbic cortex and subcortical limbic regions (nucleus accumbens and olfactory tubercle) using 7 rhesus monkeys and 1 long-tailed monkey (*Cebus appella*). Dopamine (DA) caused a greater than 2-fold stimulation of enzyme in anterior limbic cortex, olfactory tubercle, and nucleus accumbens. The adenylate cyclase from the anterior limbic cortex was stimulated by concentrations of DA as low as 10^{-6} M– 10^{-4} M. Isopropyl norepinephrine and norepinephrine required at least a 1,000-fold greater concentration to obtain an equivalent effect to DA. Results suggest that DA and other DA agonists interact specifically with the postsynaptic DA receptors and in turn stimulate adenylate cyclase associated with such receptors. The study demonstrates for the first time the presence of a specific DA receptor–enzyme system in the primate limbic cortex which is influenced by antipsychotic drugs. Implications for evidence of a biochemical basis of schizophrenia are noted. (18 ref)—*L. Gorsey.*

PHYSIOLOGICAL INTERVENTION

4006. Adams, Anthony J. et al. (U California, School of Optometry, Berkeley) **Alcohol and marijuana effects on static visual acuity.** *American Journal of Optometry & Physiological Optics*, 1975(Nov), Vol 52(11), 729-735.—Measured static visual acuity at 2 contrast levels (12 and 49%) in 10 18-28 yr olds in a double-blind experiment involving 5 drug conditions of alcohol and marijuana (0.5 ml and 1.0 ml/kg body weight of 95% ethanol, 8 and 15 mg δ -9-tetrahydrocannabinol (THC), and a placebo). Results show no statistically significant change in static visual acuity for any of the dose levels at any of the measurement times up to 6 hrs following drug ingestion; this is sharply contrasted with the marked decrements in acuity found in the same Ss under the same drug conditions when the targets were in motion and required coordinated eye movements for their resolution.—*Journal abstract.*

4007. Akil, Huda & Liebeskind, John C. (Stanford U, Medical School) **Monoaminergic mechanisms of stimulation-produced analgesia.** *Brain Research*, 1975, Vol 94(2), 279-296.—Investigated the roles of cerebral monoamines (dopamine, noradrenaline, and serotonin) in stimulation-produced analgesia (SPA) in 80 male albino Sprague-Dawley rats using the tail flick test. SPA was elicited by bipolar electrodes chronically implanted in the mesencephalic periaqueductal gray matter. 4 approaches were used to alter transmission in the monoamines pathways: (a) depletion of monoamines by administration of tetrabenazine (TBZ), para-chlorophenylalanine (PCPA), alpha-methylparatyrosine (AMPT), or disulfiram; (b) replacement of depleted monoamine stores by 5-hydroxytryptophan (5-HTP) or levodopa in combination with a peripheral decarboxylase inhibitor; (c) potentiation of the monoamine systems using apomorphine or administration of appropriate precursors (e.g., 5-HTP) to previously untreated Ss; or (d) blockade of catecholamine receptors by haloperidol or of dopamine receptors by pimozide. Overall results suggest that dopamine and serotonin facilitate SPA, while noradrenaline inhibits it. When haloperidol was used, SPA was diminished, suggesting that the influence of dopamine in SPA is greater than that of noradrenaline. Comparisons between SPA and morphine analgesia suggest the existence of a common pain-inhibitory system in the brain activated by morphine and by focal electrical stimulation. 4010. Bonvallet, M. & Bobo, E. Gary. (UER St Antoine, Lab de Physiologie, Paris, France) Amygdala and masseteric reflex: II. Mechanism of the diphasic modifications of the reflex elicited from the "defense reaction area." Role of the spinal trigeminal nucleus (*Pars oralis*). *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 341-352.—E. Gary Bobo and M. Bonvallet (see PA, Vol 55:Issue 3) have demonstrated that long-lasting stimulation of the "amygdaloid area for the defense reaction" (basal nucleus, *pars magnocellularis*) elicits, after an initial facilitation, a delayed inhibition of the monosynaptic masseteric reflex (MR), while stimulation of the amygdalofugal fibers running in the ansa lenticularis provokes an immediate inhibition of the reflex. In the present study with 34 cats, the structure which mediates these inhibitors was identified. Using combined techniques of limited transections, localized coagulations and localized stimulation and recording, it is demonstrated that these inhibitions were mediated by the rostral portion of the spinal trigeminal nucleus, the subnucleus oralis (NO). After localized coagulation of this nucleus, or after lesions which interrupt selectively the connections between the NO and the masticatory nucleus, long-lasting stimulation of the basal nucleus elicits only well maintained facilitation of the MR. The implications of these findings are discussed. (17 ref)—*Journal summary*.

4011. Booth, D. A. & Jarman, S. P. (U Birmingham, England) Ontogeny and insulin-dependence of the satiation which follows carbohydrate absorption in the rat. *Behavioral Biology*, 1975(Oct), Vol 15(2), 159-172.—3 experiments were conducted with a total of 80 immature and adult Sprague-Dawley rats. In adult Ss, the 1st meal on restoring access to food following the complete absorption of an intragastric carbohydrate load was smaller than the meal following a nonnutritive load. The weaning S did not show this postabsorptively induced satiation. The effect did not appear until above a body weight of about 200 g. Subcutaneous injection of a moderate dose of insulin (0.2 units/kg) at the time of glucose intubation resulted in post-absorptive satiety appearing in the immature S. The inhibitor of insulin secretion, dextromannoheptulose, injected shortly before glucose intubation, considerably reduced the satiety effect in the 300-g S. It is suggested that an abundant secretion of insulin during absorption is necessary to establish the parenteral satiety signal operative under these conditions. (20 ref)—*Journal abstract*.

Each stimulus site tended to be associated with a distinctive pattern of skin conductance responses. (21 ref) *Journal abstract*

4018. Gispen, Willem H. et al. (U Utrecht, Rudolf Magnus Inst for Pharmacology, Netherlands) Influence of peptides on reduced response of rats to electric footshock after acute administration of morphine. *European Journal of Pharmacology*, 1975(Aug), Vol 33(1), 99-105. Acute treatment of female Wistar albino rats with ip morphine (10 mg/kg) resulted in a marked reduction of motor response to inescapable footshock (I-FS). Nalorphine (2 mg/kg) antagonized this action. Pretreatment with synthetic ACTH 1-24 60 min prior to

testing also inhibited this morphine-induced reduction, whereas other ACTH-like peptides lacking corticotrophic activity were ineffective. ACTH 1-24 had no effect on the response of adrenalectomized Ss to EFS after morphine. In intact Ss dexamethasone pretreatment 4 hrs prior to testing also antagonized the action of morphine on EFS. Findings suggest that ACTH 1-24 interferes with the antinociceptive action of morphine and that the integrity of the adrenal is essential for demonstration of this antagonism. 4021. Houpt, Katherine A. & Gold, Richard M. (Cornell U, New York State Veterinary Coll) **Glucoprivic (2DG) eating in rats despite knife cut induced hyperphagia.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 583-588.—2 wks after 20 female Carworth rats received parasagittal hypothalamic knife cuts, baseline eating was elevated, and 300 mg/kg ip 2-deoxy-D-glucose (2DG) did not further stimulate food intake. 5 wks postoperatively the food intake baseline had fallen, and an eating response to 300 mg/kg 2DG was now seen. In this delayed (static) phase intake was also stimulated by 150 mg/kg 2DG. 600 mg/kg did not stimulate intake in the lesioned Ss at any time, although 9 sham-operated Ss always responded positively to this high dose. The neural substrate damaged in hypothalamic hyperphagic rats does not appear to mediate eating in response to glucoprivation. The eating response is masked by high baseline intake in the dynamic phase but reappears in the static phase. (29 ref)—*Journal abstract*.

4023. Massari, V. John & Sanders-Bush, Elaine. (Vanderbilt U, Medical School) **Synaptosomal uptake and levels of serotonin in rat brain areas after p-chloroamphetamine or B-9 lesions.** *European Journal of Pharmacology*, 1975(Sep-Oct), Vol 33(2), 419-422.—In contrast to the pronounced fall in 5-hydroxytryptamine (5-HT; serotonin) levels and synaptosomal uptake caused by para-chloroamphetamine bilateral lesions of

the B-9 cell group in male Sprague-Dawley rats caused minimal regional changes, except for 35% decreases in the metathalamus-thalamus. The prolonged biochemical effects of para-chloroamphetamine are not due to a selective cytotoxic action on B-9 cells; a lateral 5-HT pathway, possibly from the B-9 cell group, may project to the metathalamus-thalamus.

4024. Miliaressa, Eleftherios; Bouchard, Andre & Jacobowitz, David M. (U Québec, Lab de Neurophysiologie, Chicoutimi, Canada) **Strong positive reward in median raphe: Specific inhibition by para-chlorophenylalanine.** *Brain Research*, 1975, Vol 98(1), 194-201.—Tested the effects of chlorpromazine, dextromethamphetamine, and para-chlorophenylalanine on self-stimulation in 22 male Sprague-Dawley rats with bipolar electrodes in the ventromedial tegmentum of the mesencephalon or in the median raphe. Results support the hypothesis that serotonin may be the basis of positive reward of the median raphe in the rat. (34 ref)

4025. Morrison, John H.; Olton, David S.; Goldberg, Alan M. & Silbergeld, Ellen K. (Johns Hopkins U) **Alterations in consummatory behavior of mice produced by dietary exposure to inorganic lead.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 389-396.—Mice suckled by 6 CD-1 mothers given tap water and by 6 mothers given a 5 mg/ml lead acetate solution during lactation were given a choice between tap water and a lead acetate solution after lactation. All offspring demonstrated an immediate aversion to the lead acetate solution. The offspring from the mothers receiving lead acetate during lactation demonstrated a greater aversion to the lead acetate solution than did the offspring from mothers receiving tap water. In addition, the lead acetate offspring drank more total fluid (tap water plus lead acetate solution) after weaning than the control offspring. Results indicate both learned and unlearned changes in motivation for fluid following ingestion of lead via the mother's milk in infancy. (19 ref)—*Journal abstract*.

4026. Neckers, Leonard M.; Zarrow, M. X.; Myers, Michael M. & Denenberg, Victor H. (U Connecticut) **Influence of olfactory bulbectomy and the serotonergic system upon intermale aggression and maternal behavior in the mouse.** *Pharmacology, Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 545-550.—In Exp I bulbectomized male and female Swiss albino mice had significantly less tryptophan hydroxylase in their brains than did sham controls. Neither 5-hydroxytryptophan (5-HTP) decarboxylase nor tyrosine hydroxylase activity was affected. In Exp II the rate of synthesis of serotonin was significantly less in bulbectomized males and females. Since bulbectomy leads to increased pup killing by female mice, the objective of Exps III and IV was to see whether the injection of 5-HTP into bulbectomized females could block this behavior. The incidence of pup killing was not influenced, but the latency to kill was significantly prolonged. Olfactory bulbectomy eliminates aggressive behavior in male mice, and the purpose of Exp V was to determine whether 5-HTP treatment could restore normal levels of aggression. No significant effect was found. Data suggest that a dual mechanism is needed to explain the behavioral abnormalities seen in the 2 sexes; the mechanism in the female appears to be

serotonergic while that in the male is still unknown. (24 ref)—*Journal abstract.*

4027. Patel, A. J.; Atkinson, D. J. & Balázs, R. (MRC, Developmental Neurobiology Unit, Carshalton, England) Effect of undernutrition on metabolic compartmentation of glutamate and on the incorporation of [14 C]leucine into protein in developing rat brain. *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 453-464. —The biochemical maturation of the brain was severely retarded in undernourished Ss, mainly as a result of a marked depression in the conversion of leucine carbon into glutamine. These biochemical effects of undernutrition were reversible: on rehabilitation from Day 21-35 the rate of conversion of leucine carbon, both into proteins and glutamate and glutamine, was restored to normal. (42 ref)

4028. Svare, Bruce & Gandelman, Ronald. (Rutgers State U, New Brunswick) Aggressive behavior of juvenile mice: Influence of androgen and olfactory stimuli. *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 405-415. —4 experiments were conducted using a total of 488 Rockland-Swiss albino mice. Results indicate that testosterone propionate (TP) administered from Day 21 through Day 50 of life enhanced the aggressiveness of castrated and neonatally TP-treated juvenile male and female Ss and, to a lesser extent, enhanced the aggressiveness of nonneonatally androgenized females. In addition, the enhanced aggressive behavior of juvenile male and female Ss was directed principally toward juvenile male but not female opponents and was inhibited by the application of urine from juvenile females to the fur of juvenile male opponents. These experiments indicate that androgen and olfactory stimuli modulate the aggressive behavior of juvenile mice in a manner similar to that of adult animals. (27 ref)—*Journal abstract.*

4029. Thornton, Everard W.; Goudie, Andrew J. & Bithell, Victoria. (U Liverpool, England) The effects of neonatal 6-hydroxydopamine induced sympathectomy on response inhibition in extinction. *Life Sciences*, 1975(Aug), Vol 17(3), 363-368. —Determined the effects of sympathectomy, induced by neonatal treatment with 6-hydroxydopamine (6-OHDA), on frustration in 11 albino rats, as assessed by response inhibition in extinction following continuous free operant reward training. Results contrast with previous reports in showing a positive effect on behavior, specifically in terms of enhanced response rate during extinction in treated Ss compared to 11 controls. Though the results are consistent with the theory of equivalence of the aversive affective states of frustration and fear, the evidence for a definitive role of the peripheral nervous system in such states is confounded by changes in central catecholamines by neonatal 6-OHDA treatment. Nevertheless, the findings provide further evidence for the importance of catecholamines in affective behavior. (29 ref)—*Journal abstract.*

4030. Wyler, Allen R.; Fetz, Eberhard E. & Ward, Arthur A. (U Washington, Medical School, Seattle) Firing patterns of epileptic and normal neurons in the chronic alumina focus in undrugged monkeys during different behavioral states. *Brain Research*, 1975, Vol 98(1), 1-20. —Presents data from a series of experiments

on the activity of single units in chronic epileptogenic alumina foci in precentral cortex of 8 undrugged rhesus monkeys. The foci contained a mixture of normal and epileptic cells, which differed consistently in their spontaneous firing patterns under various behavioral conditions, and in their responses to electrical stimulation. To the extent that both types of cells receive similar inputs, results suggest that many epileptic cells in the alumina focus are intrinsically hyperexcitable (i.e., they respond abnormally to normal inputs rather than responding normally to abnormally intense inputs). These hyperexcitable neurons may drive other cells in the focus, but activity of both may be operantly controlled. (33 ref)—*Journal abstract.*

4031. Zimmerman, Natilie H. & Menaker, Michael. (U Texas, Austin) Neural connections of sparrow pineal: Role in circadian control of activity. *Science*, 1975(Oct), Vol 190(4213), 477-479. —Surgical and chemical interference with the neural connections of house sparrow (*Passer domesticus*) pineals did not abolish the free-running rhythm in constant darkness, unlike pinealectomy. Pineals transplanted to the anterior chamber of the eye were capable of restoring rhythmicity to pinealectomized Ss in constant darkness. It is concluded that the avian pineal does not appear to be neurally coupled to other components of the circadian system.—*Journal abstract.*

Electrical Stimulation

4032. Amit, Z. & Corcoran, M. E. (Sir George Williams U, Ctr for Research on Drug Dependence, Montreal, Canada) Regulation of ethanol intake by rats with an induced preference for ethanol. *Neuropharmacology*, 1975(Sep), Vol 14(9), 685-691. Attempted to characterize the nature of ethanol preference acquired by 21 male Wistar albino rats after 30 daily sessions of hypothalamic stimulation. It was observed that Ss which acquired ethanol preference following hypothalamic stimulation continued to ingest significant amounts of ethanol even after it was adulterated with 0.05% quinine hydrochloride. None of the ethanol-preferring Ss exhibited any signs of withdrawal when ethanol presentations were terminated following 73 days of ethanol ingestion. The ethanol-preferring Ss were extremely accurate in regulating the amount of absolute ethanol ingested when the concentration of solutions presented to them was systematically varied. Data are discussed in terms of the specificity of the phenomenon and possible shifts in preference aversion taste functions. (17 ref)—*Journal abstract.*

4033. Atrens, D. M. et al. (U Sydney, Australia) The motivational properties of electrical stimulation of the guinea pig diencephalon. *Behavioral Biology*, 1975(Oct), Vol 15(2), 149-158. —Investigated the anatomical distribution of electrical stimulation effects on reward, aversion, elicited behaviors, rebound behaviors, and inhibition of feeding in and around the hypothalamus of 28 guinea pigs. The medial forebrain bundle was found to be a principle focus of both reward and aversion effects, whereas the medial hypothalamus evidenced relatively weak reward and aversion effects that were indistinguishable from those observed in the medial forebrain bundle. Stimulus-bound behaviors were ob-

tained from sites in the lateral hypothalamus, medial hypothalamus, thalamus, and substantia nigra. Rebound behaviors and inhibition of feeding had a low probability of occurrence and were anatomically poorly differentiated. Implications of these data for the problem as to why animals terminate rewarding intracranial stimulation and for theories of anatomical differentiation of hypothalamic motivational functions are discussed. (17 ref) —*Journal abstract.*

4034. Bobo, E. Gary & Bonvallet, M. (UER St Antoine, Lab de Physiologie, Paris, France) **Amygdala and masseteric reflex: I. Facilitation, inhibition and diphasic modifications of the reflex, induced by localized amygdaloid stimulation.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 329-339. —The changes in amplitude of the monosynaptic masseteric reflex (MR), induced by stimulation of the amygdaloid area for the defense reaction (N. basalis, par magnocellularis) and in other subdivisions of the amygdaloid complex, were studied in 49 cats with spinal section maintained under Flaxedil (gallamine). Simultaneously, the effects of stimulation on the tonic activity of the masseteric nerve were observed. A maintained facilitation of the MR was elicited by stimulation of the lateral nucleus, the parvocellular portion of the basal nucleus and the cortical nucleus, while the reflex was inhibited during stimulation of the medial-most portion of the posterior amygdala. Diphasic changes of the MR amplitude (initial facilitation followed by delayed inhibition) were regularly observed when stimulating the magnocellular portion of the basal nucleus. These diphasic changes were closely correlated with the previously described diphasic respiratory and cardiac responses elicited from the same area. The initial facilitation probably corresponds to the "alerting" stage of the defense reaction and the delayed inhibition, associated with cortical, respiratory, and cardiac activation, to the "defensive" stage of the reaction. Stimulation of the same area also provoked tonic or rhythmical discharges of the masseteric motoneurons which frequently occurred during the delayed inhibition of the MR. The main efferent pathway mediating these motor effects was probably the ansa lenticularis. (22 ref) —*Journal summary.*

4036. Cullen, N. & Goddard, G. V. (Dalhousie U, Halifax, Canada) **Kindling in the hypothalamus and transfer to the ipsilateral amygdala.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 119-131. —Delivered a single burst of electrical stimulation daily to 1 of 2 bipolar electrodes implanted in the hypothalamus and amygdala of each of 55 male Wistar albino rats, with the hypothalamic location varying between Ss. This stimulation was repeated and electrographic afterdischarge pattern recorded until 2 behavioral convulsions occurred or 100 trials occurred with no afterdischarge. At this point stimulation was switched to the 2nd structure. It was found that all regions of the hypothalamus kindled (developed afterdischarge and eventual behavioral convulsions) at approximately the same rate except the

posterior lateral hypothalamic area which did not kindle at all. The kindling rate of the amygdala was similar to that of the hypothalamus, although the hypothalamus required a greater amount of stimulation before afterdischarge threshold was reached. The afterdischarge pattern was of greater amplitude and was more rhythmic in the amygdala regardless of stimulation site. It is proposed that, during hypothalamic stimulation, kindling results from remote activation of the amygdala via anatomical connections from the point of stimulation. —*Journal abstract.*

4037. Franklin, K. B. & Herberg, L. J. (Inst of Neurology, London, England) **Self-stimulation and noradrenaline: Evidence that inhibition of synthesis abolishes responding only if the "reverse" pool is dispersed first.** *Brain Research*, 1975, Vol 97(1), 127-132. —Although noradrenaline (NA) is thought to play a critical role in electrical self-stimulation, suppression of NA synthesis by injection of the dopamine- β -hydroxylase inhibitor, FLA-63 (25 mg/kg), had little or no effect on response rates in 28 male Wistar rats. But 3 or 5 days after prior reserpinization, FLA-63 in the same dosage suppressed or profoundly depressed self-stimulation without eliciting signs of general incapacity. Suppression of self-stimulation could be reversed by intraventricular injection of NA, indicating that the depressant effect depended specifically on NA depletion. Findings support the view that NA may play a necessary role in self-stimulation and indicate that the NA available for this purpose includes intraneuronal NA in a reserpine-sensitive reserve pool. 4039. Huang, Yung H. & Flynn, John P. (Yale U, Medical School) **Unit activities in the hypothalamus and midbrain during stimulation of hypothalamic attack sites.** *Brain Research*, 1975, Vol 93(3), 419-440. —Studied unit activity in the hypothalamus and midbrain of unanesthetized cats during electrical stimulation of the hypothalamus at sites that induced attack and at other comparable sites from which attack was not induced. The changes in the firing of units at distances from 0.7 to 1.9 mm from the site of stimulation were similar to those of units at distances from 2.0 to 5.2 mm. Although stimulation in general affected a majority of units, resulting in increases rather than in decreases of firing rates, and produced similar patterns of unit activity, stimulation at sites that induced attack affected more units, produced a greater change in unit activity and markedly increased firing rates in the lateral hypothalamus and the dorsal part of the midbrain. 4044. Lauer, Joan B. & Frommer, Gabriel P. (Indiana U/Purdue U, Indianapolis) **Patterns of disruption of a lateralized discrimination by unilateral cortical spreading depression.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 300-306.—Trained 17 male albino Sprague-Dawley rats to contact drinking spouts to the left or right of their heads in response to stimulation of the left or right trigeminal nerves. The same side group of 9 Ss contacted the spout on the same side as the stimulated nerve to get saccharin water; the opposite side group of 8 Ss contacted the spout on the side opposite to the stimulated nerve. At the start of acquisition, the same side group made more correct responses than errors of commission; the opposite side group made fewer. Unilateral cortical spreading depression increased errors of commission, errors of omission, response latency, and intertrial responding. Ss tended to respond on the spout ipsilateral to the depressed hemisphere and, for the opposite side group, on the spout on the same side as the stimulated nerve. (36 ref)—*Journal abstract*.

(U Pittsburgh, Medical School) **Attenuation of pain reactivity by caudate nucleus stimulation in monkeys.** *Brain Research*, 1975, Vol 98(1), 119-134.—Studied the effect of caudate nucleus stimulation on reactivity to painful stimuli in 3 female *Macaca speciosa* monkeys chronically implanted with electrodes in the right caudate nucleus. The force with which Ss escaped from electrocutaneous leg shock was used as a measure of pain reactivity and was decreased by caudate stimulation. Escape thresholds and latencies were not influenced by stimulation. Decreased escape force was obtained only when 50 msec trains of caudate stimulation preceded 20 msec trains of leg shock by 0-100 msec. Intershock response distributions indicated that direct motor inhibition was not responsible for the depression of escape force, and the effectiveness of a restricted range of caudate-leg stimulation intervals ruled out generalized effects on arousal. Results indicate that the effect of caudate stimulation is to reduce the affective components of pain elicited by noxious electrocutaneous stimuli. (63 ref)—*Journal abstract*.

4049. Redgrave, Peter & Horrell, R. Ian. (U Hull, England) **The effects of medial hypothalamic stimulation on escape from footshock.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 133-147. In 3 experiments, electrodes were chronically implanted into the medial hypothalamic area of a total of 15 male hooded rats. Escape latencies, motivated by electrical stimulation of the brain and footshock presented both separately and together in a shuttle box, were measured. In all cases where cessation of medial hypothalamic stimulation was contingent upon escape, the combination of footshock and intracranial stimulation decreased escape latencies to a level below that motivated by footshock alone. Increases in the current stimulating the medial hypothalamus generally caused more rapid escape, both when the intracranial stimulation was presented alone and when combined with footshock. In contrast, stimulation of sites within the medial forebrain bundle region, which supported self-stimulation, systematically increased latencies to escape from footshock. Facilitation of escape behavior was no longer observed when the presentation of medial hypothalamic stimulation was nonresponse contingent. These effects are consistent with a predominantly aversive character attributable to electrical stimulation of the medial hypothalamus, but not with the view that this part of the brain mediates general behavioral suppression. 4050. Rose, James D. (Emory U, Medical School) **Response properties and anatomical organization of pontine and medullary units responsive to vaginal stimulation in the cat.** *Brain Research*, 1975, Vol 93(1), 79-93. The response properties and anatomical organization in the brain stem of 234 pontine and 60 medullary genitally sensitive (GS) neurons were studied by single unit recording in acutely prepared extracranial and anesthetized cats which were decerebrated under sodium pentobarbital anesthesia with urethane. Pontine unit responses to vaginal probing were very pronounced and stimulus bound, and involved a variety of response patterns. Most of the pontine GS neurons also responded to noxious extragenital visceral, and auditory stimuli. Results suggest that strong synaptic influence upon medullary GS neurons, possibly of midbrain origin, descends from

the lateral tegmental field of the pons. (23 ref)—*Journal abstract*.

4052. Siegel, Allan; Edinger, Henry & Dotto, Miles. (New Jersey Medical School, Newark) **Effects of electrical stimulation of the lateral aspect of the prefrontal cortex upon attack behavior in cats.** *Brain Research*, 1975, Vol 93(3), 473-484.—Studied the role of the lateral aspect of the prefrontal cortex upon quiet biting attack behavior elicited from the hypothalamus in 7 adult cats. Stimulation of 19 of 28 electrode sites sampled in the lateral prefrontal cortex produced a significant inhibition of attack behavior elicited from the hypothalamus of the ipsilateral side. Stimulation of sites in the prefrontal cortex on the side contralateral to the hypothalamus from which attack was elicited had no effect upon this response. No systematic effect of prefrontal stimulation upon flight behavior was observed. It is suggested that the lateral prefrontal cortex may inhibit attack behavior by modulating neurons in either the mediodorsal thalamic nucleus or ventral tegmental area. (26 ref)—*Journal abstract*.

Lesions

4053. Ahlskog, J. Eric; Randall, Patrick K. & Hoebel, Bartley G. (Princeton U) **Hypothalamic hyperphagia: Dissociation from hyperphagia following destruction of noradrenergic neurons.** *Science*, 1975(Oct), Vol 190(4212), 399-401.—In a study with 40 adult female Sherman rats, major differences were found between classical hypothalamic hyperphagia and the recently discovered hyperphagia syndrome resulting from destruction of the ventral noradrenergic bundle (R. M. Gold; see PA, Vol 52:405). Traditional medial hypothalamic lesions produced no detectable loss of norepinephrine, and Ss overate both in the daytime and at night, whereas destruction of the noradrenergic bundles with 6-hydroxydopamine depleted norepinephrine to 6% of normal and caused overeating only at night. Moreover, the 2 procedures were additive, not substitutive, in their effects on eating. Results argue against recent suggestions that destruction of the ventral noradrenergic bundle mediates the classical hyperphagia syndrome associated with localized ventromedial hypothalamic lesions. However, damage to noradrenergic pathways may contribute to the hyperphagia after extensive hypothalamic lesions.—*Journal abstract*.

4054. Atwell, Constance W. & Lindsley, Donald B. (Pitzer Coll) **Development of visually evoked responses and visually guided behavior in kittens: Effects of superior colliculus and lateral geniculate lesions.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 465-478.—The development of visually evoked responses (VERs) and visually guided behavior was studied in 6 kittens for 3 mo after unilateral lesions of the superior colliculus (SC) or lateral geniculate nucleus (LGN) made at an early age. The SC and LGN lesions markedly reduced or eliminated different VER components in infancy, but only the effects of LGN lesions persisted to 3 mo of age. Visual field behavior deficits occurred

following both types of lesions, but only those following SC lesions persisted to 3 mo of age. Results are interpreted in terms of the functional status of the structures mediating the VERs and behavior at the time the lesions were made. (34 ref)—*Journal abstract*.

4056. Gage, Fred H. & Olton, David S. (Johns Hopkins U) **Hippocampal influence on hyperactivity induced by septal lesions.** *Brain Research*, 1975, Vol 98(2), 311-325.—Tested female Sprague-Dawley rats for their responses to 4 stimuli to measure hyperactivity. Ss with septal lesions emitted the expected hyperactivity. Lesions of the postcommissural fornix, precommissural fornix, or anterior hippocampus, administered 16 days prior to a septal lesion, blocked the hyperactivity. Lesions localized to the medial or the lateral fibers of the fornix decreased the magnitude and duration of the hyperactivity following septal lesions but did not block it. Lesions of the posterior hippocampus-entorhinal cortex had no reliable effect on hyperactivity. Data indicate that the appearance of hyperactivity following a septal lesion depends upon a circuit involving the septum, precommissural fornix, anterior hippocampus, postcommissural fornix, and hypothalamus and document an important functional relationship between the septum, anterior hippocampus, and hypothalamus.—*Journal abstract*.

4057. Glassman, Robert B.; Forgy, Michael W.; Goodman, Joan E. & Glassman, Harriet N. (Lake Forest Coll) **Somesthetic effects of damage to cats' ventrobasal complex, medial lemniscus or posterior group.** *Experimental Neurology*, 1975(Sep), Vol 48(3, Pt 1), 460-492.—In a study with 19 cats, lesions of the thalamic ventrobasal complex or medial lemniscus were followed by deficits in tests of discrimination or orientation-localization of passively received cutaneous cues. Lesions of the posterior group were not followed by such deficits. Specificity of effect of lesions was shown by comparing the results from cutaneous tests to those of auditory, visual, and postural tests in the same Ss. Results are contrasted with those of earlier ones which showed that damage to SI cortex in cats does not cause cutaneous deficits while damage to SII and adjacent tissue does, and with work in other laboratories that also casts doubt on the idea that "lemniscal properties" are important for discriminative responding. Consideration of certain aspects of the perceptual abilities of man and lower animals suggests that the lemniscal system has too little interconnectedness to subserve sensory discriminative responding by itself. It is concluded that while lemniscal transmission of information up to the thalamic level is important for cutaneous sensation in the cat, perceptual interpretation of cutaneous information begins at the cortical level. Alternatively, certain properties of the ventrobasal complex which are not particularly "lemniscal"

cal" in nature may be important, and these are listed. (43 ref)—*Journal abstract*.

4059. Horel, James A.; Keating, E. Gregory & Misantone, Louis J. (State U New York, Upstate Medical Ctr. Syracuse) **Partial Klüver-Bucy syndrome produced by destroying temporal neocortex or amygdala.** *Brain Research*, 1975, Vol 94(2), 347-359.—The temporal neocortex was removed in 4 monkeys (*Macaca mulatta*) and 5 received amygdala destruction. 4 control Ss received skin and muscle incisions. Ss were compared on a visual pattern discrimination task, a food-nonfood discrimination, and a rating scale that measured agonistic and approach behavior. Only the cortical lesion disrupted retention of the visual pattern task, and neither lesion disrupted performance of the food-nonfood task. Both lesions produced oral behavior, increased reaction to stimuli, and decreased emotionality. Thus, the major symptoms of the Klüver-Bucy syndrome can be produced by destroying either the temporal neocortex or the amygdala. (51 ref)—*Journal abstract*.

GTN lesions significantly reduced the 5-hydroxytryptamine (5-HT) concentration of the diencephalon, hippocampus, and remaining portion of the telencephalon. Striatal 5-HT, however, was not affected. GTN lesions enhanced activity in an enclosed field and facilitated 2-way avoidance acquisition. Pain sensitivity as measured by the flinch-jump method was not affected. Results suggest that the GTN may be the origin of ascending 5-HT fibers and may be involved in the regulation of activity level and the adaptation of an animal to aversive situations. Thus, some of the behavioral and 5-HT effects of lesions in the midbrain raphe nuclei may be due to their involvement of the GTN and associated pathways. (28 ref)—*Journal abstract*.

(DePaul U) **Behaviors emitted by rats with limbic lesions during feeding.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 231-237.—Drinking, rearing, and locomotor behaviors were affected in males, but not females, with hippocampal lesions, while amygdala lesions had no effect on these behaviors in either sex. It is concluded that hippocampal lesions interact with sex in affecting spontaneous behavior. (21 ref)

4067. Myhrer, Trond. (U Oslo, Inst of Neurophysiology, Norway) **Normal jump avoidance performance in rats with the hippocampal theta rhythm selectively disrupted.** *Behavioral Biology*, 1975(Aug), Vol 14(4), 489-498.—Investigated whether the hippocampal theta activity is necessary for the appearance of behavior with which it is normally correlated. 8 Möll-Wistar rats were trained in a 1-way active avoidance test (jump test), a performance which is usually accompanied by clear theta waves. The theta activity was then disrupted by a medial fornical lesion leaving the major hippocampal input and output systems functionally intact. By comparing pre- and postoperative jump avoidance latencies no statistically significant difference was revealed. Thus, the occurrence of theta activity was not necessary for normal jump avoidance behavior. It is suggested that the theta rhythm reflects internal hippocampal processes, and it may not be a reliable measure of the influence which the hippocampal formation exerts upon other parts of the neuronal network. (38 ref)—*Journal abstract*.

4068. Phillips, Anthony G. (U British Columbia, Vancouver, Canada) **Object-carrying by rats: Disruption by ventral mesencephalic lesions.** *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 250-262. In 22 of 30 male Wistar rats, reliable object-carrying was elicited concurrently with self-stimulation in a shuttlebox. Unilateral electrolytic and neurotoxic 6-hydroxydopamine (6-OHDA) lesions in the vicinity of the substantia nigra in 14 of the carrier Ss disrupted object-carrying in postoperative tests. As the 6-OHDA lesions reduced ipsilateral striatal tyrosine hydroxylase levels to less than 5% of the contralateral striatum, this suggests a role for the ascending dopaminergic nigrostriatal bundle in stimulation-induced object-carrying. Shuttlebox self-stimulation was unaffected by either type of lesion, and this result is interpreted as evidence for a dissociation of the neural correlates of self-stimulation and object-carrying. Implications of this finding for S. E. Gluckman and D. B. Schiff's (see PA. Vol 41 5745) biological theory of reinforcement are discussed. Furthermore, the ineffectiveness of substantia nigra lesions on ipsilateral hypothalamic self-stimulation implies that while the dopaminergic nigrostriatal bundle may be subserving

some aspects of lateral hypothalamic self-stimulation, the role is by no means an exclusive one. (French summary) (42 ref)—*Journal abstract*.

4069. Spear, Peter D. & Barbas, Helen. (Kansas State U) **Recovery of pattern discrimination ability in rats receiving serial or one-stage visual cortex lesions.** *Brain Research*, 1975, Vol 94(2), 337-346.—Trained 2 groups of 10 male hooded Long-Evans rats each on a pattern discrimination between horizontal and vertical striped stimuli which were equated for contour length and total luminous flux, and in which consistent local luminous flux cues were eliminated. In 1 group of Ss, visual cortex removals were performed in 2 stages with training between the operations. 9 of the 10 Ss were able to relearn the pattern discrimination (median of 344 trials) after the completed bilateral visual cortex removals. The 2nd group received similar bilateral visual cortex lesions in 1 stage. In agreement with previous studies, none of these Ss were able to relearn the discrimination after more than 10 times (550 trial limit) the trials required for original learning. However, several Ss with total 1-stage lesions could relearn the pattern discrimination if very extended periods of training were given. (43 ref)—*Journal abstract*.

4070. Thomka, Michael L. & Brown, Thomas S. (DePaul U) **The effect of hippocampal lesions on the development and extinction of a learned taste aversion for a novel food.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 281-284.—Results show that rats with hippocampal lesions did not differ from normals in development or extinction of the aversion, extending previous findings which show that bilateral hippocampal lesions do not interfere with the normal modulation of consummatory behaviors.

4071. Thompson, Michael E. & Thorne, B. Michael. (Mississippi State U) **The effects of colony differences and olfactory bulb lesions on muricide in rats.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 285-289.—Examination of the experimental finding that olfactory bulb damage had opposite effects on muricide in rats from 2 different colonies did not provide conclusive evidence for an artifact. Caution is advised in generalizing from studies employing rats from different colonies.

4072. Wegener, Jonathan G. (Wright Inst of Otolaryngology, Community Hosp, Indianapolis, IN) **The sound localizing behavior of normal and brain damaged monkeys.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 191-219.—Studied sound localization behavior in 24 normal and brain damaged rhesus monkeys. Unoperated Ss learned the localization response more rapidly if the response required that they move away from the sound source than if the response required that they approach a sounding buzzer. All Ss which had bilateral lesions involving prefrontal lobe cortical tissue, the supratemporal plane auditory cortex, or lateral surface cortical tissue adjacent to the supratemporal plane auditory areas, exhibited deficits in sound localizing behavior. Ss with lesions involving 80% or more of the auditory cortex had the most profound postoperative deficits. All deficits appeared to be uniquely auditory but were not necessarily deficiencies in discrimination ability. It is concluded that the deficits observed in monkeys with auditory cortex lesions are probably more profound than those

reported for cats with similar brain lesions and similar discrimination task. (52 ref)—*Journal summary*.

Drug Stimulation & Psychopharmacology

4073. Altshuler, Harold; Weaver, Sydney & Phillips, Paul. (Baylor Coll of Medicine, Houston) **Intragastric self-administration of psychoactive drugs by the rhesus monkey.** *Life Sciences*, 1975(Sep), Vol 17(6), 883-890.—Developed and tested a durable and dependable technique allowing intragastric self-administration of drugs by subhuman primates. 11 of the 15 opportunities for 8 rhesus monkeys to initiate self-administration resulted in the acquisition of the behavior. The drugs studied were pentobarbital sodium, ethanol, dextroamphetamine sulfate, and methadone hydrochloride. The acquisition of ethanol self-administration yielded relatively predictable patterns of drug intake—commonly, alternating epochs of high and low intake. The cyclical pattern was similar to the patterns of oral intake of many drugs by the human drug abuser. Because of this similarity and several other features of the model, it is concluded that the intragastric self-administration model in the subhuman primate provides a useful method to study drugs abused orally by man.—*Journal abstract*.

4074. Anisman, Hymie. **Dissociation of disinhibitory effects of scopolamine: Strain and task factors.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 613-618.—In 3 experiments it was observed that a total of 240 mice of 3 strains (A/J, DBA/2J, and C57BL/6J) differing in activity exhibited comparable levels of spontaneous alternation. Scopolamine differentially affected activity in the strains but uniformly eliminated shock-induced suppression and spontaneous alternation behavior. Data are discussed in terms of the relationship between activity and spontaneous alternation. It is suggested that scopolamine exerts its effects on spontaneous alternation via the effects on acetylcholine activity, independent of any effects on general activity levels. (25 ref)—*Journal abstract*.

4075. Bagchi, Sakti P. & Zarycki, Edwin P. (Marcy Psychiatric Ctr, Research Div, NY) **Catecholamine formation in brain from phenylalanine and tyrosine: Effects of psychotropic drugs and other agents.** *Biochemical Pharmacology*, 1975(Aug), Vol 24(15), 1381-1390.—Made in vivo and in vitro comparisons of phenylalanine and tyrosine as precursors of cerebral catecholamines in rat brain. The ratio of ¹⁴C to ³H in the isolated catecholamines [R(CA)] and tyrosine [R(TY)] was determined. The experiments in vitro indicated that the rate of phenylalanine hydroxylation, the R(CA) value, and the R(CA)/R(TY) value may be characteristic properties of specific brain regions. Several physical or chemical agents had profound effects on the hydroxylation of phenylalanine. Pretreatment of the synaptosomal-mitochondrial enzyme source with any one of several detergents or with hypotonic sucrose almost completely inhibited the hydroxylation of both substrates. In vivo, chlorpromazine, amphetamine, apomorphine, and morphine stimulated or inhibited the formation of catecholamines from (¹⁴C)phenylalanine. Results suggest that (a) the tyrosine that is formed in vitro from phenylalanine in brain tissue is not freely miscible with the endogenous

free tyrosine, (b) the hydroxylation characteristics of the phenylalanine-derived tyrosine may be distinctly different from that of the free endogenous tyrosine, and (c) phenylalanine hydroxylation may be sensitive to some psychotropic drugs in vivo. (19 ref)—*Journal abstract*.

4076. Banerjee, Anuradha; Poddar, Mrinal K.; Saha, Subhash & Ghosh, Jagat J. (Calcutta U, India) Effect of Δ^9 -tetrahydrocannabinol on monoamine oxidase activity of rat tissues in vivo. *Biochemical Pharmacology*, 1975(Aug), Vol 24(15), 1435-1436.—Results show an increase in the activity of hypothalamic monoamine oxidase induced by both acute and chronic administration of Δ^9 -tetrahydrocannabinol (THC). Since the hypothalamus is rich in monoaminergic neurons, results suggest that the central monoamine neurons are an important site of action of THC. (18 ref)

(Indiana U, Medical School, Inst of Psychiatric Research) Propranolol, 3 C-morphine accumulation and avoidance: Peripheral and central variables. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 701-704.—Results in male rats suggest a substantial peripherally mediated component which might prevent the delivery of morphine to opiate receptors in the brain. The degree to which propranolol might alter morphine metabolism and excretion remains unknown. Data support the role of central variables in the interaction of the 2 compounds. (19 ref)

4080. Bond, Nigel W. & di Giusto, Eros. (Macquarie U, School of Behavioral Sciences, North Ryde, Australia) Changes in open-field behavior following short-term alcohol ingestion by rats. *Psychological Reports*, 1975(Oct), Vol 37(2), 575-578.—24 adult male Wistar rats were reduced to 70% of their free-feeding body weight and then randomly divided into an experimental and a control group. The former was placed on a liquid diet consisting of alcohol plus Sustagen for 4 2-day periods, interspersed with 3 2-day periods of a liquid diet containing Sucrose plus Sustagen. The latter group which was pair fed with the experimental group received the latter diet only. An 8-day period followed in which all Ss were fed their normal laboratory diet ad lib. All Ss were subsequently tested for differences in activity and defecation in an open field for 15 min/day every other day for 3 days. Results show that short-term alcohol ingestion can lead to residual behavioral changes, an enhancement of the activating effects of novel stimuli on locomotor activity which were independent of emotional responding or nutritional deficiencies.—*Journal abstract*.

4082. Braestrup, Claus; Andersen, Henning & Randrup, Axel. (Set Hans Mental Hosp, Central Lab, Roskilde, Denmark) The monoamine oxidase B inhibitor

deprenyl potentiates phenylethylamine behaviour in rats without inhibition of catecholamine metabolite formation. *European Journal of Pharmacology*, 1975(Nov), Vol 34(1), 181-187. Investigated the mechanisms of levo-deprenyl, which has been reported to have antidepressant properties, in male SPF Wistar rats. Levo-deprenyl, a type B MAO inhibitor, was compared to clorgyline, an MAO A inhibitor, with regard to its inhibitory effect on the formation of 3 major catecholamine metabolites: homovanillic acid (HVA), dihydroxyphenylacetic acid (DOPAC), and 3-methoxy-4-hydroxyphenylglycol (MOPEG) in the rat brain in vivo. The 2 drugs showed no difference in the dose-response pattern of all 3 metabolites. Clorgyline inhibited the formation of HVA, DOPAC and MOPEG with a median effective dose (ED_{50}) of about 0.2 mg/kg and deprenyl inhibited with an ED_{50} of about 15 mg/kg (subcutaneously). This result indicates that the metabolites of both dopamine and noradrenaline are formed by the same type of MAO, probably type A. Antidepressant properties of deprenyl seem to be independent of catecholamine deamination. Deprenyl but not clorgyline (2 or 8 mg/kg) potentiated the stereotyped sniffing behavior induced by B-phenylethylamine, a specific substrate for type B MAO. Deprenyl was 10,000 times less potent than desmethylinipramine as inhibitor of noradrenaline uptake in crude synaptosomes from the occipital cortex of rat brain. Inhibition of noradrenaline uptake is therefore excluded as a possible mechanism for the antidepressant action of levo-deprenyl. (32 ref)—*Journal abstract*.

4084. Brown, Serena-Lynn & Fial, Ronald A. (Yale U) Intracranial alpha-methyl-p-tyrosine and response for electrical brain stimulation. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 641-646.—Chemotrodes, allowing electrical and chemical stimulation of the brain at the same site, were implanted on 18 male Long-Evans rats aimed at the medial forebrain bundle of the lateral hypothalamus. After Ss were trained to barpress for electrical brain stimulation, the crystalline form of alpha-methylparatyrosine (AMPT), an inhibitor of catecholamine synthesis, was administered intracranially, and change in response rate was noted. Intracranial tyrosine administration was also tested as a control study. It was found that AMPT depressed rate of response for intracranial self-stimulation whereas tyrosine administered intracranially exhibited no such effects. This result supports data on the use of AMPT administered ip or orally and suggests a noradrenergic or dopaminergic system of reward in the lateral hypothalamus. (23 ref)—*Journal abstract*.

4085. Burks, Charles D.; Daniell, James R. & Looney, Ramon I. (Auburn U) Cholinergic mediation of instrumental and consummatory behaviors. *Psychological Reports*, 1975(Oct), Vol 37(2), 579-588. Schedule-induced polydipsia was instated in 8 male albino rats using FR 100 and fixed-time schedules of reinforcement. Both schedules were effective in producing schedule-induced polydipsia when water was concurrently available. Ss

received ip injections of 3, 6, and 9 mg/kg atropine sulfate and a control injection of physiological saline according to a 4×4 design which was replicated for 2 groups of 4 Ss each. Atropine sulfate injections attenuated schedule-induced polydipsia instated on the 2 schedules. Water intake levels were suppressed to equivalent levels, regardless of schedules or preinjection intake level obtained before drugs were administered, as compared to saline controls ($p < .001$). This finding is interpreted as evidence that the polydipsia is mediated at least in part by cholinergic pathways.—*Journal abstract.*

(Merrell-National Lab, Cincinnati, OH) **Dopaminergic nature of amphetamine-induced pecking in pigeons.** *European Journal of Pharmacology*, 1975(Sep-Oct), Vol 33(2), 319-324.—Dextroamphetamine induced a pecking response in pigeons that was antagonized by chlorpromazine, haloperidol, and bulbocapnine, suggesting that the pecking response was caused by dopaminergic receptor stimulation. Other data support the conclusion that the amphetamine-induced pecking is mediated indirectly by the release of dopamine. (16 ref)

4091. Coscina, Donald V.; Goodman, Jeff; Godse, Damodar D. & Stancer, Harvey C. (Clarke Inst of Psychiatry, Section on Neurochemistry, Toronto, Canada) **Effects of handling before central 6-hydroxydopamine treatment on subsequent emotionality and neuro-**

chemical changes in rats. *Physiological Psychology*, 1975(Sep), Vol 3(3), 225-228.—5 min of daily handling 6 days prior to intracisternal 6-hydroxydopamine (6OHDA) treatment did not alter the magnitude or the time course of rage known to occur in rats after this method of chronic depletion of brain norepinephrine (NE) and dopamine (DA). Ss were 36 male albino Wistar rats. However, handling produced an apparent protective effect against the ability of 6OHDA to deplete brain DA and, possibly, NE. Since previous work has shown that this same handling regimen, instituted after the production of 6OHDA-induced rage, has pronounced taming effects, findings collectively show that handling is a potentially important variable to control in experiments concerned with the behavioral and neurochemical effects of this drug.—*Journal abstract.*

4092. Costall, Brenda & Naylor, Robert J. (U Bradford, Postgraduate School of Studies in Pharmacology, England) **Neuroleptic antagonism of dyskinetic phenomena.** *European Journal of Pharmacology*, 1975(Sep-Oct), Vol 33(2), 301-312.—Used the abnormal involuntary movements induced by intrastriatal administration of dopamine (e.g., gnawing, biting and licking reactions, and hyperactivity) as a model for investigating the effects of a variety of neuroleptics on these dyskinetic movements (e.g., haloperidol, fluphenazine, and pimozide). Results are interpreted in terms of 2 neostriatal dopaminergic mechanisms and discussed in relationship to clinical dyskinesia. (36 ref)

4093. Cowan, Alan & Macfarlane, Ian R. (Reckitt & Colman Ltd, Pharmaceutical Div, Hull, England) **Effect of propranolol on antinociceptive, tolerance- and dependence-producing properties of morphine in rodents and monkeys.** *European Journal of Pharmacology*, 1975(Nov), Vol 34(1), 87-94.—In a study with male albino MFI/Ola mice, male Sprague-Dawley rats, and male and female rhesus monkeys, racemic propranolol did not significantly affect the antinociceptive median effective dose (ED_{50}) of morphine in rodents and neither precipitated abstinence in morphine-dependent monkeys nor exacerbated the syndrome in 24-hr withdrawn monkeys. Multiple doses of propranolol did not alter the development of physical dependence on morphine in monkeys. Evidence for a possible propranolol-morphine interaction was found using the mouse tail flick test; after 8 injections of propranolol (over 4 days) mice were tolerant to normally effective doses of morphine. Concurrent injections of naloxone antagonized this effect. When propranolol and morphine were administered concurrently the morphine ED_{50} (on Day 5) was twice that of the group receiving morphine alone. Similar results were obtained with dextro-propranolol; practolol had a neutral effect. (33 ref)—*Journal abstract.*

4094. Crabbe, John C. & Alpern, Herbert P. (San Jose State U) **d-Amphetamine: Disruptive effects on the long-term store of memory and proactive facilitatory effects on learning in inbred mice.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 647-652.—Gave 155 male C57BL/6J mice 2 daily trials on an appetitively motivated successive brightness discrimination maze problem; they then received daily ip injections of saline or amphetamine for 5 days. When trained again in the maze, Ss in all amphetamine groups tended to display

impaired retention: retention was significantly impaired in the 2.0 mg/kg group. Naive Ss were treated exactly as were the pre-trained Ss except that they received no initial maze training prior to drug treatments. Ss in all naive amphetamine groups tended to display enhanced acquisition of the maze problem: acquisition was significantly enhanced in the 1.0 mg/kg group. Results could not be explained as effects of amphetamine on attentional, motivational or other performance factors. (31 ref) —*Journal abstract*

4095. Daul, Carolyn B. & Heath, Robert G. (Tulane U, Medical School) The effect of chronic marihuana usage on the immunological status of rhesus monkeys. *Life Sciences*, 1975(Sep), Vol 17(6), 875-882.—Plasma immunoglobulin levels were decreased and in vitro lymphocyte responsiveness to a mitogenic agent, Concanavalin A, was reduced in monkeys exposed to marihuana smoke for 6 mo. It is difficult at present to assess the significance of these effects in terms of the effect of marihuana smoking on the in vivo immunological competence of the organism. (25 ref)

4096. Dawson, John L.; Cheung, Y. M. & Lau, R. T. (U Hong Kong) Developmental effects of neonatal sex hormones on spatial and activity skills in the white rat. *Biological Psychology*, 1975(Nov), Vol 3(3), 213-229.—Examined the effects of neonatal feminization on changes in spatial and activity skills. The experiment involved 3 neonatally feminized groups of male albino Wistar rats: castration alone, estrogen alone, and estrogen-injected castrates; 1 female sample of testosterone-injected castrates, and treated and untreated male and female controls. Data provide partial support for the hypothesis that neonatal gonadectomy and opposite-sex hormones administered to male and female castrated rats would reverse the normal sex-associated abilities of the rat (higher male spatial learning and higher female activity). However, the feminization effect for the male estrogen alone and castration alone experimental groups was much greater than for the male estrogen-injected castrates. The masculinized females (testosterone-injected castrates) also had higher spatial learning and lower activity levels, while the feminized male's spatial and activity skills were also reversed. This confirms in part the extent to which neonatal gonadal sex hormones are effective at critical periods of development in programming the brain in terms of sex-associated spatial and activity skills. Adult hormonal replacement therapy administered at 12 mo of age supported the hypothesis that sex hormones in adults are mainly activational and have less marked effects than the significant directional changes obtained by these neonatal sex hormones and castration techniques. (36 ref) —*Journal abstract*

4097. Dunn, Adrian J. & Hogan, Edward L. (U Florida, Medical Coll) Brain gangliosides: Increased incorporation of (1-³H)glucosamine during training. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 605-612.—The incorporation of (1-³H)glucosamine into biochemical fractions of brain was studied in male C57Bl/6J mice trained in a conditioned avoidance jump-up task, in Ss yoked to the trained Ss, and in undisturbed Ss in their home cages. The (1-³H)glucosamine was injected subcutaneously 15 min before 15 min of training, and Ss were killed after a total pulse time of 1

hr. There was a consistent and significant increase of about 21% of the incorporation of the ³H into the brain ganglioside fraction when trained Ss were compared with quiet Ss. This increase was not observed in any of the other chemical fractions studied, including the total chloroform-methanol-soluble compounds, the nonganglioside lipids, and the chloroform-methanol-insoluble compounds. Yoked Ss showed an intermediate level of incorporation, exhibiting only a 12% increase in the ganglioside fraction. When the individual ganglioside species were analyzed, the changed incorporation was not specific. (25 ref) —*Journal abstract*

4098. Eich, James E.; Weingartner, Herbert; Stillman, Richard C. & Gillin, J. Christian. (U Maryland, Baltimore) State-dependent accessibility of retrieval cues in the retention of a categorized list. *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 408-417.—Used a state-dependent learning paradigm in which 30 male 21-34 yr old Ss encoded and recalled equivalent lists of conceptually categorized words in each of the following conditions: (a) encode following administration of a marihuana placebo—recall placebo; (b) encode placebo—recall following administration of active marihuana; (c) encode marihuana—recall marihuana; and (d) encode marihuana—recall placebo. Free recall of both words and categories was more complete in the encode marihuana—recall marihuana condition than in the encode marihuana—recall placebo condition, a finding indicative of asymmetric state-dependent learning. However, these differences were not apparent when recall was prompted with appropriate extralist retrieval cues. It is concluded that the accessibility of retrieval cues which provide access to higher-order memory units which have been encoded in the dissociated state depends on restoration of that state at the time of attempted recall. Several implications of this reasoning for future studies of the cognitive mechanism underlying human state-dependence are considered. (22 ref) —*Journal abstract*

4099. Eichelman, Burr & Barchas, Jack. (Stanford Medical Ctr, CA) Facilitated shock-induced aggression following antidepressive medication in the rat. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 601-604.—In 2 experiments a total of 156 male Sprague-Dawley rats were tested for changes in shock-induced fighting following treatment with antidepressants of both the dibenzazepine and MAO inhibitor classes of drug. Ss were retested for shock-induced fighting 3, 4, and 5 days after initial ip injections of imipramine, amitriptyline, desmethylinipramine, or saline. All 3 dibenzazepine groups showed increased levels of shock-induced fighting ($p < 0.01$). In addition, Ss were retested for shock-induced fighting 6, 30, 54, and 78 hrs following the initiation of treatment with daily injections of saline, or the MAO inhibitors: nialamide, iproniazid, and pargyline. All 3 MAO inhibitor groups showed increased levels of shock-induced fighting after 30 hr ($p < .001$). (20 ref) —*Journal abstract*

memory in capuchin monkeys. Performance on trials of 600-, 180-, and 300-sec delays was not enhanced by the drug, nor did the drug appear to cause any sensory deficits which would have been indicated by poorer performance at the 2-sec delay interval (28 ref).

4101. Elton, Robert H.; Malabu, John E.; Dau, David L. & Arnold, Raymond V. Voluntary consumption of alcohol by baboons: Effects of flavor, concentration and temperature of solution. *Journal of Studies on Alcohol* 1975(Sep), Vol 36(9), 1124-1130.—Describes 2 experiments with a total of 11 naive, captive-born, 2-4 yr old baboons which attempted to (a) demonstrate voluntary drinking of alcohol when solution temperature, concentration, and vehicle were controlled and (b) determine an optimal concentration at which Ss would self-administer the alcohol solution. In Exp I, Ss were given a test solution every other day over a 4-wk period which was made from 10% alcohol in grape or orange mixes or as bourbon and water; solutions were presented either cold (2°C) or warm (30°C). All Ss voluntarily consumed the alcohol solutions. Warm orange juice was the most preferred solution. Males drank more than females, and there was a significant correlation between dominance hierarchy position and solution consumption. Exp II demonstrated that Ss drank the greatest amounts of alcohol when it was presented as a 10-20% solution and that the volume of solution consumed at the various test concentrations (10, 20, or 30%) was generally greater with cold than with warm solutions.—L. Gorsev.

4102. Emery, Donald E. & Sachs, Benjamin D. (U Connecticut) Ejaculatory pattern in female rats without androgen treatment. *Science*, 1975(Oct), Vol 190(4213), 484-486.—In a study with 60 adult female Long-Evans rats, Ss receiving long-term estrogen treatment in adulthood displayed the species-typical motor pattern of ejaculation during copulation. This hormone treatment produced pituitary hypertrophy and concomitant pressure damage to brain areas dorsal to the pituitary, but did not cause clitoral hypertrophy. The demonstration of this ejaculatory pattern in perinatally untreated female Ss indicates that the potential for the expression of the ejaculatory or "orgasmic" pattern is not dependent on exogenous androgen at any stage of development and is more widely represented among female mammals than previously believed. 4103. Forbes, William B. (U Houston) The effect of focally administered drugs on self-stimulation of the ventral tegmental area in rats. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 437.

4104. Friedman, Eitan et al. (New York U. Medical Ctr, Neuropsychopharmacology Research Unit) Enhancement of reserpine-elicited dopaminergic supersensitivity by repeated treatment with apomorphine and α methyl-p-tyrosine. *Life Sciences*, 1975(Sep), Vol 17(6), 867-874.—Pretreatment of male Sprague-Dawley rats with reserpine (5 mg/kg/day ip for 2 days) elicited an enhanced stereotyped response following injection of apomorphine or amphetamine which persisted through the 17th day. Since apomorphine acts as a direct postsynaptic receptor agonist in dopaminergic neurons this effect may represent a postsynaptic supersensitivity. To prevent the development of supersensitivity, apomorphine was administered repeatedly during the reserpin-

ization period. Contrary to expectations, a further enhancement of supersensitivity was seen when Ss were challenged days later with apomorphine. This may be the result of presynaptic dopamine-synthesis-inhibition following apomorphine. Alpha-methylparatyrosine, but not scopolamine, repeatedly administered during the reserpinization mimicked the effect of apomorphine, supporting the concept that the potentiating effects of apomorphine are mediated presynaptically. Furthermore it is suggested that the direct presynaptic action of apomorphine, and not that mediated via cholinergic interneurons, is operant in the development of enhanced supersensitivity. (21 ref)—*Journal abstract*.

4105. Garvey, H. Lloyd & Ram, Nand. (Howard U. Medical Coll) Centrally induced hypotensive effects of β -adrenergic blocking drugs. *European Journal of Pharmacology*, 1975(Sep-Oct), Vol 33(2), 283-294.—Investigated the mechanism of the antihypertensive effects of propranolol, pindolol, and solatol using chloralose-anesthetized cats and dogs. Results suggest that the hypotensive effects of both propranolol and pindolol may be related to a reduction in the level of central autonomic control resulting from decreased levels of blood pressure, heart rate, and cardiac contractile force. (49 ref)

4106. Geyer, Mark A. et al. (U California, Medical School, San Diego) Opposite effects of intraventricular serotonin and bufotenin on rat startle responses. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 687-691.—In 2 experiments the startle responses of a total of 34 male Sprague-Dawley rats to air puffs were monitored in a stabilimeter during the iv infusion of various doses of 5-hydroxytryptamine (5-HT) or the putative hallucinogenic congener of 5-HT, 5-hydroxy-N,N-dimethyltryptamine (5-HDMT) or saline. Qualitatively opposite effects were observed, with 5-HT producing a dose-dependent decrease in responsivity and 5-HDMT increasing the magnitude of startle responses. No specific effects of either compound could be demonstrated on the presumably separable processes of sensitization and habituation. Results are discussed in the context of a central serotonergic system which facilitates behavioral inhibition and which is antagonized by indoleamine hallucinogens. (26 ref)—*Journal abstract*.

4107. Glick, Stanley D.; Cox, Russell D. & Greenstein, Stuart. (Mt Sinai School of Medicine, City U New York) Relationship of rats' spatial preferences to effects of d-amphetamine on timing behavior. *European Journal of Pharmacology*, 1975(Aug), Vol 33(1), 173-182.—Trained 12 female Sprague-Dawley rats to barpress on a DRL 16 schedule for water reinforcement. Ss were allowed to barpress on either of 2 levers (left and right), and all showed consistent side preferences. Doses (0.5-2.0 mg/kg) of amphetamine differentially affected performance under signaled and nonsignaled conditions. Performance during the nonsignaled condition was much more sensitive to a drug-induced rate increment and timing impairment. With increasing drug dosage, under both conditions, side preferences reliably increased, decreased, or remained unchanged depending upon the particular pattern of paw usage and the relationship between paw and side preferences. For the nonsignaled condition, baseline rates were related to the strength of

side preferences; lower rates and better timing performance were significantly correlated with greater preferences. Observations of barpressing behavior suggest that stereotyped motor patterns associated with side preferences might be related to mechanisms involved in timing behavior and, perhaps, in behavior controlled by internal stimuli generally.—*Journal abstract.*

4108. Goldman, Harold; Dagirmanjian, Rose; Drew, William G. & Murphy, Sharon. (Wayne State U, Medical School) Δ^9 -tetrahydrocannabinol alters flow of blood to subcortical areas of the conscious rat brain. *Life Sciences*, 1975(Aug), Vol 17(3), 477-482.— Δ^9 -Tetrahydrocannabinol (THC, 1 mg/kg) injected iv into 43 conscious, unrestrained male Wistar rats induced "cataleptoid" postures, vocalization, and, in about 1/2 of the Ss, a unique jumping behavior. During the period of cataleptoid behavior at 20 min after injection, the flows of blood to dorsal hippocampus, hypothalamus, cerebellum, and basal ganglia were reduced significantly, whereas perfusion of cortical areas was unaffected. These regional changes in flow are believed to reflect acute functional responses to THC. (38 ref)—*Journal abstract.*

4109. Goldman, Harold; Sandman, Curt A.; Kastin, Abba J. & Murphy, S. (Wayne State U) MSH affects regional perfusion of the brain. *Pharmacology, Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 661-664.—With the single exception of the occipital cortex, the flow of blood to most regions of the brains of 33 conscious, unrestrained male Wistar rats was reduced within 10 min after iv administration of alpha melanocyte stimulating hormone (α MSH). Though these effects were transitory for most regions of the brain, perfusion of cerebellum, pons and medulla, hippocampus, and parietal cortex was still significantly low by 20 min. Assuming that flow changes reflect functional changes, these early responses to α MSH suggest an explanation for the effects of this hormone in which visual learning is improved. (26 ref)—*Journal abstract.*

4110. Goldstein, Dora B. & Kakhana, Ryoko. (Stanford U, Medical School) Alcohol withdrawal reactions in mouse strains selectively bred for long or short sleep times. *Life Sciences*, 1975(Sep), Vol 17(6), 981-986.—2 lines of mice—the alcohol-sensitive long-sleep (LS) strain and the alcohol-sensitive short-sleep (SS) strain—that differ in their sensitivity to acute hypnotic effects of ethanol were tested for alcohol withdrawal reactions after a standard 3-day exposure to ethanol. The LS strain showed a much milder withdrawal reaction than did the SS. The strains did not differ in sensitivity to convulsions elicited by pentylenetetrazol. Sleep times and withdrawal reactions did not correlate in individual Ss of the genetically heterogeneous stock from which the 2 lines were derived.—*Journal abstract.*

4111. Grabowska, Maria. (Polish Academy of Sciences, Inst of Pharmacology, Krakow, Poland) Influence of apomorphine on brain serotonin turnover rate. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 589-591.—Apomorphine (5.0 mg/kg, subcutaneously) accelerated the disappearance of 5-hydroxyindoleacetic acid from the brains of ip pargyline-pretreated male Wistar rats, as well as the depletion of brain 5-hydroxytryptamine (5-HT) caused by inhibition of its

synthesis. The latter effect was abolished by spiroperidol. Results suggest that apomorphine increases the 5-HT turnover rate, secondary to the stimulation of central dopamine receptors.—*Journal abstract.*

4113. Hall, Michael E. & Mayer, Meredith A. (U Colorado) Effects of alpha methyl-para-tyrosine on the recall of a passive avoidance response. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 579-582.—Treatment with ip alpha-methylparatyrosine 4 hrs before training on a passive avoidance task altered recall in 160 female C57BL/6J mice tested 24 hrs after training. The observed alterations were dependent on the intensity of the footshock used during training. Retention of the avoidance habit was reduced by drug treatment when a footshock of 1.6 mA was employed, while retention by drug-treated Ss was enhanced when a footshock of 0.16 mA was used. No significant differences in retention were noted when a footshock of 0.8 mA or no footshock was employed. Results cannot be explained on the basis of drug-induced changes in activity or sensitivity to footshock, or to state-dependent learning. (19 ref)—*Journal abstract.*

4114. Hammond, Kenneth R. & Joyce, C. R. (Eds.). (U Colorado) *Psychoactive drugs and social judgment: Theory and research*. New York, NY: John Wiley & Sons, 1975. xvii, 278 p.—Presents a collection of 17 papers on theory, method, research, and future issues in psychopharmacology. The effects of psychoactive drugs on the human judgment, interpersonal conflict, and interpersonal learning of both hospitalized and normal Ss are examined. (43 p ref)

4115. Handley, George W. (U Tennessee) The effects of methylphenidate (Ritalin) upon performance in the successive discrimination reversal situation. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1294.

4116. Heaton, Robert K. (U Colorado, Medical Ctr, Denver) Subject expectancy and environmental factors as determinants of psychedelic flashback experiences. *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 157-165.—Assessed the roles of expectancy and autonomic arousal in inducing psychedelic flashbacks under conditions of mild sensory deprivation. 16 males who claimed to have had flashbacks (mean age, 22.3 yrs) and 16 males with extensive psychedelic drug histories but not claiming flashbacks (mean age, 23.4 yrs) participated. During the 1st experimental session, Ss were given a drug which they were told would induce flashbacks and during the 2nd, a drug which was alleged to induce only autonomic arousal. Ephedrine sulfate (50 mg) or placebo actually was given in counterbalanced order. Ss of both groups experienced many more psychedelic sensations (measured by Linton and Lang's Subjective Reaction Scale) when they expected flashbacks. Drug effect was nonsignificant. Findings support the view that flashbacks are not "caused" by psychedelic drugs, but by the tendency of some drug users to mislabel, and selectively attend to relevant aspects of

naturally occurring altered states of consciousness. (25 ref)—*Journal abstract.*

4117. Hine, Bromfield; Torrello, Marina & Gershon, Samuel. (New York U. Medical School, Neuropsychopharmacology Research Unit) **Interactions between cannabidiol and Δ^9 THC during abstinence in morphine-dependent rats.** *Life Sciences*, 1975(Sep), Vol 17(6), 851-858.—33 male Sprague-Dawley rats, each implanted with a pellet containing 75 mg morphine, were administered naloxone 72 hrs later to precipitate abstinence. 2 hrs before naloxone, Ss were pretreated acutely with either 10 mg/kg cannabidiol (CBD) or the vehicle. One hour later, an injection of the vehicle or a low dose of Δ^9 -tetrahydrocannabinol (THC) that exhibits slight efficacy in attenuating morphine abstinence signs was administered to each of the groups previously receiving the vehicle or CBD. Interactions between CBD and THC were assessed during abstinence, precipitated 1 hr after the last series of injections. CBD had little effect on abstinence scores, but significantly increased the abstinence-attenuating properties of THC. Rotational behavior (turning), induced by THC during abstinence, was also potentiated by CBD. Data extend previous reports of potentiation of pharmacological effects of THC by CBD to abstinence-attenuating properties and other effects of THC in morphine-dependent rats. (22 ref)—*Journal abstract.*

4118. Hoffmeister, Friedrich & Wuttke, Wolfgang. (Inst für Pharmakologie der Bayer, Wuppertal-Elberfeld, W Germany) **Self-administration of acetylsalicylic acid and combinations with codeine and caffeine in rhesus monkeys.** *Journal of Pharmacology & Experimental Therapeutics*, 1973, Vol 186(2), 266-275.—One group of monkeys was allowed to leverpress for iv injections of saline, another group for codeine. Saline was available 24 hrs, codeine 3 hrs/day. After leverpressing became stable, saline was replaced by acetylsalicylic acid (ASA, 2.5 and 10 mg/kg), and codeine was replaced either by ASA or by combinations of ASA plus codeine, ASA plus caffeine, ASA plus caffeine plus codeine, and by caffeine plus codeine. 2.5 mg/kg ASA generated rates of responding slightly above saline level in 3 out of 4 Ss. With 10 mg/kg ASA, self-administration behavior was below the saline level. Mixtures of ASA with codeine, when offered to Ss trained for codeine self-administration, produced decreases in the number of codeine self-injections. Codeine intake was also decreased when these Ss were pretreated with ASA (100 and 200 mg/kg) 15-180 min prior to the codeine self-administration sessions. Caffeine was not self-administered more frequently than saline, either when caffeine was offered alone or in a mixture with ASA. A mixture of caffeine and codeine was taken at lower rates than solutions of codeine alone. When the 3 drugs were offered in a mixture, rates of self-administration were lower than those generated by ASA codeine or caffeine codeine mixtures, as well as by codeine alone. Results fail to show considerable positive reinforcing properties for ASA.—*Journal abstract.*

4119. Hruska, R. E.; Thut, P. D.; Huxtable, R. J. & Bressler, R. (U Arizona, Medical Ctr) **Suppression of conditioned drinking by taurine and related compounds.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug),

Vol 3(4), 593-599.—48 male HaM/ICR Swiss mice were conditioned to respond for water reinforcements on an FR-5 schedule. Taurine, injected ip at doses of 9.0, 13.8, and 21.3 mmole/kg, produced a dose-related decrease in both the initial response rate and total number performance, reinforcements received by Ss deprived of water for 24 hrs. The structural analogs of taurine (aminomethanesulfonic acid, 3-aminopropanesulfonic acid, β -alanine, cysteamine, and glycine) also produced a hypodipsia. Doses of taurine which produced depression of responding for water reinforcements were used which produced no suppression of spontaneous motor activity, rotarod performance, Sidman avoidance, or shuttle-box avoidance. After injection, the concentration of taurine increased in the hypothalamus and medulla but not in other brain areas. It is suggested that taurine might be acting by specifically depressing areas of the hypothalamus which stimulate drinking. (22 ref)—*Journal abstract.*

4120. Hui, Koon-Sea & Roberts, Michael B. (U Saskatchewan Hosp, Psychiatric Research Unit, Saskatoon, Canada) **The effect of mepyramine on the development of morphine tolerance and physical dependence in mice.** *Life Sciences*, 1975(Sep), Vol 17(6), 891-900.—Studied the H₁ histamine receptor antagonist mepyramine (Anthisan) for its effects on the development of morphine tolerance and physical dependence in WHT/Ht stain mice. When administered ip during the induction phase of morphine administration, mepyramine inhibited the development of physical dependence, but not of tolerance. Results provide preliminary circumstantial evidence for the implication of histamine in the mechanisms of morphine physical dependence in mice. Brain histamine levels were increased 24 hrs after treatment with mepyramine. (28 ref)—*Journal abstract.*

4121. Hunter, Bruce E.; Riley, Joseph N.; Walker, Don W. & Freund, Gerhard. (U Florida, Medical Coll) **Ethanol dependence in the rat: A parametric analysis.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 619-629.—48 male Long-Evans hooded rats were maintained on liquid diets as their sole source of calories and fluid for 10, 15, 20, or 30 days. The diets consisted of 35-40% of total calories in the form of ethanol. This procedure resulted in substantial ethanol intake leading to behavioral intoxication. Blood ethanol concentrations were elevated throughout the day with a peak during the dark phase of the light cycle. The removal of ethanol resulted in evidence of physiological dependence, including behavioral manifestation of autonomic and somatic dysfunction and an increased susceptibility to audiogenic convulsions. 10 days of ethanol exposure was sufficient for the reliable induction of ethanol dependence. Further increases in ethanol exposure resulted in increased hyperexcitability as measured by susceptibility to audiogenic convulsions. The severity of withdrawal behavior was correlated with the blood ethanol concentration measured upon ethanol removal. A behavioral rating scale for the evaluation of alcohol withdrawal intensity in rats is described. (43 ref)—*Journal abstract.*

4122. Izquierdo, Ivan; Fernandes, J.; Oliveira, R. & Settinari, F. (U Federal Rio Grande do Sol, Inst de Biociências, Brazil) **Effect of daily saline, drug or blank injections on the susceptibility to the convulsant effect**

of drugs. *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 721-722. Results in female rats show that handling and blank injections had effects similar to those of injections of metrazol, strychnine, and picrotoxin, though not as pronounced. Findings indicate that the procedure of submitting rats to daily ip injections is not as unsequential as is usually thought to be, and that it may induce neurological changes.

4123. Izquierdo, Iván. (Escola Paulista de Medicina, São Paulo, Brazil) Relations between orienting, pseudo-conditioned and conditioned responses in the shuttle-box: A pharmacological analysis by means of LSD and dibenamine. *Behavioral Biology*, 1975(Oct), Vol 15(2), 193-205.—Investigated the effect of ip LSD on a total of 198 female Wistar rats submitted to habituation, pseudo-conditioning, or 2-way avoidance conditions. LSD increased orienting response in all 3 situations in a dose-dependent fashion. Dibenamine, which had a similar action of its own, did not antagonize that of LSD. In the 2-way situation, pretrial LSD increased shuttle responses at the lower dose (0.075 mg/kg) and apparently had no effect at the higher (0.3 mg/kg), and when given together with dibenamine it was depressant on both doses. Retention 7 days later was lower in all LSD groups than in water- or dibenamine-treated groups. Since LSD had no effect on retention when given posttrial, it must be concluded that it had a deleterious effect on acquisition of the shuttle response. Results indicate that orienting, pseudoconditioned shuttling, and conditioned shuttling, while they may occur superimposed, and in spite of the latter 2 being identical in external appearance, each have a distinct pharmacology of their own. This is discussed in relation to organization of aversive responses of rats in a shuttle-box depending on the context of the experimental situation. (21 ref)—*Journal abstract*.

4124. Kagan, Fred et al (Eds). (Upjohn Co, Kalamazoo, MI) *Hypnotics: Methods of development and evaluation*. New York, NY: Spectrum, 1975. 432 p. —Presents a collection of symposium papers dealing with areas of psychopharmacologic research that could facilitate the development of new and improved hypnotics. Topics include treatment of sleep disorders, methods for the clinical evaluation of hypnotics, evaluation of addiction liability, and metabolism and adverse drug effects.

4125. Kahn, Alfred J. Changes in ethanol consumption by C3H and CF1 mice with age. *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1107-1123. —Offered either water or a 3% alcohol solution for 4 wks to 102 male C3H mice, initially aged 3, 13, 20, and 60 wks, and to 76 male CF1 mice from age 10 wks until they died. Results show that differences in consumption depended on age and the rate at which response patterns to the solution developed. Response patterns of the C3H and CF1 Ss were similar with respect to the maturation and eventual decline of their aversion to alcohol. The proportion of Ss demonstrating highly aversive behavior (consumption at the preferred site less than 30% of total fluid intake) was relatively low early in life and attained a peak value of 90% at 17 wks of age in C3H mice and 70% at 40 wks of age in CF1 mice.—*Journal abstract*.

4128. Kleinlogel, Horst; Scholtysik, G. & Sayers, A. C. (Research Inst Wander, Berne, Switzerland) Effects of clonidine and BS 100-141 on the EEG sleep pattern in rats. *European Journal of Pharmacology*, 1975(Aug), Vol 33(1), 159-163.—Investigated the effects of the peripheral and central α -adrenoceptor stimulant and antihypertensive agents clonidine and BS-100-141 on EEG sleep patterns in implanted female rats and on blood pressure in pithed female Charles River rats. Whereas both compounds abolished paradoxical sleep (PS), clonidine, in contrast to BS-100-141, markedly increased the sleeping time. Both drugs caused a dose-dependent increase in the blood pressure of pithed Ss. The pressor action was abolished by the α -adrenoceptor blocking agent phentolamine but was not influenced by reserpine, indicating a direct stimulation of vascular α -adrenoceptor by both drugs. It is suggested that sedation or sleep induction by adrenergic drugs cannot be explained exclusively by an action on central α -adrenoceptors. Rather, the findings suggest that such an action may be involved in the modulation of PS. (20 ref)—*Journal abstract*.

4129. le Bars, D.; Menétreay, D.; Consellier, C. & Besson, J. M. (U Pierre et Marie Curie, Lab de Physiologie des Ctr Nerveux, Paris, France) Depressive effects of morphine upon lamina V cell activities in the dorsal horn of the spinal cat. *Brain Research*, 1975, Vol 98(2), 261-277.—Data from 27 adult cats suggest that morphine (2 mg/kg iv) induced a direct depressive action at the spinal level since it strongly reduced both spontaneous and evoked activities of lamina cells. The spontaneous firing rate and the responses elicited by natural nociceptive stimulation were decreased by 50%. These effects are specific since they are immediately reversed by administration of opiate antagonists (nalorphine or naloxone). (53 ref)

4130. Letz, Richard & Belknap, J. K. (U Texas, Austin) Simple induction and assessment of barbiturate physical dependence in the rat. *Physiological Psychology*, 1975(Sep), Vol 3(3), 249-252. —Reports on a demonstration of physical dependence to phenobarbital via an oral ingestion method in rats. Also, the utility of air-puff-elicited startle for assessing both intoxication and withdrawal effects was shown. Avoidance of phenobarbital-adulterated food was enhanced as a result of prior exposure to chronic phenobarbital intoxication and subsequent withdrawal.

The incidence of previous cerebral lesions is an important cause of severe epileptic complications. —J. F. Brennan.
4133. Malick, Jeffrey B. (ICI United States, Inc, Wilmington, DE) **Differential effects of d- and l-amphetamine on mouse-killing behavior in rats.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 697-699.—Both dextro- and levoamphetamine inhibited mouse killing in male rats, with dextroamphetamine 8 times as potent. Results suggest that amphetamine antagonized muricidal behavior primarily via noradrenergic mechanisms, and that agents which modify the level of activity at central noradrenergic receptors may significantly alter the mouse-killing response of rats. (16 ref)
4134. Martin, Joan C. (U Washington, Seattle) **Effects on offspring of chronic maternal methamphetamine exposure.** *Developmental Psychobiology*, 1975(Sep), Vol 8(5), 397-404.—25 female Sprague-Dawley derived rats were administered subcutaneous 1.0, 3.0, or 5.0 mg/kg of methamphetamine HCl or saline twice daily throughout gestation beginning on Day 1 of pregnancy. Ss were allowed to deliver normally; offspring were culled to 8 and sexed on Day 7, and weaned on Day 21. All females had viable litters except at the 5.0 mg/kg dose where 4 of 7 failed to deliver. The Ss given methamphetamine delivered earlier than did controls. Weight gain over gestation decreased as a function of increasing drug dose. No gross anomalies were visible in the offspring. Litter size decreased as a function of increased dose, and eye opening was delayed in the drug groups; the 5.0 mg/kg offspring made more conditioned avoidance responses than did the 3.0 mg/kg and saline offspring. Implications to the study of amphetamine abuse in pregnant women are noted. (17 ref) —Journal abstract.

4137. Meltzer, Herbert Y.; Daniels, Stephen & Fang, Victor S. (U Chicago, Pritzker Medical School) **Clozapine increases rat serum prolactin levels.** *Life Sciences*, 1975(Aug), Vol 17(3), 339-342.—In experiments with male Sprague-Dawley rats, clozapine markedly increased serum prolactin levels when injected ip in doses of 5, 10, 50, and 100 mg/kg. Serum prolactin levels after 5 mg/kg clozapine were significantly less than in Ss given 10, 50, and 100 mg/kg, which did not significantly differ from each other. Serum prolactin after 10 mg/kg clozapine was significantly greater than after chlorpromazine (5 mg/kg) and haloperidol (0.5 mg/kg). The increases in serum prolactin are attributed to clozapine's ability to produce dopamine blockade or to inhibit nerve impulse dopamine release, or both. The capacity of clozapine to affect brain serotonin and norepinephrine metabolism and its strong anticholinergic properties are probably not involved in its ability to increase serum prolactin. (29 ref) —Journal abstract.
4138. Montgomery, R. B. & Armstrong, S. (La Trobe U, Bundoora, Australia) **Cafeteria behavior in the rat after hypothalamic cholinergic and adrenergic stimulation.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 709-711.—After adrenergic stimulation, male Wistar rats ingested significant amounts of mash only; after cholinergic stimulation, Ss ingested significant amounts of water and milk, but water was significantly preferred to milk. Findings support the behavioral specificity of direct chemical stimulation of the brain, and cast serious doubts on the interpretation of milk-ingestion as eating behavior. (22 ref)
4139. Nathan, B. A. & Vogel, J. R. (William H Rorer Inc, Central Nervous System Section, Fort Washington, PA) **Taste aversions induced by d-amphetamine: Dose-response relationship.** *Bulletin of the Psychonomic Society*, 1975(Sep), Vol 6(3), 287-288.—Induced learned taste aversions, as measured by increased time to complete 100 licks of a milk solution 3 days after training, in 30 male Holtzman rats by a single pairing of sweetened condensed milk solution with doses of 1-4 mg/kg dextroamphetamine sulfate. Results support previous findings of aversions induced by 2 mg/kg dextroamphetamine in several other paradigms and suggest that a dose of 1 mg/kg also induces reliable aversions. —Journal abstract.
4140. Numan, Robert; Smith, Nelson & Lal, Harbans. (U Rhode Island) **A versatile procedure for rapid induction of narcotic addiction in the rat utilizing intravenous injections.** *Physiological Psychology*, 1975(Sep), Vol 3(3), 261-262.—Reports that intermittent injections of morphine sulfate in increasing doses produced reliable narcotic dependence in rats within 6 days. Discontinuation of programmed injections induced withdrawal symptoms which were relieved by narcotic administration and which therefore provided motivation to acquire high rates of operant responding for morphine self-administration.
4141. Ostrea, Enrique M.; Chavez, Cleofe J. & Strauss, Milton E. (Wayne State U) **A study of factors that influence the severity of neonatal narcotic withdrawal.** *Addictive Diseases: An International Journal*, 1975, Vol 2(1-2), 187-199.—Studied 198 drug abusing

mothers to investigate possible maternal, neonatal, and/or environmental factors which may affect the severity of neonatal withdrawal. Results of examination of clinic records and of quantitative measurement of drug levels in the urine and serum of the mother and her infant at birth indicate the following: (a) Infants born to drug-addicted mothers were generally of birthweight normal and appropriate for gestational age. The infants born to mothers on a methadone clinic program had a higher birthweight compared to those whose mothers were not on any methadone program. (b) The most severe signs and symptoms of withdrawal were fist sucking, irritability, tremors, sneezing, and high-pitched crying. (c) The severity of neonatal withdrawal correlated significantly with the methadone dose per day of the mother. Other results are also presented.—*Journal summary.*

4142. Ozawa, Hikaru; Miyauchi, Tatsuo & Sugawara, Kazunobu. (Tohoku U. Pharmaceutical Inst, Japan) **Potentiating effect of lithium chloride on aggressive behaviour induced in mice by nialamide plus L-dopa and by clonidine.** *European Journal of Pharmacology*, 1975(Nov), Vol 34(1), 169-179.—Effects of acute administration of lithium chloride (LiCl) on aggressive behavior and alterations in brain norepinephrine (NE), dopamine (DA), and serotonin (5-hydroxytryptamine; 5-HT) contents induced by nialamide plus levodopa and by clonidine were examined in male ddI mice. Effects of LiCl on turnover and metabolism of brain NE were also investigated. LiCl potentiated the aggressiveness induced by both nialamide plus levodopa (40 mg/kg and 100 mg/kg, respectively) and by clonidine (5, 20, and 40 mg/kg). Increase in levels of brain NE, DA, and 5-HT by nialamide plus levodopa was not affected by LiCl. The potentiating effect of LiCl on clonidine aggression was not observed in mice pretreated with disulfiram. Although LiCl did not alter the steady state levels of brain NE, DA and 5-HT, it increased the turnover of NE and decreased the content of endogenous normetanephrine. Results support the assumption that lithium reduces the ability of nerve terminal vesicles to store NE leading to an increased turnover and decreased concentration of NE at receptor sites. (61 ref)—*Journal abstract.*

4143. Pappas, Bruce A. et al. (Carleton U, Ottawa, Canada) **Early behavioral and catecholaminergic effects of 6-hydroxydopamine and guanethidine in the neonatal rat.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 681-685.—Newborn Wistar rats received 7 consecutive daily injections of 6-hydroxydopamine (6-OHDA) or guanethidine. Locomotor activity, measured at 3-day intervals, was differentially affected by these drugs, although neither drug eliminated a characteristic pattern of ontogeny of locomotor activity. 6-OHDA decreased tyrosine hydroxylase activity in cortex and cerebellum, increased it in the brainstem, and had no effect on the hypothalamus. Guanethidine slightly elevated enzyme levels in all 4 brain regions, with the elevation in brainstem significant at 16 days of age. Regional brain changes in enzyme activity after 4 daily 6-OHDA injections beginning at 1, 5, or 9 days of age indicated that toxic effect of 6-OHDA upon catecholaminergic neurons was age dependent. Data are not consistent with a simple interpretation either in terms of

maturational changes in blood brain barrier permeability to 6-OHDA or neuronal uptake of the drug. Further analyses of brainstem areas indicated that the increased brainstem enzyme activity after 6-OHDA was restricted to the pons. (26 ref)—*Journal abstract.*

4145. Pelletier, Georges; Labrie, Fernand; Kastin, Abba J. & Schally, Andrew V. (MRC Group in Molecular Endocrinology, U Laval Medical Ctr, Quebec, Canada) **Radioautographic localization of radioactivity in rat brain after intracarotid injection of ¹²⁵I- α -melanocyte-stimulating hormone.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 671-674.—¹²⁵I- α -melanocyte-stimulating hormone (MSH) was injected into the carotid artery of the male Sprague-Dawley rat, and the radioactivity was localized by radioautography. Radioactivity in the areas surrounding the ventricles and blood vessels after administration of ¹²⁵I- α -MSH but not ¹²⁵I-luteinizing hormone indicated passage of labeled material through the blood brain barrier. A specific concentration of radioactivity was found in the striatum and reticular nucleus of the thalamus. This localization, particularly in the thalamus, could be correlated with the previously reported effects of MSH on the brain of animals and man.—*Journal abstract.*

4146. Pérez-Cruet, Jorge; Nguyen, B. Thoa & Ng, Larry K. (NIMH, Div of Narcotic Addiction & Drug Abuse, Bethesda, MD) **Acute effects of heroin and morphine on newly synthesized serotonin in rat brain.** *Life Sciences*, 1975(Aug), Vol 17(3), 349-362.—Heroin and morphine, in acute ip doses of 2 and 10 mg/kg, respectively, in male Sprague-Dawley rats produced significant increments in the formation of newly formed brain serotonin from tritiated ³H-levotryptophan to ³H-serotonin. Opiate analgesia, Straub tail sign, and catalepsy were observed during the increase in the synthesis of serotonin. The transport of radio-labeled tryptophan into the rat brain was not increased by the acute injection of the opiates, but brain levels of ³H-serotonin and of 5-hydroxyindoleacetic acid were significantly elevated. An increase in the activity of tryptophan hydroxylases was more pronounced in the forebrain than in the brain stem. It is concluded that stimulation of newly synthesized serotonin is probably mediated by an increase in tryptophan hydroxylase activity and not by an increase in the transport of tryptophan into the brain. (59 ref)—*Journal abstract.*

4147. Plonikoff, Nicholas P.; Broese, George R. & Prange, Arthur J. (Abbott Lab. Experimental Therapy Div., N. Chicago, IL) **Thyrotropin releasing hormone (TRH): DOPA potentiation and biogenic amine studies.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 665-670.—Demonstrated in Swiss albino mice that TRH when administered over 5 days remained active in the Everett Dopamine Potentiation Test. No evidence of tolerance was observed. In fact, an accumulative effect of TRH appeared to take place. Ablation of

the adrenals, ovaries, testes, pineal, spleen, parathyroid, 1 kidney, or thymus did not disrupt this behavioral potentiation of dopamine by TRH. TRH potentiated the effects of imipramine. No overt toxicity was observed between TRH and pargyline or between TRH and DOPA. Toxicity was seen only when all 3 agents were used together. TRH was active in young and old Ss and in potentiating the central effects of serotonin. Biogenic amine brain levels were not altered by TRH when administered for 5 days. Alpha-methyl-paratyrosine reduced the activity of TRH in the dopamine potentiation test, suggesting dopaminergic mechanisms are involved by a direct receptor interaction. (23 ref)—*Journal abstract*.

4148. Post, Robert M.; Kopanda, Richard T. & Lee, Alison. (NIMH, Adult Psychiatry Branch, Bethesda, MD) **Progressive behavioral changes during chronic lidocaine administration: Relationship to kindling.** *Life Sciences*, 1975(Sep), Vol 17(6), 943-950.—Chronic, 5 times/wk administration of lidocaine (60 mg/kg, ip) to 21 male Sprague-Dawley rats resulted in the progressive development of abnormal eating behavior and seizures. Ss became omniphagic, eating significantly more feces, straw, and gauze than the 6 controls. Following an average of 15 lidocaine injections unassociated with seizures, Ss began to have major motor convulsions, which then increased in frequency and duration. A pharmacological kindling mechanism is suggested for the progressive effects of lidocaine on behavior and seizures. (30 ref)—*Journal abstract*.

4149. Rigter, H. (Scientific Development Group, Oss, Netherlands) **Plasma corticosterone levels as an index of ACTH₁₋₁₀-induced attenuation of amnesia.** *Behavioral Biology*, 1975(Oct), Vol 15(2), 207-211.—Wistar rats subjected to footshock during a passive avoidance task showed increased plasma corticosterone levels 15 min after a retrieval test. Ss rendered amnesic with carbon dioxide did not show an increase in corticosterone. Administration of ACTH₁₋₁₀ 1 hr prior to retrieval caused an attenuation of amnesia as indicated by a rise in plasma corticosterone levels. (15 ref)

4151. Roberts, D. C.; Zis, A. P. & Fibiger, H. C. (U British Columbia, Div of Neurological Sciences, Vancouver, Canada) **Ascending catecholamine pathways and amphetamine-induced locomotor activity: Importance of dopamine and apparent non-involvement of norepinephrine.** *Brain Research*, 1975, Vol 93(3), 441-454.

Used stereotactically placed intracerebral microinjections of 6-hydroxydopamine (6-OHDA) to produce selective and extensive lesions of either the dopaminergic nigro-neostriatal bundle or the dorsal and ventral noradrenergic projections in male Wistar rats. The extensive damage of the noradrenergic pathways typically obtained after intranigral 6-OHDA injections was completely prevented by pretreatment with desipramine. Extensive depletions (85-95%) of norepinephrine (NE) in the hypothalamus, cerebral cortices, and hippocampus failed to influence either spontaneous or dextroamphetamine-induced locomotor activity. In contrast, selective

depletion (92%) of neostriatal dopamine (DA) after intranigral 6-OHDA injections severely reduced but did not abolish amphetamine-induced hyperkinesia. At the highest dose studied (2.0 mg/kg) these Ss showed an initial increase in activity but, unlike controls, failed to maintain this level. Pimozide (0.5 mg/kg) also severely attenuated but did not abolish amphetamine-induced locomotor activity. Data suggest that ascending DA projections are a critical substrate for amphetamine-induced hyperkinesia and that ascending NE systems do not play a role in this response. (36 ref)—*Journal abstract*.

4152. Rodier, Patricia M.; Webster, William & Langman, Jan. (U Virginia) **Morphological and behavioral consequences of chemically induced lesions of the CNS.** In N. R. Ellis (Ed), *Aberrant development in infancy: Human and animal studies*. Hillsdale, NJ: Lawrence Erlbaum, 1975. viii, 287 p.—Reports studies of mice which used drugs believed to interfere with cell proliferation to eliminate specific cells in the developing CNS. When azacytidine was injected at 3 stages of development, treated mice differed from controls in weight and rate of development; the earlier the treatment, the greater the retardation. Implications for models of congenital brain damage are noted.

4153. Ross, Joseph F.; McDermott, Lois J. & Grossman, S. P. (U Chicago) **Disinhibitory effects of intrahippocampal or intrahypothalamic injections of anticholinergic compounds in the rat.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 631-639.—In 2 experiments the effects of hippocampal or intrahypothalamic injections of anticholinergic compounds on operant responding by a total of 31 male Sprague-Dawley albino rats were observed in a multiple schedule paradigm consisting of reinforced, punished, and nonreinforced components, and on a punished ingestive passive avoidance task. The pattern of results suggests that cholinergic components of the hippocampus and hypothalamus mediate responding suppressed by nonreinforcement but not by punishment. Data are discussed with reference to P. L. Carlton's (1963) proposed central cholinergic inhibitory mechanisms. (51 ref)—*Journal abstract*.

4154. Schechter, Martin D. & Jellinek, Peter. (Eastern Virginia Medical School, Norfolk) **Evidence for a cortical locus for the stimulus effect of nicotine.** *European Journal of Pharmacology*, 1975(Nov), Vol 34(1), 65-73.—Investigated the stimulus properties of nicotine in 144 male hooded rats to determine the time course of the nicotine-produced interoceptive cue and its relationship to specific brain levels of the drug. The behavioral task employed was shock-escape in a T maze. After the injection of 162.5 µg/kg ip of nicotine or saline, entrance into the nicotine-correct arm of the T maze resulted in termination of a 0.6 mA shock. When saline was administered, entrance into the opposite arm was rewarded by termination of shock. A high level of discrimination between nicotine and saline was obtained, and the degree of discrimination decreased as the length of time between nicotine administration and the test of discrimination was increased. This decline in discrimination was closely correlated with the decline in brain levels of nicotine in the cortex, suggesting that the

stimulus effect of nicotine is directly related to the concentration of nicotine in the cortex. (24 ref)—*Journal abstract*.

4155. Segal, David S. (U California, Medical School, San Diego) **Behavioral characterization of d- and l-amphetamine: Neurochemical implications.** *Science*, 1975(Oct), Vol 190(4213), 475-477.—Subcutaneous doses of dextro- and levoamphetamine affected the temporal pattern of male Sprague-Dawley rats' behavior in the following ways: (a) The patterns of activity produced were similar but out of phase; the response to dextroamphetamine had a relatively shorter latency, whereas the effects of levoamphetamine persisted for longer periods of time. (b) Dextroamphetamine was approximately 5 times as potent in its effects on both the total amount of locomotor activity and the duration of stereotypy. It is concluded that both amphetamine-induced locomotion and stereotypy may be mediated by the same neurochemical mechanisms. (15 ref)—*Journal abstract*.

4157. Stern, Pavao & Čatović, Sabria. (U Sarajevo, Yugoslavia) **Brain glycine and aggressive behavior.** *Pharmacology Biochemistry & Behavior*, 1975(Jul-Aug), Vol 3(4), 723-726.—Results show that glycine, nalorphine, and mephenesin successfully suppressed aggressiveness in rats, but findings were inconsistent in mice. Glycine abolished isolation-induced aggressiveness in mice, but not that caused by levodopa or clonidine. It is suggested that central glycine levels might be involved in the development of certain types of aggressive behavior. (15 ref)

4158. Thor, Donald H. (E. R. Johnstone Training & Research Ctr, Bordentown, NJ) **Total suppression of irritable aggression in rats by sensory deprivation.** *Psychological Reports*, 1975(Oct), Vol 37(2), 432-434.—Conducted 2 experiments in which blockade of shock-elicited fighting in 6 pairs of mature male Long-Evans rats was accomplished by combined application of lidocaine HCl to the vibrissal pads and intranasal mucosa. 8 nontreated males emitted vigorous biting attack when paired with 4 anosmic and facially anesthetized males; 4 nontreated females did not engage in comparable aggressive attack upon the same target males.—*Journal abstract*.

4159. Van Netten, Christiaan. (Simon Fraser U, Canada) **The effect of pharmacological agents on Nitella cells.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1266.

4160. Zemp, John W. & Middaugh, Lawrence D. (Medical U South Carolina) **Some effects of prenatal exposure to D-amphetamine sulfate and phenobarbital on developmental neurochemistry and on behavior.** *Addictive Diseases: An International Journal*, 1975, Vol 2(1-2), 307-331.—Conducted studies with C57BL/6J mice to (a) determine whether injecting pregnant mice with dextroamphetamine sulfate would produce changes in the concentrations of catecholamines in the brains and in the activity of Ss' offspring, and (b) examine the effects of prenatal administration of phenobarbital on

nucleic acid and protein levels in the brains and on some long lasting behavioral deficits produced by the prenatal exposure. Results show that prenatal ip injection of dextroamphetamine sulfate produced decreases in the levels of catecholamines in the brain on the day of birth and increased on day 30. Prenatal ip injection of phenobarbital resulted in decreased litter size, increased mortality, and decreased amounts of nucleic acid and protein in the brains of surviving offspring. Behavioral deficits associated with response perseveration could be demonstrated at 60 days in the mice prenatally exposed to this dosage. (52 ref)—*Journal summary*.

COMMUNICATION SYSTEMS

4161. Cater, Douglass & Adler, Richard (Eds). (Aspen Inst Program on Communications & Society, Palo Alto, CA) **Television as a social force: New approaches to TV criticism.** New York, NY: Praeger, 1975. 171 p. Presents papers intended to stimulate fresh examination of TV's impact on society and to persuade leading humanists to think about the medium. An overview of the literature is included, and TV criticism and public health, newspaper and TV news, and American political legitimacy in an era of electronic journalism are discussed. (6 p ref)

4162. Clark, Richard E. (Syracuse U, Area of Instructional Technology) **Constructing a taxonomy of media attributes for research purposes.** *AV Communication Review*, 1975(Sum), Vol 23(2), 197-215. Despite the fact that working with the aptitude-treatment interaction (ATI) research requires that knowledge of the media and aptitudes involved be roughly equivalent, a tabulation of selected research studies shows that one of the problems has been that while aptitudes in a study may have been specified in detail, the media attributes were not, or vice versa. A need is seen for a taxonomy that would make systematic study of media and individual difference variables possible. A number of strategies for constructing a taxonomy that would take into account media, individual differences, and behaviors is suggested. *Journal summary*.

4163. di Vesta, Francis J. (Pennsylvania State U) **Trait-treatment interactions, cognitive processes, and research on communication media.** *AV Communication Review*, 1975(Sum), Vol 23(2), 185-196. A summary of the history of media research suggests the aptitude-treatment interaction (ATI) approach as the logical next step. A proposal to focus on the information processing approach to interaction studies and particularly on the process—the events that occur before, during, and after a learning task—is presented. A number of new and researchable hypotheses and experimental approaches to ATI are discussed. *Journal summary*.

4164. Graham, Jean A. & Argyle, Michael. (Oxford U, England) **A cross-cultural study of the communication of extra-verbal meaning by gestures.** *International Journal of Psychology*, 1975, Vol 10(1), 57-67. Conducted a study with 24 English and 24 Italian male college students. One member of each 4-member same-culture group was randomly assigned to be the encoder, the others to act as decoders. Encoders were asked to

communicate 2-dimensional shapes to decoders, with and without the use of hand gestures, for materials of high and low verbal codability. Decoders drew what they thought the shapes were, and these were rated by English and Italian judges, for similarity to the originals. Higher accuracy scores were obtained by both the English and the Italians, when gestures were allowed, for materials of both high and low codability; but the effect of using gestures was greater for materials of low codability. Improvement in performance when gestures were allowed was greater for materials of low codability. Improvement in performance when gestures were allowed was greater for the Italians than for the English for both levels of codability. An analysis of the recorded verbal utterances has shown that the detriment in communication accuracy with the elimination of gestures cannot be attributed to disruption of speech performance; rather, changes in speech content occur, indicating an increased reliance on verbal means of conveying spatial information. It is concluded, nevertheless, that gestures convey this kind of semantic information more accurately, and evidence is provided for the gestures of the Italians communicating this information more effectively than those of the English. (French summary) (16 ref)—*Journal abstract*.

Language & Speech

4165. Baars, Bernard J.; Motley, Michael T. & MacKay, Donald G. (U California, Los Angeles) **Output editing for lexical status in artificially elicited slips of the tongue.** *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 382-391.—B. J. Baars and M. T. Motley (1974) found that spoonerisms (e.g., *bad goof-gad boof*) can be elicited by having Ss articulate a target (*bad goof*) preceded by bias items which contain at least the initial phoneme (/g/) of the desired error outcome. Based on the fact that 2 very similar targets such as *darn bore* and *dart board* will often have very different outcomes (e.g., the error outcome *barn door* is meaningful while *bart doard* is not), it appears that any systematic difference in the rate of errors between these types of targets must be attributable to processes which take place after recoding of the target into its corresponding slip. Therefore, 2 experiments were conducted with a total of 52 undergraduates to evaluate directly the effects of editing processes which apply only to the error outcome, and not to the target word pair. Results show that for lexical (L) targets, L outcomes are significantly more frequent than nonsense (N) outcomes. For N targets, the same generalization was found, but only in a context that contains lexical filler items. There was no difference in the overall spoonerism rate on the basis of the lexical status of the error outcome unless the context clearly contains other lexical items. In such a context, nonlexical outcomes appear to be suppressed.—*Journal abstract*.

4166. Blunt, Peter. (U Nairobi, Kenya) **"Scientific psychology" and the "American style."** *International Journal of Psychology*, 1975, Vol 10(1), 85-88. Argues that D. L. Krantz's (1971) use of the word "scientific" is "murky" and that there is an illogicality in his description of an Americanized European psychological community. Incomprehensibility resulting from poor English

usage is also discussed. The present author indicts portions of Frantz's article as examples.

4167. Cinque, Joseph A. (Fordham U) **Imitation, comprehension, and production of morphological language constructs within subjects in their native and second language.** *Dissertation Abstracts International*, 1973(Nov), Vol 34(5-A), 2381.

4168. Johnson, Michael G. (U Tennessee) **Some psychological implications of language flexibility.** *Behaviorism*, 1975(Spring), Vol 3(1), 87-95.—Criticizes formulations of meaning which emphasize static structures carried around in the head and suggests an alternative approach emphasizing process. Aspects of language which raise questions concerning the adequacy of a structural formulation are (a) the importance of context as a determinant of meaning, (b) evidence of historical and ontogenetic meaning change, and (c) language flexibility in the form of figurative and metaphoric language use. The suggested alternative approach considers meaning as an active process involving the creation of a cognitive schema in a specific situation.—S. M. Levin.

4169. Kleiman, Glenn M. (Stanford U) **Speech recoding in reading.** *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 323-339.—Conducted 3 experiments with a total of 32 undergraduates to study whether recoding to speech during reading occurs before lexical access, after lexical access, or not at all. Results support a model of reading sentences in which speech recoding occurs after lexical access and facilitates the temporary storage of words necessary for sentence comprehension. (32 ref)

4170. Koutstaal, C. W. & Smith, O. W. (Bowling Green State U) **Phonological extrapolations about effort after ratings of phonemic CCVCs by native speakers of Portuguese.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 111-114.—Effort ratings of phonemes in the order of consonant-consonant-vowel-consonant (CCVC) that had been scaled for language distance from English by J. H. Greenberg and J. J. Jenkins (1964) were obtained from 28 native speakers of Portuguese, a language with few if any words in the order of CCVC. Mean scale values correlated 0.85 with S-scale values of the CCVCs. Mean scale values for effort ratings by native speakers of American English, Dutch, and Portuguese were plotted against C. W. Koutstaal et al (1972) categories for the CCVCs. The curves were judged to be comparable. Effort of pronunciation is discussed as a determinant of phonological patterns of words of any language.—*Journal abstract*.

4171. Laosa, Luis M. (U California, Graduate School of Education, Los Angeles) **Bilingualism in three United States Hispanic groups: Contextual use of language by children and adults in their families.** *Journal of Educational Psychology*, 1975(Oct), Vol 67(5), 617-627.—Studied the use of language pattern in different social contexts among Central Texas Mexican-American, Miami Cuban-American, and New York Puerto Rican children and adults in their families through structured interviews, by trained indigenous interviewers, for a total of 295 families. Children were 1st, 2nd, and 3rd graders, approximately equally divided by sex. Results indicate that even within subcultural communities there was

significant variability in the language patterns used in various social contexts. The Central Texas Mexican-Americans evidenced the greatest degree of displacement of mother tongue. There were significant child-adult differences in language use among the Mexican-American and Cuban-American families. Results are discussed in light of factors that may affect language maintenance. (27 ref)—*Journal abstract.*

4172. Lieberman, Philip. *Intonation, perception, and language.* Cambridge, MA: M.I.T. Press, Mono No 38, 1975. xiii, 210 p.—Presents a linguistic analysis of various aspects of the intonation of American English, and examines the problem of intonation in all languages. 2 features that may underlie the intonation of American English are discussed—the breath-group and prominence. (9 p ref)

Literature & Art

4177. Edel, Leon E. (U Hawaii) *The madness of art.* *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1005-1012.—Notes that the madness of art, the need to transform and metamorphose personal experience by means of prose, poetry, or other artistic expression, is illustrated in the lives and works of many great writers. It is posited that the most enduring works may be those of artists who have lived through their sadness to experience and control their rage against aging.

4178. Graeven, David B. & Morris, Susan J. (California State U, Hayward) *College humor in 1930 and 1972: An investigation using the humor diary.* *Sociology & Social Research*, 1975(Jul), Vol 59(4), 406-410. Uu-

lized the humor diaries of 42 college students to compare student humor in 1930 and 1972; data for 1930 are from a study by Kambourpoulou. Humorous incidents were classified as: mass media produced; emerging spontaneously in the situation; response to memorized jokes; and response to the telling or recall of a previous event. The distribution of humorous incidents in the 2 time periods were highly similar. Most frequent were incidents involving spontaneous interpersonal humor. 2 types of incidents—telling about previous events and spontaneous interpersonal humor—were noted as the least studied form of humor.—R. V. Heckel.

4179. Hankoff, L. D. (New York Medical Coll, NY) *The hero as madman.* *Journal of the History of the Behavioral Sciences*, 1975(Oct), Vol 11(4), 315-333.—Accounts of 5 individuals in ancient history who feigned mental illness (Odysseus, David, Solon, Kaikhosrau, and Brutus) show similar patterns. Each one pretended to be mad when confronted with a life-threatening situation, and each one later had a brilliant career. The pretense may have functioned as a self-renewal and symbol of rebirth.—C. M. Franks.

4180. Nass, Martin L. *On hearing and inspiration in the composition of music.* *Psychoanalytic Quarterly*, 1975(Jul), Vol 44(3), 431-449. Notes that abundant biographic and autobiographic data from the lives of classical and modern composers lead to certain psychoanalytic inferences regarding hearing and inspiration in musical creativity. The composer (and gifted performer) has an increased auditory acuity, a hypersensitivity to sound and rhythm that appears to originate in the infant mother sensorimotor relationship. The preference for sound during childhood establishes hearing as the chief sensory modality in organizing the composer's cognitive functions, his object relations, and his perception of the world. Some of the many determinants of the composer's auditory style and hypercathexis of hearing are discussed. Other aspects of the composer as a creative artist are considered psychoanalytically. (52 ref) —J. Z. Elias.

4181. Nickl, R. M. & Moss, Virginia. (U New Brunswick, Fredericton, Canada) *Preference for non-representational art as a function of various measures of complexity.* *Canadian Journal of Psychology*, 1975(Sep), Vol 29(3), 237-249. Conducted 2 experiments with a total of 89 undergraduates in which preference for nonrepresentational works of art (line number of 0.5-sec exposures and ratings of interest/pleasantness) was found to be mainly linearly related to complexity. The latter was defined in terms of spatial judgments and 2 measures related to information theory. The relationship between these variables and an additional dependent response measure, picture naming completion time led to the conjecture that preference is governed by (a) the number of elements in a picture and their degree of irregularity in arrangement, and (b) the cognitive labels generated by the visual elements also expressed in terms of information theory. (French summary) (22 ref) *Journal abstract.*

4199. Horn, Paul W. (Indiana State U) **Pursuit rotor speed, sex differences, and reminiscence in young children.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 81-85.—Data collected in a study of pursuit rotor abilities of 39 1st graders reveal that speed of response is a major dimension of performance in young children. Evidence for the early appearance of reminiscence was found, including data showing a significantly greater amount of reminiscence in males than in females. Moderate correlations between rotation speeds reflected the specificity of performance requirements at each speed. Data are interpreted in terms of the rapid rate of

perceptual motor skill development at this age and suggest the need for more intense study of specific subskills needed for task success.—*Journal abstract.*

4200. **Kerr, Robert.** (McMaster U) **Movement control and maturation in elementary-grade children.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 151-154.—Recorded serial tapping by 5-, 7-, and 9-yr old boys and girls, as measured by Fitts' Law. 60 Ss performed a reciprocal tapping task and were assessed developmentally via hand-wrist X-rays. No significant relationship was found between the fine motor task and skeletal age. Results of the motor task suggest an improvement in movement time, with age, due to an ability to plan subsequent movements rather than simply an increase in speed of arm movements.—*Journal abstract.*

4201. **Kligman, David; Smyrl, Ron & Ende, Robert N.** **A "nonintrusive" longitudinal study of infant sleep.** *Psychosomatic Medicine*, 1975(Sep-Oct), Vol 37(5), 448-453.—Filmed 6 normal, full-term infants in their homes at weekly intervals during regular morning nap times, using a special system that could be activated by the mother. Filming began at about 7 wks of age and continued until 3 successive NREM sleep patterns could be observed and rated by independent judges. All Ss demonstrated changeovers from REM sleep onset to NREM sleep and the age range for this phenomenon was 8-22 wks, but there was no indication of a central tendency for age of changeover. Observations by mothers regarding the 24-hr period prior to the filmed naps yielded no relationships sleep-wakefulness patterns.—*L.Gorsey.*

4202. **Kopp, Claire B.** (U California, Los Angeles) **Development of fine motor behaviors: Issues and research.** In N. R. Ellis (Ed), *Aberrant development in infancy. Human and animal studies.* Hillsdale, NJ: Lawrence Erlbaum, 1975, viii, 287 p.—Discusses theoretical and methodological issues in research on motor behavior and cognition and individual differences in manipulative abilities, and describes recent studies on fine motor behaviors of 8-mo-old infants. It is suggested that fine motor behavior is not a unitary system and should be studied in conjunction with other sensory systems and other dimensions of behavior in the developing infant (i.e., attention and motivation). 4203. **Kramer, Marlene; Chamorro, Iltia; Green, Dora & Knudtson, Frances.** (U California, San Francisco) **Extra tactile stimulation of the premature infant.** *Nursing Research*, 1975(Sep-Oct), Vol 24(5), 324-334.

Investigated whether extra tactile stimulation would result in more rapid physical and social development and a greater degree of social development of the premature infant. 48 min of extra tactile stimulation, (a gentle, nonrhythmic stroking of the greatest possible area of skin surface of the infant's body by the nurse's hand) was given to 8 premature infants daily for a minimum of 2 wks while they were confined to an incubator; 6 premature infants were controls. Regain of birth weight was used to assess physical development. Scores on the applicable portions of the Gesell Development Schedule and Bayley Scales of Infant Development and plasma cortisol levels were used to measure rate and degree of social development. There was a significant difference between experimental and control Ss in rate (but not

degree) of social development. Plasma cortisol levels as an indication of the infant's adrenocortical development as evidenced by his ability to respond to stressful situations, and hence indirectly his social development, revealed no significant difference between the 2 groups. 4204. **Labourie, Erich W.** (U Wisconsin, Madison) **Developmental causal structures of organism-environment interactions.** *Human Development*, 1974, Vol 17(6), 444-452.—Argues that the investigation of organism-environment interaction in a developmental framework has been hampered by a lack of adequate analytical methods. Since the application of multivariate structural analyses has been quite promising for the study of behavioral systems, an extension of this approach to the description and explication of organism-environment interactions on a macroscopic level may be considered as an appropriate next step. Based on characteristics of the assumed feedback mechanisms between the behavioral and environmental systems, it is possible to analyze longitudinally ordered sequences in terms of recursive vs nonrecursive and distal vs proximal relationships both within and between domains. Hillsdale, NJ: Lawrence Erlbaum, 1975. viii, 287 p.—Describes a series of studies with normal human infants which attempted to (a) identify characteristics of behavioral states in newborn infants, (b) assess changes that occur in state organization within the first weeks of life, and (c) develop measures of behavioral states that characterize individual infants during these early weeks.

4214. **Todor, John I.** (U California, Berkeley) **Age differences in integration of components of a motor task.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 211-215.—3 groups of 50 boys performed 30 consecutive trials to study effects of practice on the ability of 6-, 11-, and 18-yr-old Ss to integrate the components of the Rho task. Results show that (a) with practice all age groups improved in total movement time; (b) 11-yr-olds attained the 18-yr-olds' level of performance in both components, initial differences existing only in the linear component; (c) relative to the 18-yr-olds, the 6-yr-olds achieved proportionally less improvement in the linear component; and (d) unlike 11- and 18-yr-olds, the 6-yr-olds evidenced increasing specificity of task components across trials. Unlike the 2 older age groups, the 6-yr-olds were unable to achieve a high degree of integration of task components. Findings are discussed in light of J. Pascual-Leone's (see PA, Vol 45:7908) neo-Piagetian model of learning and development.—*Journal abstract*.

4224. **Blue, C. Milton & Vergason, Glenn A.** (U Georgia) **Auditory discrimination in conditions of noise and quiet by Black and White disadvantaged children.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 35-40.—Investigated the auditory discrimination of 1st and 3rd graders of low socioeconomic status. 17 Black and 17 White Ss were randomly selected from the 2 grades. The condition for listening was varied (i.e., discrimination in

condition of quiet and discrimination in condition of noise) through the use of the Goldman-Fristoe-Woodcock Test of Auditory Discrimination. White 3rd graders were superior performers. The expectation, from the literature, that the auditory discrimination of children from low socioeconomic levels would be depressed in conditions of noise was not supported. In fact, Black Ss performed in an inferior manner in conditions of quiet. —*Journal abstract.*

4225. Botwinick, Jack; West, Robin & Storandt, Martha. (Washington U, St Louis) **Qualitative vocabulary test responses and age.** *Journal of Gerontology*, 1975 (Sep), Vol 30(5), 574-577.—Vocabulary test responses as traditionally scored were compared to these same responses when scored for finer nuances of understanding, as determined by the criterion of superior synonyms. It was hypothesized that the latter would be more related to age in a deficit pattern than the former. Ss were 107 Ss, 6-20 in each age decade, 20's-70's. Mean levels of education of the 4 youngest decades were 14-15 yrs, and in the 2 oldest decades, levels were 11 yrs. Results partly support the hypothesis. In the context of the positive results, it is not clear whether the aged cannot, or simple do not, give synonym responses as readily as the young. It may be more of a cohort preference not to, rather than an age limitation of intellectual ability. (19 ref)—*Journal abstract.*

4228. Brainerd, Charles J. & Fraser, Michele. (U Alberta, Edmonton, Canada) **A further test of the ordinal theory of number development.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 21-33.—Examined 2 questions about C. J. Brainerd's (see PA, Vols 50:10969 and 51:10853) findings that the natural number

concept derives from a prior understanding of ordination rather than from an understanding of cardinality: (a) whether the findings hold when Piaget's criterion of natural number competence (i.e., number conservation) is substituted for a mathematical criterion (i.e., addition and subtraction of integers); and (b) what processes account for the later emergence of cardinality relative to ordination and natural number. In a study with 100 kindergartners and 1st graders, it was found that the sequence of emergence of number concepts was ordination \leftarrow natural number \leftarrow cardinality, when conservation was the natural number criterion. It was also observed that approximately 50% of the Ss did not possess a concept which was both logically and empirically necessary for cardinality (i.e., the concept of number-as-class). The concept of number-as-class, which was measured by a card sorting task, was also found to emerge after ordination and concurrently with natural number. (15 ref)—*Journal abstract.*

4230. Casey, M. Beth. (Boston U) **The effect of training procedures on the overlearning reversal effect in young children.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 1-12. Studied the performance of 80 preschoolers on a reversal problem as a function of amount of training and type of training procedure used during acquisition and reversal. In the extinction phase of reversal learning, Ss given a correction procedure during the reversal problem made fewer perseverative errors than Ss given noncorrection. In the reversal mudplateau phase of reversal learning, overtraining facilitated reversal learning for Ss receiving noncorrection during the acquisition problem but not for Ss receiving correction. A shift in training procedure between acquisition and reversal increased the number of Ss who reached criterion immediately after perseveration. Since these results are difficult to explain in terms of traditional learning theories, an alternative response-switching strategy explanation is proposed. (23 ref) —*Journal abstract.*

4231. Cecchini, Marco & Pizzamiglio, Luigi. (CNR, Istituto de Psicologia, Roma, Italy) **Effects of field-dependency, social class and sex of children between ages 5 and 10.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 155-164. Studied development of field-independency as a function of age (5-10 yrs), social class, and sex, utilizing 2 groups of 96 Ss each of high and low social class. On the Children's Embedded Figures Test a critical developmental period appeared between ages 5 and 8 yrs for all Ss; on the Draw-a-Person test such a period appeared between ages 5 and 6 for high social class and between ages 6 and 8 for lower social class.

scores on both tests were statistically significant as a function of social class at every age beginning at age 6. Sex did not seem to play a significant role. 3 main masking factors were singled out on the Children's Embedded-Figures Test. Their differential effects on scores of Ss in the 2 classes are examined. 4236. Cromer, Richard F. **An experimental investigation of a putative linguistic universal: Marking and the indirect object.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 73-80.—Two experiments, using a total of 77 7-10 yr olds, investigated how children acquire knowledge of the direct and the indirect object in terms of linguistic marking. This was done in order to test experimentally the psychological validity of a putative linguistic universal which holds that children should expect a marked linguistic form to be the indirect object. An artificial language which marked these forms was used. This language eliminated the preposition "to" as well as word order as cues in learning the experimental forms. One group heard the indirect object as the marked form in the artificial language, and another group heard the direct object as the marked form. The

linguistic theory would predict that the former group would be superior in learning the artificial language. However, using error scores, no difference was found artificial the 2 groups. This negative result was also independent of whether an S had achieved mastery of the normal English constructions involving direct and indirect object relationships. Reasons for the failure to find any evidence for this universal are discussed.—*Journal abstract.*

4237. Cronin, James et al. (Brandeis U) **Race, class, and intelligence: A critical look at the IQ controversy.** *International Journal of Mental Health*, 1974-75(Win), Vol 3(4), 46-132.—Challenges A. R. Jensen's propositions about the genetic inferiority of Blacks, separately and as a whole. Detailed examination of the IQ test shows that it does not in fact measure intelligence, but social background and experience; hence the correlation of IQ scores with success is baseless. Jensen's claim that IQ is heritable is considered to be based on assumptions that cannot be accepted and on data that are methodologically flawed or even fabricated. His 4 arguments for Black inferiority (based on IQ heritability, on alleged failures of the environmentalist theory, on physical difference between double-bind and on 19th century anthropological stereotypes) are analyzed and found deficient. Despite the weakness of Jensen's position, it is considered dangerous. The implications of the controversy, for id-ego and for education, are discussed. (6½ p ref) —A. H. Alawi.

4244. Gholson, Barry & Danziger, Sheldon. (Memphis State U) Effects of two levels of stimulus complexity upon hypothesis sampling systems among second and sixth grade children. *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 105-118.—Groups of 2nd and 6th graders, totaling 60 Ss, each solved a series of discrimination-learning problems involving 4 and 8 dimensions that contained blank-trial probes for the S's hypothesis (*H*). There were significant effects of grade level on 3 dependent measures (learning, generating consistent *H* patterns, and sampling locally consistent *H*s). Main effects of stimulus complexity were significant on 5 measures (the 3 above, rejecting disconfirmed *H*s, and maintaining confirmed *H*s). There were no interactions involving any of these measures. The hypothesis sampling system (*Sy*) observed in each problem was also determined. Among 6th graders this measure was unaffected by stimulus complexity level. 2nd graders generated logically structured *Sy*s in 65% of 4-dimensional, but only 30% of 8-dimensional, problems. They generated stereotyped behaviors or unsystematic sequences of *H*s in 70% of 8-dimensional, but only about 35% of 4-dimensional, problems. Detailed analyses revealed that among 2nd graders good information processors (in terms of 4 component processes above) usually imposed a logical structure on 4-dimensional, but generated unsystematic sequences of *H*s in many of 8-dimensional, problems. Poor processors generated stereotyped behaviors in both 4- and 8-dimensional problems. (26 ref)—*Journal abstract*.

4245. Goldstein, Alvin G. (U Missouri, Columbia) Recognition of inverted photographs of faces by children and adults. *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 109-123.—Presented inverted black-white photographs of the faces of highly familiar peers (e.g., classmates and fraternity brothers) to 350 male and female 3-20 yr old Ss. In an untimed test session, S tried to identify the person in the inverted photograph. Success in this task was positively correlated with age up to approximately 14 yrs, but performance deteriorated after this age; college and preschool Ss' performances were approximately equal. This finding contrasts with the current view that the effects of disorientation on perception becomes less potent with age. A cognitive explanation is offered for the early rise in the performance curve, and the subsequent reduction in level of performance is attributed to rigidity of the perceptual mechanism as a function of overlearning of a mono-oriented configuration. (Wisconsin Research & Development Ctr for Cognitive Learning, Madison) The effect of children's spontaneous cognitive sets on discrimination learning. *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 59-65.—2 experiments, with a total of 184 kindergartners-6th graders, investigated the role of children's spontaneous cognitive sets in pictorial discrimination learning. Lists were constructed to highlight either perceptual or conceptual similarities among the stimuli. In each experiment, Age \times Treatment interpretations revealed that in comparison to the behavior of older children, that of younger children was governed more by the perceptible than by the conceptual attributes of stimuli—data in complete accord with J. S. Bruner's (1964, 1966) view of cognitive development.—*Journal abstract*.

4253. Kail, Michèle. (CNRS, U Paris V, Lab de Psychologie expérimentale et comparée, France) [Genetic study of the reproduction of relatively complex sentences: I. Immediate reproduction.] (Fren) *Année Psychologique*, 1975, Vol 75(1), 109-126.—Studied the immediate reproduction of relatively complex sentences by 80 children 5-9 yrs old. Results show that difficulties arose (a) when the main clause was interrupted by the subordinate clause, (b) when there was a noncorrespondence of superficial and underlying order in the relative clause (what that who), and (c) when the regular subject verb-object order was disrupted by such dependent clauses. The effect of these disruptions was greatest with Ss 6.7 yrs old. The factor of reversibility played no role. Children seemingly follow strategies of perception and/or reproduction which lead them to avoid interruption and reordering of linguistic units. (16 ref)—G. Rubin-Rabson.

4257. Kuczaj, Stan A. (U Minnesota, Inst of Child Development) **On the acquisition of a semantic system.** *Journal of Verbal Learning & Verbal Behavior*, 1975(Aug), Vol 14(4), 340-358.—Conducted 2 experiments with a total of 72 preschool children to study the acquisition of the meaning of *always* and *never*, and *always*, *never*, *usually*, *seldom*, and *sometimes*, respectively. Results demonstrate that the acquisition sequence in which the meaning of related words are acquired may vary from child to child in the beginning of the acquisition process, but becomes consistent in the later parts of acquisition. This type of pattern reflects the importance of the amount and type of linguistic experience for the initial attachment of meaning to words and the later importance of general cognitive and semantic factors which are not easily influenced by varying linguistic experiences. (33 ref)—*Journal abstract*.
4258. Langer, Jonas. (U California, Berkeley) **Interactional aspects of cognitive organization.** *International Journal of Cognitive Psychology*, 1974-1975, Vol 3(1), 9-28.—Presents propositions regarding a comprehensive structural developmental theory of cognitive change. The analytic focus is on (a) the organization of the S's assimilatory operations and accommodatory figurations; (b) the intrinsic coordinations between the theoretical and empirical cognitions constructed, respectively, by these 2 kinds of functional structures; and (c) the cognitive developmental changes produced by intrinsic coordinations. Derivative empirical hypotheses also are considered. (French summary) (52 ref)—*Journal abstract*.
4259. Lemlich, Robert. (U Cincinnati) **Subjective acceleration of time with aging.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 235-238.—Presents a quantitative theoretical model for the subjective acceleration of time with aging. It is based on a new hypothesis, namely, that the subjective duration of an interval of real time decreases in mathematical proportion to total subjective time (rather than total real time). This gives a differential equation, the variables of which are separated and integrated to yield the result that the subjective duration of an interval of real time varies inversely with the square root of the total real time (age). This result was tested by polling a total of 52 college students and 28-57 yr olds as to their recollections regarding the relative apparent rate of the passage of time at various ages. Generally good agreement was obtained between the results of the poll and the results predicted by the theory.—*Journal abstract*.

(U Alberta, Edmonton, Canada) **The development of word meaning discrimination in children.** *Alberta Journal of Educational Research*, 1975(Sep), Vol 21(3), 154-167. Reports results of an investigation which indicate that 13-16 yr olds are capable of discriminating among various kinds of word meaning. Use of the findings for achievement test construction is discussed. (26 ref)
4263. Maxwell, Joseph W.; Croake, James W. & Biddle, Anne P. (Virginia Polytechnic Inst & State U) **Sex differences in the comprehension of spatial orientation.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 127-131.—Examined the effects of instruction upon acquisition of Piaget's concept of horizontality, and determined sex differences related to this acquisition. It was hypothesized that there would be no significant differences (a) in performance on perception and prediction tasks, (b) by sex in the ability to comprehend horizontality, (c) by sex in the stage of development after instruction, and (d) by sex after instruction on the number of correct responses on horizontal tasks. Subjects were 18 male and 17 female students aged 8 yrs to 9 yrs 11 mo. Test instruments were a cylindrical bottle half-filled with colored water and 8 pictures of bottles positioned at angles from 0 to 315° at increments of 45°. Chi square tests indicated that males performed significantly better than females on perception and prediction and that instruction significantly improved male performance on prediction and female performance on prediction and perception. It is concluded that females, if given instruction, could more closely approximate the performance of males on the horizontal water level task.—*Journal abstract*.
4264. McDonnell, Paul M. (U New Brunswick, Fredericton, Canada) **The development of visually guided reaching.** *Perception & Psychophysics*, 1975(Sep), Vol 18(3), 181-185.—Measured the accuracy of reaching in infants wearing 30-diopter prisms, using 22 4-10 mo old infants as Ss. Although accuracy was barely affected, the reach trajectories indicated that Ss switched from a miss path to a hit path in midcourse. There was some evidence to support the view that visually directed reaching was operative in the youngest Ss and that it improved with age.—*Journal abstract*.

4266. Mori, Hideo. (Yamanashi U, Kofu City, Japan) **[An experiment of letter segmentation of cursive scripts by digital computer.]** (*Jpn Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 83-90.—Investigated the validity of the Gestalt psychologists' assumption of the dual process in pattern recognition (i.e., articulation and identification, and the temporal precedence of the former). To test the possibility of letter segmentation without the identification process, kindergartners who had never learned the alphabet were given a segmentation test. It was found that they could partition script into letters almost as well as adults except those scripts containing "m" or "w." A segmentation model based on the 4 factors selected from the Gestalt factors was formulated and was simulated by a digital computer. The model could partition correctly 95% of script and missed the segmentation of the same kind of script that children missed.—*English abstract*.

4267. Murray, Frank B. & Johnson, Paul E. (U Delaware, Coll of Education) **Relevant and some irrelevant factors in the child's concept of weight.** *Journal of Educational Psychology*, 1975(Oct), Vol 67(5), 705-711.—In Newtonian mechanics weight = f (mass of object, mass of earth, inverse of the square of the distance between their centers). On the basis of 120 2nd graders' responses to questions about the change in weight of a clay ball, it is concluded that for these young children weight = f (mass, shape, continuity, context, and temperature of the object) and is not a function of the object's horizontal or vertical position. A general model for research in the concept of weight and other curriculum concepts is presented.—*Journal abstract*.

4270. Papalia, Diane E. & Bielby, Denise D. (U Wisconsin, School of Family Resources & Consumer Sciences, Madison) **Cognitive functioning in middle and old age adults: A review of research based on Piaget's theory.** *Human Development*, 1974, Vol 17(6), 424-443.—Surveys the literature on Piagetian cognitive functioning (i.e., logical operations, animism, moral development, and egocentrism), noting wide individual differences in adult cognitive performance with continued cognitive development for at least some middle-age Ss on certain cognitive tasks. Generally, lower levels of cognitive functioning were found for elderly Ss as compared to adult groups. Several possible interpretations of these age differences are offered; neural degeneration, isolation, terminal drop, and methodological insufficiencies. The effects of certain demographic variables (e.g., educational level, sex, race, living condition of respondent, and presence or absence of diagnosed chronic organic brain syndrome) on performance are reviewed, and inconsistent results are noted. More precise investigations of the factors influencing cognitive performance in adulthood and aging are recommended. (3 p ref)—*Journal abstract*.
4271. Peebles, David R. & Teller, Davida Y. (U Washington, Seattle) **Color vision and brightness discrimination in two-month-old human infants.** *Science*, 1975(Sep), Vol 189(4208), 1102-1103.—In a study with 2 2-mo-old female infants, a red or white bar, embedded in a white screen, was systematically varied in intensity. Ss consistently located and stared at the white bar unless it closely matched the screen in intensity. They also stared at all intensities of the red bar, presumptively including the red white brightness match. It is concluded that all of the neural elements necessary for at least dichromatic color vision, and for remarkably sensitive brightness discrimination, are present in 2-mo-old human infants, and conversely, that any elements of the system which are not yet present are not necessary for these visual functions.—*Journal abstract*.

4274. Povey, Robert & Hill, Eric. (Christ Church Coll, Canterbury, England) **Can pre-school children form concepts?** *Educational Research*, 1975(Jun), Vol 17(3), 180-192.—Administered tests relating to the acquisition of both specific and generic concepts to 56 2.4-4.10 yr olds. Tests of concept acquisition (HAPCAT) were devised, and 29 of the Ss were also given Piagetian "questions" concerning class inclusion. Results conflict with the Piagetian view that preschool children cannot form generic concepts. Most Ss identified HAPCAT specific concepts, and half of the Ss responded appropriately to HAPCAT generic concept items. A statistically significant relationship was found between correct answers to HAPCAT items and Ss' ages and ability level. The Piagetian test questions showed no discriminatory power in these respects. It is argued that the latter do not represent a sensitive or meaningful measure of concept acquisition at this age level. HAPCAT items, however, present preschoolers with intelligible tasks which allow them to demonstrate understanding of generic concepts involving class inclusion.—*Journal abstract*.

4281. Simon, Seymour; Ditricks, Raymond & Speckhart, Lowell. (Northern Illinois U) **Studies in observational paired-associate learning: Informational, social, and individual difference variables.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 81-104.—4 experiments, employing a total of 444 3rd-6th graders, examined the relative importance of informational (proportion of correct responses and kinds of errors emitted by a model), social (model competency, sex of model, video vs audio taped model), and individual difference (sex of S, grade) variables in observational paired associate learning. In Exps I-III, vicarious Ss received cycles of study-model-test trials, while direct Ss were given the same sequences with intervening test or stimulus familiarization trials. In Exp IV, vicarious Ss received cycles of study-test model-test trials, while direct Ss received the cycles with a test trial replacing the model trial. No confirmation was provided on test and model trials. Whereas the effects attributable to social and individual difference variables were generally negligible, mere accuracy of the model's responses repeatedly covaried with performance on the last test trial of each cycle. Conditional analyses established that (a) vicarious facilitation was comparable across cycles and localized in items responded to incorrectly on immediately preceding test trials, and (b) observers learned fewer incorrect than correct model responses. Vicarious groups performed at reliably higher levels than direct Ss on model correct but not incorrect items. Results strongly suggest a close correspondence between direct and vicarious verbal learning principles and mechanisms. (26 ref)—*Journal abstract*.

4283. Strutt, George F.; Anderson, Daniel R. & Well, Arnold D. (U Massachusetts, Amherst) **A developmental study of the effects of irrelevant information of speeded classification.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 127-135.—Examined how well Ss were able to ignore the presence of irrelevant stimulus information as a function of age. A total of 72 Ss—children aged 6, 9, and 12 yrs, as well as 19-yr-olds—sorted cards with 1 binary dimension relevant, and zero, 1, or 2 dimensions irrelevant. Speed of classification was measured. Significant effects of age, sex, number of irrelevant dimensions, and relevant dimension on speed of classification were obtained, as well as a number of interactions of these variables. The most important finding was that the presence of irrelevant information interfered with the performance of the task by child Ss and that the magnitude of the interference declined with age. Results are interpreted as implying that developmental trends in attention may be most clearly demonstrated in tasks which require speeded processing of stimuli. The ease of administration of the speeded classification task, coupled with the clear developmental trends obtained, recommend this paradigm as a useful one with which to study the development of selective attention. (19 ref)—*Journal abstract*.
4284. Surwillo, Walter W. (U Louisville, Medical School) **The electroencephalogram in the prediction of human reaction time during growth and development.** *Biological Psychology*, 1975(Sep), Vol 3(2) 79-90.—Investigated characteristics of the distributions of EEG half waves recorded in 41 5-17 yr old normal males during performance of a simple auditory reaction time (RT) task. The durations of a sample of 760 EEG half waves in each of the Ss were measured and distributed into an interval histogram, and the 1st 4 central moments of the 41 distributions were computed. All 4 of the moments—which measure the central tendency, dispersion, skewness, and kurtosis of the distributions—proved to be significantly correlated with RT. The predictive capability of a multiple regression equation based on dispersion, skewness, and kurtosis was tested in an independent group of 42 Ss also aged 5-17 yrs. EEGs and RTs were recorded, and this group was treated in exactly the same way as the other. The correlation between these Ss' average RTs and their RTs as estimated from the other group's regression equation was 0.53. Findings suggest that knowing the degree of dispersion, skewness, and kurtosis of children's EEG distributions reduces from chance by about 28% of the error of predicting their RTs. (16 ref)—*Journal abstract*.
4285. Tighe, Thomas J.; Tighe, Louise S. & Schechter, Jay. (Dartmouth Coll) **Memory for instances and categories in children and adults.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 22-37.—Trained 32 college students and 32 7-yr-olds in sorting 16 words into 2 conceptual categories. Training consisted of either 3 list presentations (Exp I) or training to solution (Exp II). Then either immediately or after a 3 to 4 wk delay Ss received a recognition test which assessed memory for the instance vs categorical properties of the task stimuli by embedding words from the original list and from the list categories with confusion items from either the same or different categories as those on the original list. The data indicate that learning and memory were controlled primarily by categorical properties of the task items in adults and by specific instance properties in children. However, there was evidence that children had learned the categorical attributes of the task and may have differed from adults chiefly in their failure to utilize these attributes to assist learning and memory performance. Age differences in learning and memory were independent of the degree of initial training.—*Journal abstract*.

4291. **Winer, Gerald A.** (Ohio State U) **Children's preference for body or external object on a task requiring transposition and discrimination of right-left relations.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 291-298.—Tested 57 1st graders on trials requiring the discrimination and transposition of right-left relations, with stimuli similar to (dolls) or different from (toy planes) the body. On an initial series of training and practice trials Ss were allowed to respond to body and external objects as referents providing right-left cues. A later series of test trials was then used to determine the referent the S actually preferred. Results of the test trials indicated that 24 Ss tested with the dolls preferred the body as referent, while 24 Ss tested with planes preferred the external referent. Results are interpreted as suggesting 2 alternative systems through which children develop an understanding of right-left relations and possibly other concepts.—*Journal abstract*.

4292. **Wise, Larry A.; Sutton, James A. & Gibbons, Paul D.** (Texas Wesleyan Coll) **Decrement in Stroop interference time with age.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 149-150.—Compared interference time on the Stroop task for 20 college and 20 elementary school Ss. A decrement in interference time between groups was found and is consistent with E. Gibson's (1969) perceptual learning theory.—*Journal abstract*.

4293. **Wohlwill, Joachim F.** (Pennsylvania State U) **Children's voluntary exploration and preference for tactually presented nonsense shapes differing in complexity.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 159-167.—Conducted a study which represents an extension of research on children's response to nonsense shapes varying in complexity to the tactual modality. Wooden cut-out shapes varying in number of turns from 3 to 40 were presented to 48 6-12 yr olds (1st, 2nd, and 6th graders), both for voluntary haptic exploration and for preference choices. Both measures yielded monotonically increasing functions in the oldest group, while the youngest showed a similar but much flatter gradient for exploration times and an inverted-U shaped preference function; data for the 3rd graders were in both cases intermediate. Supplementary data based on an analysis of preference choice latencies for stimulus pairs of adjacent levels of complexity, as well as on ratings of S's mode of exploration of the stimuli under both response sets, showed a marked shift from a predominantly passive to an increasingly active mode of exploration. Results are related to the age differences for the exploration-time and preference data and discussed in relation to E. Schachtel's (1958) differentiation between allocentric and autocentric modes of perception.—*Journal abstract*.

4294. **Wong, T. S.** (U Stirling, Scotland) **A further examination of the developmental trend of the tactile horizontal-vertical illusion.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 149-150.—Reassessed the developmental trend in the tactile horizontal-vertical (HV) illusion, using an "L" figure as a stimulus and the

volar surface of the forearm as a receptor site. Data from 80 7-10 yr olds and 12 adults corroborate and extend previous findings that the tactile HV illusion when presented in either its "L" or "T" versions is found among both children and adults.

4295. **Yussen, Steven R. & Levy, Victor M.** (U Wisconsin, Madison) **Effects of warm and neutral models on the attention of observational learners.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 66-72.—Examined observers' attention to adults following warm and neutral interactions with them. 42 preschool and 36 3rd grade girls interacted with a pair of female models in 1 of 3 treatment conditions in which models were, respectively, warm and neutral, neutral and neutral, or warm and warm. Ss then witnessed the models play a picture-preference game and were asked to recall the models' responses. Analyses of Ss' overt attention to the models' responses revealed a greater attention to a warm model when in the presence of both a warm and neutral model and less distraction by nonsocial stimuli when at least 1 warm model was present. A significant positive correlation was obtained between attention to and recall of the models' responses.—*Journal abstract*.

(Rockland Children's Psychiatric Ctr, Orangeburg, NY) **Maternal discipline and children's judgments of moral intentionality.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 55-61.—In a study with 51 mothers of 1st, 3rd, and 6th graders, the children's level of moral intentionality was compared to mothers' self-reports on how they would treat the children in situations involving intention and damage. Measures included pairs of stories by A. Bandura and F. McDonald and P. Hebble's Intent Judgment Quotient procedure. Although there was no relation between the extent to which mothers reported intentional responding to their children and the children's level of intentionality, amount of punishment mothers reported they would give was significantly negatively related to intentionality in their children. Results are discussed in terms of the acquisition of intentionality. Findings support the conclusion that power-assertive discipline by parents is associated with less advanced moral development in children.—*Journal abstract*.
4309. Hildebrand, Verna. (Michigan State U) **Mothers' perceptions of independent and responsible behaviors of their preschool children.** *Psychological Reports*, 1975(Oct), Vol 37(2), 631-641.—27 tasks which are examples of independent and responsible behavior commonly learned during the preschool years were studied through a questionnaire completed by 242 mothers of 3-, 4-, and 5-yr-old males and females. The mother assessed the age-appropriateness of each task for her child, reported whether her child did the task voluntarily, when told, or never, and whether she expected the task to be done or not. Multivariate analysis of variance yielded significant findings. Age differences were in the expected direction. Females of each age did more tasks than males of the same age. The children did "being-alone" tasks most, "care-of-the-physical-self" tasks second, and "helping-in-the-home" tasks least. Implications for parental education and day-care teachers are discussed.—*Journal abstract*.

4312. Johnson, Roger A. & Khatena, Joe. (Old Dominion U, School of Education) **Oral and visual presentation and production of original responses.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 165-166.—Obtained verbal originality scores from Onomatopoeia and Images, Form 1B, given to 106 10-12 yr olds and 94 16-19 yr olds. Older Ss scored significantly higher than younger Ss with significant main effects for age but not for method of word presentation. A significant interaction was found between word presentation method and age. Older Ss were more original with the oral presentation while younger Ss performed approximately the same with both methods. *Journal abstract*.
4313. Kreidler, Schulamith; Zigler, Edward & Kreidler, Hans. (Tel-Aviv U, Israel) **The nature of curiosity in children.** *Journal of School Psychology*, 1975(Fal), Vol 13(3), 185-200.—Examined behaviors claimed to reflect curiosity to determine whether there are 1 or more types of curiosity. A secondary purpose was to examine the relations between the 1 or more types of curiosity and sex, social class, intelligence, achievement level, and ratings of personality traits. In 2 sessions 84 American 1st graders were administered 5 tasks which measured observation of complex and simple stimuli, preference of complex and simple stimuli, preference for the unknown, structure of meaning, and object exploration. A normalized Varimax factor analysis allowed the extraction of 5 factors: manipulatory curiosity, perceptual curiosity, conceptual curiosity, curiosity about the complex, and adjective-reactive curiosity. Only the 1st factor was related to a demographic variable, sex. The nature of the factors and their theoretical and practical significance are discussed. (38 ref)—*Journal abstract*.
4314. Lerner, Richard M. & Buehrig, Christie J. (Eastern Michigan U) **The development of racial attitudes in young Black and White children.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 45-54.—Assessed racial attitude development in 4 groups of Black and White children (374-, 385-, 406-, and 417-yr-olds) using a structured, open-ended interview employing black and white dolls as stimuli. The majority of statements made at each age level by both Black and White Ss were meaningful, as opposed to irrelevant, and Black and White at all age levels described both the black and white stimuli with responses that were preponderantly concrete, neutral in evaluative connotation, and nonpejorative. Findings contradict the results of racial attitude studies using forced-choice methods. The discrepant depictions of racial attitude structure in young children found by these 2 methods are discussed.—*Journal abstract*.

4315. Lerner, Richard M.; Karabenick, Stuart A. & Meisels, Murray. (Eastern Michigan U) **Effects of age and sex on the development of personal space schemata towards body build.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 91-101. Assessed personal space schemata of 202 White male and female children from kindergarten through 3rd grade using stimulus figures representing male and female endomorphs, mesomorphs, and ectomorphs. Greater distances were used toward the endomorph than towards the other 2 physiques at all grade levels, and there was a grade-associated increase in the use of space. Greater distances were generally maintained towards female stimuli, and Ss tended to come closer to same- than to opposite-sex stimuli. These sex differences were greater at higher grade levels but were less pronounced at all grade levels in reaction to the endomorph stimulus.—*Journal abstract*.

4316. Lerner, Richard M.; Karabenick, Stuart A. & Meisels, Murray. (Eastern Michigan U) **One-year stability of children's personal space schemata towards body build.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 151-152.—Reports findings from a 1-yr follow-up study of 22 4th graders' personal space preferences for 3 pictures of endomorphs, mesomorphs, and ectomorphs of about the same age and sex. Results indicate that substantial intraindividual stability exists in indices of interpersonal space orientation toward different body build stimuli, and that males and females continue to maintain a greater distance from endomorphs than from the other 2 body types from the 3rd to the 4th grade.

4317. Loeb, Roger C. (Cornell U) **Concomitants of boys' locus of control examined in parent-child interactions.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 859.

4318. Meier, Gilbert W. (U Nebraska, Medical Coll) **Behavioral development viewed in terms of conspecific communication.** In N. R. Ellis (Ed), *Aberrant development in infancy: Human and animal studies*. Hillsdale, NJ: Lawrence Erlbaum, 1975. viii, 287 p.—Discusses the nature of social interactions whereby the behaviors of 2 or more organisms are progressively and sequentially modified as the response of the one becomes the contingent stimulus to the response of the other, emphasizing the implications of these interactions for communication phenomena in newborns. Findings are discussed in relation to intervention programs for retarded and other at-risk infants. (3 p ref)

4319. Oliver, Laurel W. (U Maryland) **The relationship of parental attitudes and parent identification to career and homemaking orientation in college women.** *Journal of Vocational Behavior*, 1975(Aug), Vol 7(1), 1-12. Compared a total of 147 career- and homemaking-oriented college women on the variables of parental attitudes (father and mother acceptance, concentration, and avoidance) and parent identification (father or mother). A series of tests were administered, including the Adjective Check List, Parental Description Survey, and the Quick Word Test. Findings suggest that a girl's father is more important than her mother in determining the degree of her career commitment as an undergraduate. Career-oriented Ss perceived their fathers as significantly less accepting and were significantly more highly father-identified. Thus, results support the proposition

that antecedent family variables influence the development of motivational patterns associated with career and homemaking orientation in college women. The lesser father acceptance and greater father identification of the career-oriented group are viewed as being important in developing the relatively higher level of achievement motivation associated with stronger career commitment. (29 ref)—*Journal abstract*.

4320. Pawelkiewicz, Walter M. & McIntire, Walter G. (Farmington Public Schools, CT) **Field dependence-independence and self-esteem in pre-adolescent children.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 41-42.—Studied the field independence-dependence and self-esteem of 200 4th-6th grade boys and girls, using the portable rod-and-frame test and the Coopersmith Self-Esteem Inventory. Analysis of variance indicated that field-independent Ss had significantly higher self-esteem than middle-range and field-dependent Ss. A small significant correlation between field independence and high self-esteem obtained (-0.24), but only for boys.—*Journal abstract*.

4321. Perkins, Charlotte J. (Oregon State U) **A study of perceptual correlates to role-taking ability with fourth through sixth grade children.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1261-1262.

4324. Sharpe, Elliot M. (Washington U, St Louis) **An analysis of activities of children during free play in nursery schools.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1734-1735.

4325. Silbergeld, Sam; Manderscheid, Ronald W. & O'Neill, Patricia H. (NIMH, Mental Health Study Ctr, Adelphi, MD) **Free association anxiety and hostility: View from a junior high school.** *Psychological Reports*, 1975(Oct), Vol 37(2), 495-504.—Studied component and summary levels of free association anxiety and hostility in 43 junior high school adolescents (counselor and noncounselor groups derived from 4 brief interpersonal coping classes held at a recently integrated school. These groups consisted of those referred and those not referred by school guidance personnel. Both groups exhibited higher mean anxiety and hostility levels (measured by the L. A. Gottschalk et al protocol) than adult samples. Adolescent developmental provides 1 explanation for these differences. Comparison of the 2 adolescent groups showed that members of the Counselor Groups came from somewhat lower status backgrounds, experienced more academic difficulties, and exhibited higher mean anxiety and hostility levels. Analyses discriminated differences due to group, gender, and ethnicity. The concept of role incumbency is useful for explaining the variations observed. (25 ref)—*Journal abstract*.

4326. Sprafkin, Joyce N.; Liebert, Robert M. & Poulos, Rita W. (State U New York, Stony Brook) **Effects of a prosocial televised example on children's helping.** *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 115-126.—Investigated the possi-

bility that regularly broadcast entertainment TV programs can facilitate prosocial behavior in children. 15 male and 15 female 1st graders were individually exposed to 1 of 3 1/2-hr TV programs: a program from the *Lassie* series which included a dramatic example of a boy helping a dog, a program from the *Lassie* series devoid of such an example, or a program from the family situation comedy series the *Brady Bunch*. The effects of the programming were assessed by presenting each S with a situation that required him to choose between continuing to play a game for self-gain and helping puppies in distress. Ss exposed to the *Lassie* program with the helping scene helped for significantly more time than those exposed to either of the other programs. *Journal abstract*.

4327. Teele, Ann S. (Boston U, Graduate School) **Maternal influences on the development of social smiling in early infancy.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1763.

4328. Turner, Jesse D. (Miami U, OH) **An investigation of the role the imaginary companion plays in the social development of the child.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 429-430.

4329. Vacc, Nicholas A. & Greenleaf, William. (State University Coll New York, Fredonia) **Sequential development of cognitive complexity.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 319-322.—It has been demonstrated by J. Bieri and others that cognitive complexity is a meaningful personality construct for adults and older adolescents. The present study investigated by use of the Adapted Modified Role Repertory Test and the Modified Role Repertory Test possible developmental change in a child's system of role constructs (i.e., a child's ability to construe social behavior in a multidimensional way). Ss were 90 3rd, 99 5th, 90 7th, and 89 9th graders and 83 adults. Data suggest that with time a child's system of constructs becomes more differentiated. Therefore, development is accompanied by greater cognitive complexity.—*Journal abstract*.

4330. Wolf, Thomas M. (Louisiana State U, Medical Ctr, New Orleans) **Response consequences to televised modeled sex-inappropriate play behavior.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 35-44.—Exposed 70 male and 70 female 6-yr-olds to a same- or opposite-sex televised peer model who played with a sex-inappropriate toy for the children. The model was then administered positive, negative, or no consequences by a female adult figure. 10 boys and 10 girls were randomly assigned to each of 7 conditions using $2 \times 2 \times 2$ factorial design, with sex of S, sex of model, and response consequences (positive, negative, or none). There was also a control condition for each sex. Girls played with the sex inappropriate toy more than did boys following exposure to a model. For girls, play behavior with the sex-inappropriate toy was promoted most following exposure to a same-sex model with positive or no consequences. Girls rated the models as more attractive than did boys. (16 ref)—*Journal abstract*.

SOCIAL PROCESSES AND SOCIAL ISSUES

4331. Carlson, Helena M. & Sutton, Markley S. (U California, Riverside) **The effects of different police roles on attitudes and values.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 57-64.—Tested 3 hypotheses: (a) Authoritarianism and punitiveness will differ as a function of particular police roles (b) Police and police science majors will have more punitive attitudes than nonpolice. (c) Police will have a greater commitment to the ethics of social responsibility, while nonpolice will have a greater commitment to the ethics of personal conscience. 6 groups of Ss were examined: a nonpolice control group, police science majors, recruits at a police academy, jail personnel, patrol bureau personnel, and detective bureau personnel. Ss were 198 males, including 127 police and 71 nonpolice. Ss were administered the California F Scale, the Survey of Ethical Attitudes, the Attitudes Toward Punishment of Criminals Scale, and a vocabulary test. Results of a multivariate analysis of variance support all 3 hypotheses. (16 ref)—*Journal abstract*.

4332. Cook, Royer F.; Hostetter, Robert S. & Ramsay, Douglas A. (Inst for Research, Reston, VA) **Patterns of illicit drug use in the Army.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1013-1017.—Collected detailed histories of illicit drug use in the Army in individual interviews with a stratified random sample of 262 enlisted men at 6 military posts across the US. Approximately half of the Ss were classified as drug users; 90 of these were identified as career multiple-drug users. Most of these Ss used a variety of drugs in frequently changing patterns. The individualistic nature of drug use is emphasized, and the appropriateness of an addiction model for most users of illicit drugs is questioned.—*Journal abstract*.

4333. Goodwin, Leonard & Tu, Joseph. (Worcester Polytechnic Inst) **The social psychological basis for public acceptance of the social security system: The role for social research in public policy formation.** *American Psychologist*, 1975(Sep), Vol 30(9), 875-883.—Examined the issue of carrying out research that meets traditional standards of quality while bearing upon significant public issues. Measures of orientation toward social security were studied, using an opinion questionnaire administered in 615 home interviews in 3 cities. Results indicate that people are committed to social security because it is work-connected through the payroll tax. There is no dissatisfaction with the system by persons who appear to bear the brunt of its inequities. Factors related to willingness to pay into the system are noted. The question of why there has been no previous social psychological research on the social security program is considered, and ways of coping with this lack are suggested. (15 ref)—*R. Tomasko*.

4334. Greenley, James R.; Gillespie, David P. & Lindenthal, Jacob J. (U Wisconsin, Madison) **A race riot's effect on psychological symptoms.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1189-1195.—Certain individually stressful events have been observed to increase the psychological distress of persons affected; reduced psychological distress following other events has been attributed to collective processes.

including increased group cohesion. These possibilities were investigated by contrasting reported symptom levels of 938 adults interviewed before, during, and after a racial riot. White suburbanites interviewed after the riot and urban Black women interviewed during the riot reported significantly fewer psychological symptoms. The catchment area was composed of 2 distinct but contiguous areas, a $\frac{1}{2}$ -Black inner city area and a middle-class suburb. Hypotheses of seasonal symptom changes, sampling biases, and the absence of symptom changes among relatively unimpaired respondents are rejected, suggesting that reductions in symptom level are associated with the riot. Serious methodological problems are raised by the finding that such events may substantially affect not only rates but also patterns of reported psychological symptoms obtained through epidemiological studies. (52 ref)—*Journal abstract*.

4335. Klapp, Orrin E. (U Western Ontario, London, Canada) Opening and closing in open systems. *Behavioral Science*, 1975(Jul), Vol 20(4), 251-257.—Considers phenomena of collective behavior and suggests an amendment to the open social system model. Only under some conditions does a pluralistic society approximate J. S. Mill's description of the free market of ideas. A more accurate picture is continual oscillation between relative openness and closedness—resilient adjustment to intakes of information and states of entropy. When such oscillations are more fully analyzed as information games, better understanding may be gained of how open systems work, as well as of such phenomena as ethnic revivalism, cultic movements, backlashes, mass contagions, fads, and fashion cycles. (30 ref)—*Journal abstract*.

4336. Marris, Peter. (Ctr for Environmental Studies, London, England) Loss and change. Garden City, NY: Anchor Press/Doubleday, 1975. 192 p. \$2.95.—Discusses the psychological consequences of serious personal and social change. The concept of a conservative impulse which expresses itself in the human need to maintain continuity in goals and relationships is examined, and types of change, grief and bereavement, and implications for social policy are considered. (2 $\frac{1}{2}$ p ref)

4337. Newman, Graeme R. & Trilling, Carol. (State U New York, Albany) Public perceptions of criminal behavior: A review of the literature. *Criminal Justice & Behavior*, 1975(Sep), Vol 2(3), 217-236.—Summarizes the main trends of the literature and their significance for future research and correctional policy. 4 key aspects of deviance perception are identified—opinion, intensity of reaction, social definition, and societal reactions—and the studies reviewed are classified accordingly. It is concluded that strength of religiosity is an important factor mediating perceptions of deviance. However, in comparison to the extensive work in perceptions of mental illness, perceptions of crime have rarely been found to be affected by the various social class variables. A broad consensus concerning the severity of traditional criminal behavior is found in many studies. Lack of consensus is found concerning behavior which is more on the fringe of traditional crime, such as victimless crimes and some white-collar crimes. (4 p ref) *Journal abstract*.

4338. Paulston, Roland G. & LeRoy, Gregory. (Pittsburgh) Strategies for nonformal education. *Teach-*

ers College Record, 1975(May), Vol 76(4), 569-596.—Reviews and categorizes prescriptive nonformal educational (NFE) literature along the dimensions of (a) economic vs individual growth goals and (b) program control: external (to consumers) vs internal. Few studies or discussions of NFE programs that were initiated largely by the clients (i.e., those to be educated in the planned process) are found. When the purposes of such client-initiated NFE programs include efforts by the participants to negotiate new identities and change certain social structures, one finds (in the literature) a completely open field. NFE programs of the Scandinavian folk movement are considered exemplars of system relations in which the dominant elites did not have exclusive purview over setting the rules and goals. Other social class and ethnic movement NFE efforts are cited (in the US and Canada). While many NFE efforts emanate from and/or represent goals of the dominant cultural elites, NFE programs seem to play a possibly crucial role for groups of the deprived or deviant in seeking to define their identities and to obtain the power to fulfill their goals. (77 ref)—*L. Green*.

4339. Schoenfeld, William N. (Queens Coll, City U New York) Notes on a bit of psychological nonsense: "Race differences in intelligence." *International Journal of Mental Health*, 1974-75(Win), Vol 3(4), 27-45. Asserts that the idea of racial differences in intelligence is nonsense in the framing of the question, in the populations tested, in the instrument used, and in the "intelligence" that is postulated. The theme is viewed as pure fabrication, a discussion spun out of nothing but open linguistic categories and cultural fantasies. It is suggested that scientists, especially psychologists, should stop playing with the idea, since their support reinforces the biased opinions of laymen. Psychologists and others should agree that the issue is nonexistent, so that the real problems of race in our society can receive due attention.—*A. H. Alawi*.

4340. Sidel, Ruth & Sidel, Victor W. Education in the People's Republic of China: How many wheelbarrows of nightsoil do the Red Guards collect to serve the people of the commune? *Teachers College Record*, 1975(May), Vol 76(4), 605-616. Examines the educational process in China as a major tool for providing a basis for putting governmental authority into the hands of the people and improving life for those who formerly had least authority. Both physical and intellectual labor are regarded as productive and each as necessary for the other. Persons are expected to participate and become competent in both general spheres. Students thus learn the varied roles of citizens and the fact that they themselves are important to the proper functioning of their society. Education as such occurs throughout life, with the individual acting as student or teacher, depending on the needs of the situation.—*L. Green*.

4341. Thorne, Frederick C. The psychology of the exploding situation: A commentary. *Journal of Community Psychology*, 1975(Apr), Vol 3(2), 182-187.—Defines exploding situations as rapidly escalating chains of events or conditions which cumulate so quickly that etiological factors overwhelm normal control mechanisms. Vicious chain reactions of interpersonal relations and external events produce interactions which escape

from normal controls. An analysis of the dynamics of a series of cases (e.g., the Watergate affair, vandalism, Kent State incident, or riots) is presented to illustrate the nature of etiologic factors involved. Explosive situations require special and intensive methods of clinical study and disposition. Although criminal actions may occur in explosive situations, their dynamics usually are not criminalistic and criminal penalties should not be exacted.—*Journal summary.*

4342. Velarde, Albert J. (U Washington, Seattle) **Becoming prostituted.** *British Journal of Criminology*, 1975(Jul), Vol 15(3), 251-263.—Studied the ways a masseuse forms her self-identity, using recorded interviews with 15 masseuses, 2 husbands, and 4 owners of massage parlors. A labeling perspective is used to describe this identity formation through several stages: entrance into the occupation, learning the occupational requirements, the economic advantages of various occupational performances, the contemplation period, the attachment of the prostitute label, and the masseuse's reaction to the label. The increase in popularity of massage parlors and in the varieties of deviant activities offered is related to the labeling process. (15 ref)—*R. Tomasko.*

Social Structure & Social Roles

4343. Chase, Ivan D. (Dartmouth Coll) **A comparison of men's and women's intergenerational mobility in the United States.** *American Sociological Review*, 1975(Aug), Vol 40(4), 483-505.—Compares married men's and married women's intergenerational mobility in the US, using a nationally representative sample of 27,000 White married couples surveyed by the Bureau of the Census. The analyses show that women have greater mobility through marriage, both upward and downward, than men do through occupations, and women more readily cross boundaries among the major status groupings of white-collar, blue-collar, and farm. Men, on the other hand, are more likely to "inherit" their fathers' statuses, and there is greater association between the statuses of fathers and sons than between the statuses of fathers and daughters. An analysis for historical trends in the data indicates little evidence for either increasing fluidity or rigidity in the mobility system of either sex. (34 ref) *Journal abstract.*

4344. Cumming, Elaine. (U Victoria, Canada) **Prisons, shelters, and homeless men.** *Psychiatric Quarterly*, 1974, Vol 48(4), 496-504.—Views homelessness as the lack of any social home. The history, size, and characteristics of skid row populations are considered, together with society's response to homeless men. The roles of police, prisons, missions, and shelters are discussed, usage patterns of social agencies are reviewed, and the perspective homeless men have of mental hospitals is presented. The mental hospital is concluded to be an asylum for a proportion of the skid row population, with the only alternative being the mission or prison. *R. Tomasko.*

4345. Dalia, Joan T. & Guest, Avery M. (U Washington, Seattle) **Embourgeoisement among blue-collar workers?** *Sociological Quarterly*, 1975(Sum), Vol 16(3), 291-304.—Investigated the notion that blue-collar workers have been converting from working-class to middle-

class orientations as a consequence of gains in income and education over the past few decades. Cross-sectional analysis of survey data for 3,275 white workers and spouses reveals that a considerable manual-nonmanual subjective class schism persists when remaining differences in income and education are taken into account. Longitudinal analysis further indicates that embourgeoisement among blue-collar workers has been slight and suggests that the manual-nonmanual gap in class orientations is widening. (19 ref)

4346. Fengler, Alfred P. (Middlebury Coll) **Attitudinal orientations of wives toward their husbands' retirement.** *International Journal of Aging & Human Development*, 1975, Vol 6(2), 139-152.—Interviewed 73 30-77 yr old wives whose husbands were 50 yrs old or older and retired or approaching retirement. Results suggest that a variety of orientations toward their husbands' retirement was present. Some Ss expressed grave reservations; others looked forward to it; still others had no opinion. It is felt that an understanding of the wife's reaction to her husband's retirement can be useful in understanding the adjustments that both husband and wife may have to make in their relationship to each other. (22 ref) *—Journal abstract.*

4347. Grandjean, Burke D. & Bean, Frank D. (Russell Sage Foundation, New York, NY) **The Davis-Moore theory and perceptions of stratification: Some relevant evidence.** *Social Forces*, 1975(Sep), Vol 54(1), 166-180.—Used the concept of distributive justice to link perceptions of stratification with K. Davis and W. E. Moore's (1945) theory. 6 hypotheses were examined, using 1964 Italian survey data from 1,569 male heads of families. Findings indicate (a) respondents believed the Davis-Moore factors of functional importance, talent, and training are major influences on rewards; (b) actual rewards varied directly with perceived importance; and (c) with education; (d) there was no significant interaction effect between perceived importance and education in the determination of rewards; (e) rewards were much more strongly related to education than to perceived importance; and (f) education and importance were most strongly related to rewards in occupational groupings wherein status ascription was least. (34 ref)

4348. Gunn, John. (Inst of Psychiatry, London, England) **Prisons, shelters, and homeless men.** *Psychiatric Quarterly*, 1974, Vol 48(4), 505-512.—Considers the overlap of functions between prisons and mental hospitals. The movement to provide local facilities for psychiatric patients in Britain is discussed, along with alternative approaches to the problem of homelessness. It is argued that the incarceration or institutionalization of people should be avoided if at all possible, and the orientation of services around the patient's needs and desires is stressed.—*R. Tomasko.*

4349. Guy, Rebecca F. & Allen, Donald E. (Memphis State U) **The effect of social class on tolerance of defeat.** *Social Forces*, 1975(Sep), Vol 54(1), 160-165.—Experimental results indicate that the relation of tolerance for defeat (defined as a function of time) to social class level was positive. Middle-class Ss spent more time attempting to accomplish a difficult task than working-class Ss. Tolerance levels did not appear to be

affected by age or residence of S, ordering of tasks, or addition of tasks.

4350. **Harbison, Frederick H.** (Princeton U, Woodrow Wilson School of Public & International Affairs) **Education: Nationwide learning systems.** *Teachers College Record*, 1975(May), Vol 76(4), 539-562.—With the goal of reducing income disparities in mind, various strategies for assessing educational impact in developing nations are reviewed. It is noted that formal education and out-of-school learning activities work best when earning opportunities are expanding. Thus, rural and industrial development programs must be underway for benefits to accrue from educational investment. Better coordination of formal and nonformal education and examination of the potential for employer-as-trainer (i.e., analysis, improvement, and expansion of on-the-job training) are recommended. (16 ref)—*L. Green.*

4351. **Kapur, Veena.** (Catholic U of America) **Social character of women in the changing Indian society.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1278.

4352. **Lauer, Robert H.** **Occupational and religious mobility in a small city.** *Sociological Quarterly*, 1975(Sum), Vol 16(3), 380-392.—Analysis of data from a telephone survey of 1,270 adults in a small Midwestern city showed that occupational and religious mobility were not related per se; there was, however, a significant relationship between occupational mobility distance and religious mobility. Education was also significantly and positively related to occupational mobility. Highly educated individuals who were occupationally mobile across a great distance were the most religiously mobile group of all. There was also a tendency for the religiously mobile to move into high status Protestant denominations or out of the Christian religion altogether; this pattern was intensified among those who were highly mobile occupationally. Results suggest that religious mobility is a coping mechanism rather than a search for a more socially congruent context. (38 ref)—*Journal abstract.*

4353. **Lawton, M. Powell; Nahemow, Lucille & Teaff, Joseph.** (Philadelphia Geriatric Ctr, PA) **Housing characteristics and the well-being of elderly tenants in federally assisted housing.** *Journal of Gerontology*, 1975(Sep), Vol 30(5), 601-607.—Reports results of a study of the relationship between sponsorship, community size, and building size (number of units) and height, on the one hand, and indices of well-being of elderly tenants on the other hand. An impact of size smaller than anticipated is reported. (25 ref)

4354. **Manners, Robert A.** (Brandeis U) **Ivan Illich: Schooling and society.** *Teachers College Record*, 1975(May), Vol 76(4), 639-664.—Criticizes I. Illich's proposed deschooling program on the basis of (a) some facts of social life (e.g., people will simply not give up consumerism-materialism), (b) the notion that Illich has not supplied any satisfactory answers for reducing the major social ills, (c) rejection of sociological labeling theory (e.g., the distinction between person as object and person as subject is deemed meaningless), and (d) some possible consequences of deschooling (e.g., an illiterate society). The nature of established universities (the status quo) is such that it is more conducive to necessary

changes in societal structure than would be the changes (e.g., "disestablishment" of schools) proposed by Illich. (33 ref)—*L. Green.*

4355. **Schwartz, Arthur N.** (U Southern California, Andrus Gerontology Ctr) **An observation on self-esteem as the linchpin of quality of life for the aged: An essay.** *Gerontologist*, 1975(Oct), Vol 15(5, Pt 1), 470-472.—Argues that self-esteem is the most crucial factor in successful aging. The ideas that the behavior of the elderly cannot be adequately appraised except in the context of ongoing person-environment transactions and that the later decades in life are an integral part of the developmental continuum are discussed. The effect of aging impairments on self-esteem and implications for services to the elderly are considered.

4356. **Sorensen, Aage B.** (U Wisconsin, Madison) **The structure of intragenerational mobility.** *American Sociological Review*, 1975(Aug), Vol 40(4), 456-471.—Analyzes mobility rates for Black and White male adults, using life-history data on intragenerational mobility. Mobility is linked to the process of occupational achievement, and it is argued that job mobility is generated by persons' attempts to maximize their status and income. Since opportunities for better jobs will be fewer the higher the occupational achievement already attained, the rate of mobility will depend on time in the labor force. The mathematical formulation of this time dependency is derived from a simple change model for the occupational achievement process, making a redefinition of time possible and job shifts in the redefined time scale described a Poisson process. This enables a component in the formulation of a realistic and theoretically meaningful stochastic model of mobility to be obtained. The empirical analysis indicates that the proposed model describes the observed change in mobility rates over time reasonably well. (22 ref)—*Journal abstract.*

4357. **Storandt, Martha & Wittels, Ilene.** (Washington U, St Louis) **Maintenance of function in relocation of community-dwelling older adults.** *Journal of Gerontology*, 1975(Sep), Vol 30(5), 608-612.—Notes that relocation is often seen as a high-risk stress for the elderly. The present study compared relatively healthy older people moving voluntarily with nonmovers. 88 were 123 persons 62 yrs of age or over (or 100% handicapped) who had incomes, under \$5,200 for 1 person or \$5,900 for 2. An examination of behavioral test performance in a prepost design revealed no decrement in function among those who changed residence. The proscription against relocation of older adults would appear to best to temper with a careful examination of the conditions surrounding the move and the particular population involved. If there is risk in the relocation of the institutionalized aged, there appears to be no necessary comparable risk among the noninstitutionalized old. (22 ref)—*Journal abstract.*

4358. **Sweeney, William O.** (Ford Foundation International Div, New York NY) **The role of communications in the development process.** *Teachers College Record*, 1975(May), Vol 76(4), 597-604.—Discusses the means and advantages of and impediments to the combining of (a) the 1-way process of transmission of information and (b) the 2-way process of educating. It is suggested that on the level of national planning, that

population, agricultural, nutritional, and other concerns of developing countries), implementation of plans must include a national-local dialogue to facilitate the combining of information and education in the communication phases of the plans. —L. Green.

4359. Tiger, Lionel & Shepher, Joseph. (Rutgers State Women in the kibbutz. New York, NY: Harcourt Brace Jovanovich, 1975. viii, 334 p. \$10.95.—Presents findings of a study which examined the attitudes and experiences of females in an Israeli kibbutz where the political, economic, and military status of both sexes was equal. Topics include sex roles in the kibbutz movement, work patterns of kibbutz women, and general feelings of kibbutz members. (15 p ref)

4360. Tinker, John N. (U California, Los Angeles) The gatekeepers: A study of some social-psychological correlates of upward mobility among teaching candidates. *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3572-3573.

4361. Ward, F. Champion. (Ford Foundation, International Div, New York, NY) **Redirections in educational development.** *Teachers College Record*, 1975(May), Vol 76(4), 563-568.—Discusses the exigencies of external educational aid. The goal of universal education (i.e., to bring all citizens to the point of becoming agents, able to shape and respond to new economic and social opportunities) is seen as visionary. An exclusive dedication to the exploration of alternatives can be detrimental to the gleaning of useful information from projects and methods already tried or underway. Planned change requires a coherent agenda designed, managed, and assessed by nationals.—L. Green.

Culture & Ethnology & Religion

4362. Augustine, Morris J. & Kalish, Richard A. (Graduate Theological Union, Berkeley, CA) **Religion, transcendence, and appropriate death.** *Journal of Transpersonal Psychology*, 1975, Vol 7(1), 1-13. Reports findings from a series of semistructured interviews to obtain case material, anecdotes, and personal feelings about the role of religion for the dying. The 15 interviewees represented the fields of psychiatry, sociology, nursing, and the hospital chaplaincy. Findings suggest that religious convictions are relevant to the ability of a dying person to cope with his impending death, although the specific role of these convictions varies greatly in kind and importance. 2 secular factors that were thought instrumental in the coping process were warm and intimate relations with friends and the patient's knowledge of the nature of his affliction. Discussing one's own dying appeared to be a useful means of reducing anxiety in the terminally ill. Issues related to deathbed conversions and the importance of love and the idea of religion as a level of consciousness are discussed. It is concluded that knowledge of the religious belief systems of the dying can provide only a partial aid in understanding his coping process, to understand more fully a professional must be sensitive to how the patient communicates his ideas of transcendence and how to relate to him in his own vocabulary and meaning. —L. Gortez

4363. Ward, Richard J. & Faulkner, Joseph E. **Transcendentalism, U.S. Religiosity and secular attitudes:**

The case of Catholic Pentecostals. *Journal for the Scientific Study of Religion*, 1975(Sep), Vol 14(3), 257-270.—Indices of religiosity, of personal-motivational attitudes, of attitudes toward social activism, and a variety of social-demographic variables were examined for their relative impact on a number of social attitudes for 987 Roman Catholic Pentecostals. Results indicate that religiosity indices are associated only with those social attitudes having direct implications for ongoing doctrinal or church-related considerations. It is considered highly probable that the official church is having a decreasing influence on educated Catholics' attitudes toward both birth control and abortion. (31 ref)—*Journal abstract.*

4366. Colletta, N. J. (State University Coll New York, Buffalo) **Education without schools: Learning among the Ponapeans.** *Teachers College Record*, 1975(May), Vol 76(4), 625-637.—Discusses education among the people of Ponepe (Eastern Caroline Islands) who informally educate their children for practical and concrete knowledge of traditional role expectations. While child-rearing practices are generally indulgent, warm, and child centered until about 10 yrs of age, imitation of adult skills is strongly encouraged. Children are expected to help with family chores as soon as they can walk. This sets the pattern for all learning of skills: imitation and encouragement of practical knowledge in the setting and context of its usual use. Causal understanding, any type of secondary analysis of phenomena, and formal abstract conceptualization are not encouraged. A child wishing to learn a skill places himself in an informal voluntary apprenticeship and an adult with the requisite knowledge or skill. Imitation and rote memorization are in line with ascriptive roles and statuses; asking "why" (of any superior) is disrespectful. The fragmental nature of formal reasoning (experimental method) is not in line with the traditional relational wholistic world view of the Ponapeans.—L. Green.

4367. Dawson, John. (U Hong Kong) **Socio-economic differences in size-judgments of discs and coins by Chinese primary VI children in Hong Kong.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 107-110. Conducted an experiment which provides some cross-cultural support for the hypothesis by J. S. Bruner and C. C. Goodman (1947) about perceptual accentuation. 20 Hong Kong Chinese 11-12 yr olds from a lower socioeconomic level overestimated valued coins more than 15-11-12 yr olds from a high socioeconomic level. The 2 samples used were matched for education, and both spoke the Cantonese dialect. There was also some evidence for H. Tajfel's (1957) "interserial" and "intra-serial" effects more particularly for the lower socioeconomic Ss, although similar trends were apparent for the smaller group of higher socioeconomic Ss.—*Journal abstract.*

4368. Hanford, Jack T. (Ferris State Coll) **A synoptic approach: Resolving problems in empirical and phenomenological approaches to the psychology of religion.** *Journal for the Scientific Study of Religion*, 1975(Sep), Vol 14(3), 219-227.—Argues for a synoptic orientation for the study of the psychology of religion. The argument is derived from a historical review of the field, beginning with the problem of a coherent and comprehensive methodology, proceeding with definitions of the 2 traditional research orientations (the empirical and the phenomenological), showing their major weaknesses, and concluding with historical evidence in support of the thesis. An orientation is needed which includes the strengths of both views and which excludes their weaknesses. Such an orientation is the synoptic, which includes the rigor of empiricism without its reductionism and includes the challenge of the phenomenologists without their insufficient means for validity. 4373. Lerner, Richard M. & Schroeder, Christine. (Eastern Michigan U) **Racial attitudes in young white children: A methodological analysis.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 3-12. Compared 2 new racial attitude indexes with a traditional, forced-choice method of attitude assessment using 82 White kindergarteners. Ss were randomly assigned to 1 of 3 groups: Group 1 was presented with story-questions containing positive and negative evaluative adjectives and responded by choosing either a black or a white

doll; Ss in Group 2 chose an unimposed number of dolls from a group of 5 black and 5 white dolls in response to similar questions; and Group 3 Ss were administered a structured, open-ended interview to evaluate the way they described racial stimuli. Results indicate that as permitted response latitude varied from that involved in the conventional, forced-choice technique (Group 1), through the multiple-alternative method (Group 2), to the open-ended interview (Group 3), increasingly less evidence was found for the existence of pejorative, exceptionless racial stereotypes. The different structural representations of racial attitudes revealed by the 3 techniques are discussed.—*Journal abstract.*

4379. Rogers, Martha L. (US Air Force Medical Ctr, Adult Outpatient Mental Health Clinic, Lackland Air Force Base, TX) **A fundamentalist church as an autonomous community and its relationship to the larger community.** *Journal of Psychology & Theology*, 1975(Sum), Vol 3(3), 210-215.—Suggested that a small fundamentalist church can be defined as an autonomous community meeting many of its own needs. A questionnaire was used to study intra-community relationships, goals, and interaction with the larger community. The hypothesis of autonomy with little exchange with the larger community was confirmed while their primary goal, identified as bringing others to Christ, was seen to be thwarted by separatism. An individual's role in the church was largely predictable by sex, age, and marital status. Adolescents' responses suggested that neither their needs for spiritual guidance nor their social needs were being adequately met. —*Journal abstract.*

(U Florida) **Maintenance of the extended family in urban areas of Argentina, Brazil and Chile.** *Journal of Comparative Family Studies*, 1975(Spring), Vol 6(1), 31-45.—Ascertains the concomitants of nuclear and extended families in industrialized societies and determines cross-societal regularities regarding these factors. The analysis is based on data collected in sample surveys of 3 metropolitan areas: Buenos Aires, Rio de Janeiro, and Santiago. Age, social status, foreign extraction, migration, and social mobility were considered, and multiple discriminant analysis was used to determine the effects of the 5 variables. Results indicate that the model used satisfactorily predicts family composition in these urbanizing societies. However, a common configuration of factors related to 3-generation households was not found across societies. The importance of each specific element may be related to the stage at which these societies are in the formation of their urban-industrial structures. (4 p ref)—*Journal abstract.*

4395. Ernhart, Claire B. (Hofstra U) **Changes in authoritarian family ideology with childrearing experience.** *Psychological Reports*, 1975(Oct), Vol 37(2), 567-570.—Tested the hypothesis that authoritarianism, as measured by the Authoritarian Family Ideology Scale, might be related to desired family size. Since women desiring small families are less likely to be sampled in a later delivery (multiparous) sample, the parity (delivery order) effect found in past research may be due to sampling from populations which differed in more than childrearing experience. If the effect is due to childrearing, scores of women primiparous at 1st contact should change over several years of parenthood until they reach

the level of women who were multiparous at 1st contact. In the present study a sample of 309 White and 130 Black women first tested after the delivery of a child were retested 3 yrs later. Consistent with previous report, the parity effect was found for White Ss but not for Black; retest scores for both parities and races were lower than 1st test scores, but this decrease was greater for those White Ss who had been primiparous at 1st contact. Thus the initial difference associated with parity dissipated with childrearing experience.—*Journal abstract.*

4400. Lobodzinska, Barbara. (U Minnesota) **Love as a factor in marital decisions in contemporary Poland.** *Journal of Comparative Family Studies*, 1975(Spring), Vol 6(1), 56-73.—Discusses premarital behavior and attitudes in contemporary Poland, emphasizing the social sphere in which future spouses become acquainted and on motivations in marital decisions. The diminishing parental role in marital choices of young people and abatement of the economic factor in marital selections for traditional families are described. The analysis is based on a survey of 1,648 respondents to the *Warsaw Youth Daily* and from additional data. When males and females gave reasons for marriage, their opinions differed significantly. When speaking of themselves, both sexes claimed similar motives for marriage. Each sex indicated a sex-stereotypic reason for marital choice. The respondents did not consider their own decisions as being based on sex stereotypes, possibly indicating that sex stereotypes may no longer be taken for granted as a basis for marital decision. Parts of a more or less formal theory of the functions and dysfunctions of sex roles.** *American Sociological Review*, 1975(Aug), Vol 40(4), 445-455.—Analyzes the functions of sex-role ascription, based upon the assumption that many societies are organized around the conjugal family as the basic economic unit and that there are skills which each family must possess to be successful. It is concluded that when most families consist of male female pairs (with or without children) when mating is voluntary when the number of skills needed for successful family maintenance is large and

when most people are capable of acquiring the skills, the utility of ascription is maximal. When there is some scarcity of inherent aptitude and when societies are capable of identifying those individuals with aptitude, the functionality of ascription diminishes, and ascription eventually becomes dysfunctional. This latter set of conditions are those which tend to characterize modern industrial societies.—*Journal abstract.*

4408. Stetson, Dorothy M. (Atlantic U, Boca Raton, FL) **The two faces of policy: Divorce reform in western democracies.** *Journal of Comparative Family Studies*, 1975(Spring), Vol 6(1), 15-30.—Characterizes the recent reforms in divorce laws in Canada, Great Britain, Australia, New Zealand, and Italy. Various types of policy are discussed with emphasis on the extent to which they are effective in achieving stated goals of family stability. The pattern of government involvement in divorce is reviewed, and alternative policies for reform are described. Comparison of the statutes that have recently been revised indicates that, although governments formally seek to maintain standards of marital stability, none provides effective means for state action to assist in achieving the goal. In the case of divorce policy, the symbolic output satisfies interest groups, especially religious groups, and the real output answers needs of married couples for access to divorce. Test data on parents and 1 male 10-yr-old from 55 Canadian families are used to estimate father-son, mother-son, midparent-son, and father-mother correlations on 11 comparable subscales and on the verbal, performance, and total IQ aggregates. Heritabilities for these same scales are estimated as the regression of offspring on midparent values.—*Journal abstract.*

Political & Legal Processes

4414. Bazelon, David L. (US Court of Appeals, Washington, DC) **A jurist's view of psychiatry.** *Journal of Psychiatry & Law*, 1975(Sum), Vol 3(2), 175-190.—Discusses Judge D. Bazelon's disappointment with psychiatric testimony. The reasons for his current disillusionment with the role of the psychiatric witnesses are explored against the background of various court cases. The occurrence of factors, completely unrelated to a psychiatrist's medical expertise, which form the basis for a decision to commit or release is noted. Conflicts psychiatrists have with the courtroom adversary process are considered, along with their response to the *Durham* rule. Suggestions for improving expert psychiatric opinion are made. The model instruction to psychiatrists serving as expert witnesses that was developed in *Washington v. US* is appended.—R. Tomasko.

4415. Draber, Armin. [Group dynamics in criminal cases.] (Germ) *Gruppendynamik (Forschung und Praxis)*, 1974(Oct), Vol 5(5), 360-374.—Examines group dynamics as practiced in German courts which bear only some similarity to American procedures. The analysis is limited to the procedure before the courts where all participants involved in a criminal case appear together to reach a certain goal that proceeds according to determined rules and regulations. Roles, strategies, and mechanisms from a "sick" document of a case are presented which demonstrate how a criminal case can be decompensated when effective group dynamic factors remain unrecognized and unconsidered.—M. J. Stanford.

4416. Johnson, Frank M. (US Middle District Court, Montgomery, AL) **Court decisions and the social services.** *Social Work*, 1975(Sep), Vol 20(5), 343-347.—Discusses decisions in the federal courts that are increasingly affecting the delivery of social services in

state mental and penal institutions. The case of *Wyatt vs Stickney* is reviewed.

4417. Legant, Patricia. (Yale U) **The deserving victim: Effects of length of pretrial detention, crime severity, and juror attitudes on simulated jury decisions.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 857.

4418. Ogmundson, Rick. (U Manitoba, Canada) **Party class images and the class vote in Canada.** *American Sociological Review*, 1975(Aug), Vol 40(4), 506-512.—Reexamines the class vote in Canada, using data from a survey of the 1965 federal election and employing a new measure which takes into account voter perceptions of the class positions of the political parties. Results indicate that voter interest in class issues is greater than previously thought. This suggests that the main source of the anomaly associated with the apparent nonrelationship of social class to electoral politics in Canada resides, not with the Canadians themselves, but with the nature of the electoral options presented to them. This finding suggests that one cannot assume that the politics of a democracy faithfully reflect the salient concerns of its citizens. Conventional measures of voting behavior, which normally fail to take into account the variable nature of electoral options, provide a poor indicator of the nature of mass sentiment. (27 ref)—*Journal abstract*.

4419. Pollack, Dennis R. (Michigan State U) **The effect of need for social approval, political viewpoint, and type of crime on decisions of three-person mock juries.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1262.

4420. Pope, Carl E. (Criminal Justice Research Ctr, Latham, NY) **Defining morality: A note on the regulation and control of nude dancing in California bars.** *Criminal Justice & Behavior*, 1975(Sep), Vol 2(3), 276-296.—Examines the role of an administrative agency in attempting to suppress behavior which it deems to be morally objectionable. Data were obtained by means of participant observation and a systematic examination of case records. The regulatory nature of the agency and its relationship to local law enforcement, the behavior (bottomless dancing), and the methods utilized by the agency to eliminate the behavior are examined. Relevant state and appellate court decisions are considered, followed by an analysis of the problems generated by the agency's attempt to regulate moral standards.—*Journal abstract*.

4421. Robitscher, Jonas. (Emory U, Law School) **The impact of new legal standards on psychiatry or Who are David Bazelon and Thomas Szasz and why are they saying such terrible things about us? or Authoritarianism versus nihilism in legal psychiatry.** *Journal of Psychiatry & Law*, 1975(Sum), Vol 3(2), 151-174.—Proposes a branching out of psychiatry and law into a new area of "social legal psychiatry." The perspectives of Judge Bazelon and Dr. Szasz are discussed and criticized. Psychiatrists are considered to have extraordinary legal power but neglect using it in sufficiently self-conscious ways. Abuses of this power are also noted. Psychiatrists are encouraged to spend more time dealing with the social consequences of their exercise of authority and to be more discerning in differentiating

their medical and nonmedical functions. (52 ref)—*R. Tomasko*.

Psychosexual Behavior & Sex Roles

4422. Brody, Benjamin. (William Allanson White Inst of Psychiatry, Psychoanalysis & Psychology, New York, NY) **The sexual significance of the axillae.** *Psychiatry*, 1975(Aug), Vol 38(3), 278-289.—Reviews the literature discussing the relationship between the axillae and sexuality. Examples of this relationship are presented from clinical practice, everyday life, art, anthropology, mythology, and literature. Both human and primate physiological knowledge are considered, and the similarities between the axillae and the female genitals are noted. (24 ref)—*R. Tomasko*.

(Virginia Polytechnic Inst & State U) **Massage parlors and "hand whores": Some sociological observations.** *Journal of Sex Research*, 1975(Aug), Vol 11(3), 227-241.—Discusses the "executive" massage parlor as a delivery system for sexual services, the masseuses, and their clientele.—*E. B. Jaffa*.

4424. Cvetkovick, George; Grote, Barbara; Bjorseth, Ann & Sarkissian, Julia. (Western Washington State Coll) **On the psychology of adolescents' use of contraceptives.** *Journal of Sex Research*, 1975(Aug), Vol 11(3), 256-270.—Presents a conceptual scheme to account for the nonuse of contraception among sexually active adolescents who have had formal sex education and have contraception devices available to them. The adolescent's cognitive-emotional development is discussed, and practical methods for improving sex education are proposed. (37 ref)—*E. B. Jaffa*.

4425. Friedman, Richard C. (Columbia U, Coll of Physicians & Surgeons) **Critique of a hypothesis of dominance and sexual behavior.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 967-969.—Critically evaluates V. Abernethy's (see PA, Vol 53:1032) article "Dominance and Sexual Behavior. A Hypothesis," which hypothesized that "male dominance facilitates male-female copulatory behavior while female dominance inhibits it." The present author concludes that such unitary-cause hypotheses of complex behaviors may be reductionistic and therefore less helpful than intended.—*Journal abstract*.

4426. Gautney, Donald B. (U Houston) **Sexual attitudes and behavior of students attending a southwestern university: Relationships with current theory and related prior research.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1747-1748

4427. Goldberg, Steven. (City Coll City U, New York) **What is "normal"? Logical aspects of the question of homosexual behavior.** *Psychiatry*, 1975(Aug), Vol 38(3), 227-243.—Demonstrates that the assertion that an assessment of homosexual behavior as abnormal can be nothing more than a reflection of an arbitrary moral code is based on faulty logic. The relationship between etiology, symptomatology, and an assessment of normality is considered, and criteria by which normality or abnormality may be assessed are suggested. Behavior is considered abnormal if it elicits the pain of negative sanction and is generated by an abnormal causal factor.—*R. Tomasko*.

4428. Hart, Gavin. (Venereal Disease Control Div, Atlanta, GA) **Sexual behavior in a war environment.** *Journal of Sex Research*, 1975(Aug), Vol 11(3), 218-226.—Investigated the sexual behavior of Australian troops in Vietnam. Questionnaires were administered to 488 consecutive attenders at a VD clinic and 230 soldiers of similar rank randomly selected from the troop population. Masturbation, intercourse, and fellatio were the most frequently practiced sexual behaviors, while cunnilingus, anal intercourse, and homosexual behaviors were the least practiced. Findings demonstrate that environmental stress and relative peer acceptance may have had a marked effect on sexual behavior. The sexual output of any individual was markedly influenced by his sociological background.—E. B. Jaffa.

4429. Hesselund, Hans. (U Aarhus, Psychological Inst, Denmark) [Knowledge of sex, sexual experience, and attitudes toward sex of teacher trainees.] (Danish) *Skolepsykologi*, 1975, Vol 12(6), 459-483.—Studied 42 males (mean CA = 22 yrs) and 41 females (mean CA = 23 yrs) enrolled in a Danish teacher-training college. Ss responded anonymously to a questionnaire on their knowledge, experience of, and attitudes toward sex. Results indicate that the mean age for the first heterosexual experience was 17.5 for males and 17.0 for females, corresponding to previous investigations. About 20% of both sexes indicate some homosexual interests corresponding to previous figures for males. Knowledge was measured by Ss' response to 25 statements from sexual myths and superstition. Females showed a tendency to higher scores and the sexes were more relaxed with issues of relevance for their own sex. Knowledge was measured by Ss' definitions of 30 common sexual terms. 62% of the males and 83% of the females gave acceptable and excellent explanations, pointing to the need for teaching before entrance in the public school. There was correspondence between the 2 sexes in terms of preferred intercourse positions, experiences, and preferences. Females showed more flexibility in assumption of preferences. Attitudes toward sex roles showed some ambivalence but no clear sex distinction.—P. Mylov.

Drug & Alcohol Usage

4444. Abrams, Gary. (California School of Professional Psychology, Los Angeles) **Personality characteristics of drug abusers.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 866.

4445. Arthur, Gary L.; Sisson, P. Joe & Fallis, Charles L. (Georgia State U) **Follow-up drug survey: Trends in knowledge and attitudes of youth in a typical high school in Georgia.** *Journal of Drug Education*, 1975, Vol 5(3), 243-249. Conducted a follow-up survey to assess the changes in knowledge and existing attitudes or opinions about drugs by 1,188 freshmen through seniors from the same high school previously reported in a 1971 study. Results show that 60% possessed knowledge of the drug culture with very little difference from one grade to the next, but there was a reduction in awareness from one study to the next. In comparison to the 1971 study, there was a decrease in interest in all phases of drug usage. Noticeable changes between the 2 groups revealed a lessening in knowledge by the 1974 group concerning the effects of drugs, legal implications, and terminology. The 1974 study data indicated a softening of youth attitudes toward authority and a disinterest in drugs. Results support the present downward trend in the use of hard drugs and at the same time the continued use of marihuana. *Journal abstract.*

4446. Boyatzis, Richard E. (McBer & Co, Boston, MA) **The predisposition toward alcohol-related interpersonal aggression in men.** *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1196-1207.—149 25-50 yr old male social drinkers participated in experimental "parties" which were videotaped and coded for instances of interpersonal aggression. During a preliminary testing session, Ss completed an activities questionnaire, an adjective checklist, the TAT, and the California Psychological Inventory (CPI). A factor analysis of 30 variables derived from these measures and demographic information yielded 4 orthogonal factors accounting for 53.8% of the variance: (a) drinking (e.g., quantity and frequency of alcohol consumption, frequency of drunkenness, and time spent in places where alcohol was available), (b) ascendancy (e.g., characteristics associated with maturity and initiative), (c) social integration (e.g., the degree to which a person has been socialized or has internalized societal norms), and (d) impulsive-competitive. Results show that heavy consumption was related to interpersonal aggression and that Ss with a history of arguments and other aggressive acts and low scores on measures of socialization, self-control, and responsibility exhibited

more interpersonal aggression after heavy drinking. (25 ref)—*L. Gorsey.*

4447. Cutler, R. E. & Storm, Thomas. (Alcoholism Foundation of British Columbia, Vancouver, Canada) **Observational study of alcohol consumption in natural settings: The Vancouver beer parlor.** *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1173-1183.—Internal and external observations of 877 patrons in 25 Canadian beer parlors indicate that the rate of drinking was relatively constant. Total consumption and blood alcohol concentration depended primarily on duration of the occasion, which in turn was related to size of the drinking group.—*Journal abstract.*

4448. Evans, Gary W.; Dewart, Ted & Blank, Karen. (U California, Irvine) **Drug knowledge and the university.** *Journal of Drug Education*, 1975, Vol 5(3), 205-216.—Surveyed 635 college students and 69 staff and faculty members at a university about general knowledge, usage, and quantity of drugs used. Overall, Ss were particularly ignorant of opiates, barbiturates, cocaine, hallucinogens, and general legal questions. Ss underestimated the seriousness and extent of alcohol abuse, viewed both aspirin and marihuana as harmless drugs, overemphasized the relative dangers of opiates and heroin (vs barbiturates), were unaware of the potency or general physical form, believed incorrectly that amphetamines create energy, overestimated the use of cocaine, and were confused about quantities of drugs required for conviction and legal search procedures. 75.5% of the Ss did not clearly understand the concept of drug tolerance. Suggestions for drug education programs at the university level are presented.—*L. Gorsey.*

4449. Fritzen, Robert D. & Mazer, Gil E. (U Arizona Hosp) **The effects of fear appeal and communication upon attitudes toward alcohol consumption.** *Journal of Drug Education*, 1975, Vol 5(2), 171-181. Investigated the relationship between the fear appeal of a message and the character of the communicator and the attitudes, behavior, and information retention of 417 7th and 8th graders with respect to the consumption of alcoholic beverages. Results suggest that high fear messages given by a nonalcoholic communicator were more effective in eliciting more conservative attitudinal positions about alcohol consumption, although this effectiveness was not related to actual behavior change.

4450. Gallagher, John A. **A comparison between students and teachers attitudes toward adolescent alcohol and marijuana users and dogmatism.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3057-3058.

4451. Galli, Nicholas A. (U Illinois, Urbana-Champaign) **A comparative analysis of the attitudes and behaviors of school children (selected grades 4-12) and their parents toward drugs.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 730-731.

4452. Goodstadt, Michael S. (Ontario Addiction Research Foundation, Toronto, Canada) **Impact and roles of drug information in drug education.** *Journal of Drug Education*, 1975, Vol 5(3), 223-233. Presents evidence to clarify the role of knowledge about drugs in facilitating or impeding drug use. Issues considered include (a) the role of drug information in previous "education" programs, (b) the source and uses of drug

information, (c) the impact of this information, and (d) the alternative roles for drug information. The need for multifaceted approaches to drug education which include a more complete psychological and social definition of man is stressed. (18 ref)—*Journal abstract*.

4453. Graham, Donovan L. & Cross, William C. (Covenant Coll) **Values and attitudes of high school drug users.** *Journal of Drug Education*, 1975, Vol 5(2), 97-107.—Administered the Philosophical Attitude Description Inventory (PADI) by E. Van Meter and a personal attitude questionnaire (PAQ) to 700 11th and 12th graders in a middle-class midwestern school. A factor analysis of the PADI yielded 5 factors related to philosophical orientation (individualistic, religious, human subjectivity, rational-conventional, and reality-knowledge). The PAQ yielded 4 attitudinal factors, 2 related to peer group relationships and 2 related to school milieu, 2 personal factors similar to those in the PADI, and 1 factor relating to parent-child interaction. A discriminant model using 6 of the above factors (parent-child separation, nonstructured lifestyle, religious orientation, liberal school atmosphere, human subjectivity orientation, and individualistic orientation) correctly identified 74% of the non-drug users and 79.5% of the users. Findings support previous studies which showed that drug users seemed to value aesthetics, feelings, and experience over science, planning, and logic. Implications for rehabilitation and drug abuse prevention programs are noted.—*L. Gorsey*.

4454. Gregory, Robert J. (Duke U, Medical Ctr, Behavioral Neuropharmacology Section) **Cultural changes and the drug scene.** *Journal of Drug Education*, 1975, Vol 5(3), 275-283.—Uses an anthropological perspective to analyze American society and the contemporary drug scene, and discusses shifts in value orientation, in social structure, and in activity. In this view, the drug scene appears to be in the vanguard of social change.

4455. Grossman, Della S. (U Pennsylvania) **Academic variables associated with marijuana use in a Catholic college.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 392-393.

4456. Guinn, Robert. (Pan American U) **Characteristics of drug use among Mexican-American students.** *Journal of Drug Education*, 1975, Vol 5(3), 235-241.—Administered an 88-item questionnaire to 1,789 Mexican-American high school students to determine the relationship of drug use to socioeconomic status (SES), attitudes toward drugs, academic achievement and participation in school-related activities, and demographic characteristics. 254 students were identified as drug users from the total sample in 1 junior and 11 senior high schools in Texas. Results show that (a) educational level and occupation of the drug users' fathers were significantly higher than that of the total sample; (b) a higher percentage of users than Ss in the total sample felt that drugs were used to express feelings more easily; (c) drug users had lower GPAs, higher rates of absenteeism, and lower rates of church attendance than the total sample. Other findings suggest that the typical Mexican-American high school drug user tends to be from a higher SES level and have a relatively unstable family background. Boredom created by a lack of participation

in school activities also appeared to be a precipitating factor in drug use. Use of drugs by males was twice that of females.—*L. Gorsey*.

4457. Helstad, Gordon T.; Zimmermann, Robert L. & Wong, Martin R. (U Minnesota) **Measuring changes in attitude toward drug abuse: A preliminary report of a method.** *Journal of Drug Education*, 1975, Vol 5(2), 127-140.—Compared 100 nonopiate drug abusers with 100 psychiatric patients, matched for age, from a community mental health center. Data indicate that the drug abusers and psychiatric patients were similar, although the drug abusers showed small, but consistent evidence of greater psychosocial adjustment problems.

4458. Horan, John J.; D'Amico, Mary M. & Williams, John M. (Pennsylvania State U) **Assertiveness and patterns of drug use: A pilot study.** *Journal of Drug Education*, 1975, Vol 5(3), 217-221.—Studied the relationship between assertiveness (measured by the Rathus Assertiveness Schedule) and patterns of drug use in 80 undergraduates. It was found that exploratory use of marihuana and hashish was the norm among this sample. Furthermore, current users and those who had never used such drugs were considerably less assertive than those who had experienced these drugs but no longer used them. The usefulness of including assertiveness training in drug education programs is discussed.—*Journal abstract*.

4459. Kochansky, Gerald E.; Hemenway, Thomas S.; Salzman, Carl & Shader, Richard I. (Massachusetts Mental Health Ctr, Psychopharmacology Lab, Boston) **Methaqualone abusers: A preliminary survey of college students.** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 348-351.—Administered the MMPI Depression subscale, the Taylor Manifest Anxiety Scale, the Choice Dilemmas Questionnaire, the Eysenck Personality Inventory, and a side effect checklist to 25 undergraduates, of whom 15 were methaqualone users. A larger proportion of the methaqualone users had experimented with a wide variety of psychoactive drugs (e.g., amphetamines, hallucinogens, and barbiturates) than had the nonusers. Side effects most frequently mentioned by the users included lightheadedness or dizziness, numbness of extremities, unsteady gait, detached and unreal feeling, impaired or blurred vision, and generalized weakness and drowsiness. 10 of the 15 users reported that methaqualone increased sexual arousal. No significant psychological or personality test differences were found between the users and nonusers. Only 2 users reported any adverse reactions to the drug. (15 ref)—*L. Gorsey*.

4460. Ladner, Robert A.; Russe, Brian R. & Weppner, Robert S. (U Miami, Medical School, FL) **Acute and chronic drug problems responsible for emergency hospital admissions: A preliminary analysis of complaint, drug and response.** *Journal of Psychedelic Drugs*, 1975(Apr-Jun), Vol 7(2), 215-228.—Examined patient records of 2,220 consecutive hospital drug-abuse admissions during 1973-1974. Alcohol-related admissions were excluded. Overdose is the largest single problem noted, although many of the other problems represent more long-term concerns. Demographic characteristics are related to the type of drug used and type of drug problem encountered. Topics discussed include complaint at admission, nature of functional impairment,

and are disposition. The importance of the way drug problems are conceptualized in the provision of patient services is noted. (27 ref)—*R. Tomasko.*

4461. **Light, Patricia K.** (Harvard U) **Let the children speak: A psychological study of young teenagers and drugs.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1278-1279.

4463. **Padelford, Betty L.** (United States International U) **Relationship between drug involvement and purpose in life.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1756-1757.

4464. **Paredes, Alfonso.** (U Oklahoma, Health Sciences Ctr) **Social control of drinking among the Aztec Indians of Mesoamerica.** *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1139-1153.—Historical evidence suggests that the Aztec culture of pre-Columbian Mexico rules for the use of alcoholic beverages were clearly defined and strictly enforced. Drinking was permitted only on religious occasions and the amount consumed was restricted. (24 ref)

4465. **Robinson, Paul E.** (Oberlin Coll, Psychological Services) **Beyond drug education.** *Journal of Drug Education*, 1975, Vol 5(3), 183-191.—Argues that current drug education approaches are failing to help stem the tide of drug use and misuse because their goals, expectations, and methodologies are irresponsible and ill-informed. The abandonment of all drug education attempts that begin and end with a discussion of drugs and their effects is urged; rather than teach people about drugs, education of the self should be stressed. Methodologies utilizing admonishment, indoctrination, persuasion, distortion, and fear should be abandoned. The point is made that in a society as complex, dynamic, and perplexing as American society, young people must be given opportunities to develop the personal, intellectual, and emotional resources to live meaningfully, responsibly, and responsibly in a new world.—*Journal abstract.*

4466. **Shafii, Mohammad; Lavelly, Richard & Jaffe, Robert.** (U Louisville, Medical School) **Meditation and the prevention of alcohol abuse.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 942-945.—Surveyed the frequency of alcohol use in individuals identified as practitioners of Transcendental Meditation ($n = 126$) and a matched group ($n = 90$). No control Ss reported discontinuation of beer and wine use; 40% of Ss who had meditated for more than 2 yrs reported discontinuation within the first 6 mo. After 25-39 mo of meditation, this figure increased to 60%. In addition, 54% of this group, vs 1% of the control group, had stopped drinking hard liquor. It is suggested that meditation could be an effective preventive tool in the area of alcohol abuse.—*Journal abstract.*

4467. **Simpson, M. L. & Koenig, F. W.** (Southern U, Training Program for the Control of Drug Abuse, New Orleans) **The use of the semantic differential technique in drug education research: An example and some suggestions.** *Journal of Drug Education*, 1975, Vol 5(3), 251-259.—Suggests that the semantic differential (SD) technique is an efficient and reliable instrument for measuring attitudes in drug education programs. A

survey of 67 high school students was conducted using the SD technique with the concepts "myself," "a drug education teacher," "a marijuana smoker," "an alcoholic," and "a drug addict" and bipolar adjectives selected for their relevance to drug use (e.g., strong-weak, healthy-sick, active-passive, clean-dirty, and smart-stupid). Overall findings show that the SD is a sensitive instrument which can reveal gradations in attitudes toward drug users. Suggested uses of the SD in drug education are discussed, and selected dimensions for tapping various attitude components are outlined. (17 ref)—*L. Gorsey.*

4468. **Stein, Kenneth B.; Soskin, William F. & Korchin, Sheldon J.** (U California, Berkeley) **Drug use among disaffected high school youth.** *Journal of Drug Education*, 1975, Vol 5(3), 193-203.—Studied drug use among 281 disaffected students in 3 different high schools: public urban, public suburban, and private residential. The disaffected youths were volunteer participants in Project Community, a growth program for the more "turned off" adolescents. Results show that disaffected urban and suburban Ss were greater drug users than their respective matched controls (nonparticipants). No differences were found between groups in the residential school. Greater drug use was found in suburban and private residential schools than in the urban setting. (15 ref)—*Journal abstract.*

4469. **Sterling, Theodore D. & Kobayashi, Diana.** (Simon Fraser U, Burnaby, Canada) **A critical review of reports on the effects of smoking on sex and fertility.** *Journal of Sex Research*, 1975(Aug), Vol 11(3), 201-217.—Discusses clinical and experimental evidence and evaluates the methods used for studies on the relationship of smoking and sexual behavior and fertility. It is concluded that the data do not support the hypothesis that smoking or tobacco extracts have an effect on sexual activity or procreation.—*E. B. Jaffa.*

4470. **Tzeng, Oliver C. & Skafidas, Thomas.** (U Illinois, Ctr for Comparative Psycholinguistics, Champaign) **Differentiation of psychoactive drug users and non-users and prediction of their using intention.** *Journal of Drug Education*, 1975, Vol 5(3), 261-273.—Measured 13 semantic differential bipolar variables representing various sociocultural correlates and personality factors of psychoactive drug users and nonusers in 80 college students and 20 adults of both sexes. 44 Ss who used drugs in the last 6 mo differed significantly from nonusers in their intention of taking psychoactive drugs if provided. No sex differences in intention within either the user or nonuser group were found. Significant differences between user and nonuser groups covered 3 broad areas: experiences of personal development, knowledge and attitudes toward drug use of individuals and their peers, and opinions and persuasions of established conventional institutions in politics, church, and social standards. The order of importance of the different variables in predicting the intention of psychoactive drug use (or no use) also found not the same for both users and nonusers of the 2 sexes. (16 ref)—*Journal abstract.*

4471. **Whitehead, Paul C. et al.** (U Western Ontario, London, Canada) **Collision behavior of young drivers: Impact of the change in the age of majority.** *Journal of*

Studies on Alcohol, 1975(Sep), Vol 36(9), 1208-1223.—A comparison of the number of collisions experienced by young male drivers in London, Ontario, before and after the reduction in the legal age for drinking and purchasing alcoholic beverages from 21 to 18, indicated that the change in the law led to an increase in the collision involvement of young drivers.

EXPERIMENTAL SOCIAL PSYCHOLOGY

4472. Alpers, Burton L. (California State U, Los Angeles) **A Boolean analysis of interpersonal perception.** *Human Relations*, 1975(Sep), Vol 28(7), 627-652.—R. D. Laing et al's (1966) Interpersonal Perception Method (IPM) was developed to determine the degree to which the members of a dyad agree on important issues, understand one another, feel understood, and realize the understanding of the other member. Unfortunately, a number of problems make it unlikely that the potential of the IPM will be realized: (a) It is nearly impossible to avoid getting tangled in complex semantics. (b) Relationships among terms are obscure. (c) Derivation of terms is intuitive and sometimes ambiguous. (d) Scoring procedures are tedious and difficult. Boolean analysis of the IPM removes the need for intuitive derivations of terms, clarifies the structure of IPM relationships, substantially reduces scoring efforts, and provides a rigorous substructure for the IPM which allows it to be developed as a general method for the study of interpersonal phenomenology. A general technique for the derivation of terms is demonstrated, and a sample set of determinations for evaluation of marital therapy is derived.—*Journal abstract*.

4484. Johnson, Keith R. & Powell, Thomas R. (Illinois Inst of Technology) **Levels of response to stimulus letters.** *Psychological Reports*, 1975(Oct), Vol 37(2), 378.—Because passersby systematically ignored stimulus letters to and from a political candidate while picking up control letters, it is suggested that level of response may be a more salient measure of public response than the commonly used return rate.

4485. Klabbers, J. H. (Katholieke U Nijmegen, Social Systems Research Group, Netherlands) **General system theory and social systems: A methodology for the social sciences.** *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1975(Aug), Vol 30(6), 493-515.—Reviews general systems theory as it applies to the social system. When the social system is abstract and logically consistent, it is defined as a mathematical system. When a number of mathematical systems indicate a common structure, a metasystem is identified. The social system is viewed as being dynamic, evolutionary, hierarchically organized, stochastic, nondeterministic, and fuzzy. The hierarchical or multilevel of the social system emphasizes the interconnection of decision-making subsystems. In the development of an integrated model of a social system, 3 strata are identifiable: (a) causal, (b) decision-

making, and (c) the norm. Models of "a" are represented by dynamic and stochastic designs; "b" is describable by a characteristic fuzziness, and "c" by linguistic variables. The simulation technique can advantageously use digital computers to appraise the effectiveness of general systems theory (30 ref)—A. J. Ter Keurst.

4486. **Lenk, Hans & Lüschen, Günther.** Epistemological problems and the personality and social system in social psychology. *Theory & Decisions*, 1975(Aug), Vol 6(3), 333-355. Considers epistemological problems dealing with the generality of theory and explanation, behavioristic vs action approaches, and operational and model structural implications. The need is stressed for a better understanding of social system variables besides those of the personality system and of system theory in general. The area of sport is used as an example, because it composes a complex system that is not difficult to observe and shows in relative clarity all of the different levels of an action system. The use of field-study methods will help to reverse the trend characterized by a general neglect of theory resulting from behavioral dogmatism and the expedience of research pragmatism based on 2-variable linear models. Rigorous research design and data analysis should be done in the context of broader theoretical concerns and in clear recognition of the pitfalls of operationalism and the merits of action theory. (42 ref)—*Journal abstract*.

4487. **Palmer, Anthony & Bailey, Robert.** (U Sussex, Brighton, England) Sex differences and the statistics of crowd fluids. *Behavioral Science*, 1975(Jul), Vol 20(4), 223-227.—L. F. Henderson (1971) suggested that the classical Maxwell-Boltzman theory of the molecular system might also describe the distribution of velocities found in the movement of people. Henderson's empirical results, showing deviations near the modes of the velocity distributions, were attributed to sexual inhomogeneity in the sampled population. The present study gathered empirical data on 814 male and 811 female pedestrians which confirm Henderson's sexual inhomogeneity conjecture. It is shown that the observed velocities of people's movements obey a normal distribution, and as the Maxwell-Boltzman distribution is equivalent to the normal distribution in the 1-dimensional situations described, there is no need to invoke the statistics of molecular systems to describe those of the movements of people.—*Journal abstract*.

4488. **Rogers, Ronald W.** (U South Carolina) A protection motivation theory of fear appeals and attitude change. *Journal of Psychology*, 1975(Sep), Vol 91(1), 93-114.—Proposes a protection motivation theory that postulates the 3 crucial components of a fear appeal to be (a) the magnitude of noxiousness of a depicted event, (b) the probability of that event's occurrence, and (c) the efficacy of a protective response. Each of these communication variables initiates corresponding cognitive appraisal processes that mediate attitude change. The proposed conceptualization is a special case of a more comprehensive theoretical schema: expectancy-value theories. Several suggestions are offered for reinterpreting existing data, designing new types of empirical research, and making future studies more comparable. The principal advantages of protection motivation theory over the rival formulations of I. L.

Janis and of H. Leventhal are discussed. (81 ref)—*Journal abstract*.

4492. **Bakeman, Roger & Helmreich, Robert.** (Georgia State U) Cohesiveness and performance: Covariation and causality in an undersea environment. *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 478-489.—Studied the relationship between group cohesiveness and performance, using data from a field setting. Ss were 40 scientists and 8 engineers. An index of leisure time cohesion correlated highly with work performance, accounting for 42% of performance variance. Although many studies assume that cohesiveness causes performance, in many contexts the dominant direction of causality may be from performance to cohesiveness instead. Laboratory experimental studies impose a causal direction and thus cannot answer a question of this kind. It is concluded, at least in the context of this study, that cohesiveness was not an important determinant of performance, but that good performance may well have been a cause of cohesiveness. (23 ref)—*Journal abstract*.

4493. **Bartunek, Jean M.; Benton, Alan A. & Keys, Christopher B.** (U Illinois, Chicago Circle) Third party intervention and the bargaining behavior of group representatives. *Journal of Conflict Resolution*, 1975(Sep), Vol 19(3), 532-557. Compared the effects of content, process, and passive types of 3rd-party intervention on the bargaining behavior of pairs of group representatives. The setting was a simulated school board teachers' union dispute over a new contract. Each side was represented by 1 person who was instructed to bargain tenaciously and to obtain as much as possible. The job of the representatives (216 male undergraduates) was either in jeopardy (high accountability) or not (low accountability). In the content intervention condition, a reasonable settlement was suggested to the representatives by the 3rd party. In the process intervention condition, he taught them how to paraphrase. In the passive condition, he had them take a break from their negotiations. For the high accountable representatives, as predicted, the order of effectiveness of the interventions, from most to least, was content, process and passive. The process intervention did not produce the highest average joint profit for the low accountability representatives. The representatives who did reach agreement in the low accountability process and content conditions, however, achieved higher joint profits than the representatives in the passive condition. (45 ref)—*Journal abstract*.

4494. Baumgartner, T.; Buckley, W. & Burns, T. (U New Hampshire) **Relational control: The human structuring of cooperation and conflict.** *Journal of Conflict Resolution*, 1975(Sep), Vol 19(3), 417-440.—Introduces a theoretical perspective based on the concept of relational control, the exercise of control over social relationships. 3 of the principal ways human agents structure cooperation and conflict among persons and groups are focused on: control of interaction and organizational opportunities, control of differential payoffs or outcomes of interaction, and control over cultural and ideological orientations of actors in relation to one another. Divide-and-rule strategies used to structure noncooperative or conflictive social relationships are considered. The role of the state in regulating management-labor relationships in industrialized or industrializing societies is examined to illustrate the structuring of more cooperative relationships. Parallels to the analysis of international relations are suggested. (32 ref)—*Journal abstract.*

4495. Bavelas, Janet B. (U Victoria, Canada) **Systems analysis of dyadic interaction: The role of interpersonal judgment.** *Behavioral Science*, 1975(Jul), Vol 20(4), 213-222.—Argues that dyadic interaction should be studied as a formal system, with the behaviors of each individual studied separately in such a way that the whole can be constructed from the parts. A mechanism for such interaction is interpersonal judgments. In 2 experiments, 90 undergraduates acting as teachers were given performance scores and asked to select goals for students. Their responses were a linear function of the performance score, independent of their assigned aim or the students' task. High norms and actual teaching experience lowered the goals chosen but did not affect the shape of the function. An illustration of the use of this data in a model of dyadic interaction leading to a self-fulfilling prophesy is given. (24 ref)—*Journal abstract.*

(U California, Social Sciences School, Irvine) **Group size and cooperation.** *Journal of Conflict Resolution*, 1975(Sep), Vol 19(3), 503-531.—Introduces a class of simple multiperson games to compare the effects of group size on cooperation. These games can be regarded as *n*-person generalizations of 2-person Prisoner's Dilemma with expected value payoffs. To ensure that identical expected-value monetary alternatives are available to players in different-sized groups, a certain formal constraint on payoffs is introduced. Results of an experimental study, with 160 undergraduates, comparing 3- and 7-person groups show that the smaller-sized group was markedly more cooperative than the larger. The paper demonstrates a technique to measure cooperation as a function of group size unconfounded by role-playing and utility considerations.—*Journal abstract.*

4508. Lebra, Takie S. (U Hawaii) **An alternative approach to reciprocity.** *American Anthropologist*, 1975(Sep), Vol 77(3), 550-565.—Defines reciprocity as a subset of exchange characterized by inseparability of the objects exchanged from the partners in interaction. M. D. Sahlin's model of reciprocity, which equates kinship proximity, solidarity, and generosity, is brought into question. A solution to problems inherent in this model is sought in an elaboration of sociability into intimacy and courtesy conveying different social values and in taking into consideration both the positive and negative manifestations of sociability. The exchange aspect of reciprocity is characterized by 2 strains—1 toward symmetry and 1 toward asymmetry—operating simultaneously, alternately, at different levels of communication. Asymmetric strain is accounted for by the convertibility of exchange objects and complementarity between partners. The dyadic reciprocity is extended to a triad which either reinforces or suppresses reciprocal expectations. 7 types of triadization are recognized—circular transference, lineal transference, unstructured transfer-

ence, triadic sanction, brokerage, competition, and transitivity. (2 p ref)—*Journal abstract.*

4515. Nakazato, Hiroaki; Inoue, Tooru & Tanaka, Kunio. (Kwansei Gakuin U, Nishinomiya, Japan) **[Personality similarity and interpersonal attraction: On the dimensions of extraversion and need.]** (Japn) *Japanese Journal of Psychology*, 1975(Jun), Vol 46(2), 109-117. —Investigated the determining effect of personality similarity upon interpersonal attraction. Extraversion and need were used as personality dimensions. In an examination of the 1st dimension, a total of 60 extraverts and introverts rated 2 standard strangers (one extraverted and the other introverted) on interpersonal judgment scales. Generally, Ss were attracted to the extraverted stranger. In a study of the 2nd dimension (need) complementarity and the similarity hypothesis were examined. Another 80 Ss rated 2 strangers (nurturant and succorant). Similarity effect was evident on nurturance, but not explicit on succorance. The complementarity effect was only slightly apparent. Thus, the mediating factors underlying personality similarity and attraction are suggested. (15 ref)—*English abstract.*

4516. Nydegger, Rudy V. (Rice U) **Leadership in small groups: A rewards-cost analysis.** *Small Group Behavior*, 1975(Aug), Vol 6(3), 353-368. —Studied how verbal output relates to emergent leadership in small groups. 96 psychology students were randomly assigned to 4-person groups, 8 groups under each of 3 conditions: no reinforcement, reinforcement for agreeing with target, and reinforcement for disagreeing with target. "Target" was the group member who, after an initial 10-min discussion, was ranked by the group as third in verbal output and leadership. In a 2nd 10-min discussion the target was reinforced for talking and punished for silence, while the other Ss were reinforced for agreeing or disagreeing with the target and punished for the opposite behavior. The control group received neither positive nor negative reinforcement. The agreeing group showed a significant increase in leadership ranking, whereas the disagreeing group did not. It is suggested that the function of a group leader may be to maximize rewards for the group. —J. Rubin.

4519. Robins, George L. & Wexley, Kenneth N. (U Akron) **Modification through modeling and reinforcement in leaderless groups.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 87-91. —This study compared the effects of modeling plus reinforcement (MR), reinforcement alone (R), and demand characteristics (D) on individual verbal output in a leaderless group discussion. 24 like-sex triads of undergraduates were assigned to the 3 conditions and participated in 2 10-min discussions. Ss who spoke the least in the 1st discussion were chosen as target persons (TPs). TPs in the R condition were reinforced for talking and punished for silence. TPs in the MR condition received the same treatment but were also exposed to a leadership modeling film. TPs in the D condition received no reinforcement but were encouraged to become the group's leader. All conditions showed increases in verbal output, but the MR was significantly superior to both the R and D conditions. Results are interpreted as consistent with A. Bandura's (1969) mediational theory of modeling. *Journal abstract.*

(Graduate School & University Ctr, City U New York) **Race and modeling influences on the interpersonal play patterns of boys.** *Journal of Educational Psychology*, 1975(Oct), Vol 67(5), 591-598.—Studied the effects of race and modeling cues on the play patterns of dyads of young boys. 40 White and 38 Black 5th graders were observed during play on the basis of 5 indices of interaction. Black Ss talked significantly less together, faced each other less directly, and interacted at greater interpersonal distances than did White Ss. Racially mixed dyads were intermediate in social distance, talk, and body axis. Biracial dyads observed a televised episode of a Black male adolescent and a White male adolescent play together in a warm or cold fashion. Posttests revealed that Ss viewing the warm interaction were more cooperative, played at a closer distance, faced the other child more directly, gave more eye contact, and talked more frequently than did those who were exposed to the cold modeling videotape (20 ref) *Journal abstract*

Social Perception & Motivation

4533. Adler, Leonore L. & Graubert, Jean G. (Staten Island Community Coll, City U New York) **Projected social distances from mental patient related items by male and female volunteers and nonvolunteers.** *Psychological Reports*, 1975(Oct), Vol 37(2), 515-521.—Used a figure-placement procedure to measure projected social distances which 3 groups of undergraduates ($N = 179$) perceived between themselves several stimulus objects. Group 1 (Ss who were applying for a college volunteer program) placed themselves significantly closer to "mental patient," "retardate," and related stimuli than did the 2 nonvolunteering control groups. Although volunteers were similar to nonvolunteers, the critical difference between them was the projected distances they placed between themselves and "mental patient" and related stimuli. Dividing the data by sex showed that among nonvolunteers, males placed themselves significantly farther than females from "retardate," "mental patient," and to a lesser degree from "mental hospital." For the male nonvolunteers, stimulus items conveying a negative affect elicited greater projected social distances than did the responses to stimulus objects conveying a positive or neutral affect.—*Journal abstract*.
4534. Alcock, James E. (York U, Glendon Coll, Toronto, Canada) **Motivation in an asymmetric bargaining situation: A cross-cultural study.** *International Journal of Psychology*, 1975, Vol 10(1), 69-81.—Canadian and East Indian dyads played a temporally limited bargaining game with a 2×5 payoff matrix. Ss were 120 undergraduates. There were 3 experimental conditions: equality—each player had an equal range of possible payoffs; topdog—each player ostensibly had a larger payoff range than the other; and underdog—each player ostensibly had a smaller payoff range than the other. The actual range was identical across players and conditions. Canadians were more cooperative in the topdog than in the underdog condition, whereas for the Indians, there was evidence that the opposite was the case. Among the Indians in the underdog condition, a dominance-submission order apparently formed which may reflect the rigid social hierarchy in Indian society. (French summary) (16 ref)—*Journal abstract*.
4535. Arkin, Robert M. & Duval, Shelly. (U Southern California) **Focus of attention and causal attributions of actors and observers.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 427-438.—Tested the hypothesis that actors' and observers' causal attributions are a function of their focus of attention. Ss were 70 male and 44 female undergraduates. In the presence of observer-Ss, actor-Ss made a choice among several art works in a supposed decision-making study. Source of attribution (actors or observers), camera (actor videotaped or not videotaped), and situational stability (stable or dynamic environment) were manipulated. As predicted by the focus of attention-causal attribution notion, actors attributed more causality to the situation than

observers under normal circumstances, when the camera was not operative, but videotaping the actor reversed the usual actor-observer pattern such that actors attributed less causality to the situation than did observers. Further, when the environment was stable, actors attributed more causality to the situation in the no camera condition than in the camera condition, while observers attributed less to the situation in the no camera conditions than in the camera conditions. Additionally, both actors and observers attributed more causality to the situation when the environment was dynamic than when the environment was stable.—*Journal abstract.*

4538. Bowerman, William R. (U Kansas) **Projection: Perceptions of causal responsibility and relative worth.** *Psychological Reports*, 1975(Oct), Vol 37(2), 363-370.—A number of social psychological studies have found that Ss "project" negative personal characteristics onto similar, but not different, others. A wide variety of theoretical explanations have been offered to explain these data. In order to advance conceptual understanding of the forces responsible for projection, 2 processes which may be operative are proposed and distinguished: (a) *reference projection*—in which the S reduces his personal causal responsibility for a negative characteristic by believing that many others who are in his reference category share his fate, and (b) *comparison projection*—in which the S reduces the negativity of a characteristic by lowering the positions of others in his reference category, thereby raising his own relative position on the dimension. Factors which may influence the use of each technique are discussed, as is the connection between these processes and concepts from social comparison theory and attribution theory. (U Michigan) **What a person thinks upon learning he has chosen differently from others: Nice evidence for the persuasive-arguments explanation of choice shifts.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 412-426.—Administered 3 Choice-Dilemma Questionnaire items to 125-member groups of male undergraduates under 3 different conditions: Following their own choice they (a) learned what several others had chosen and then wrote arguments in support of alternatives given in that same item; (b) learned what several others had chosen and then wrote arguments in support of alternatives given in a different item; or (c) received

no information about others' choices but merely wrote arguments on that item. As predicted, shifts in choice occurred only if the S knew what others chose and had an opportunity to think about the latter; they did not occur if an opportunity to think of others' choices was denied, nor if knowledge of others' choices was withheld. Content analysis of the arguments Ss produced in conditions (a) and (b) supported the hypothesis, as did analyses of responses to postexperimental questionnaire which directly asked the Ss about their feelings and thoughts upon learning what others had chosen. (U Provence, Lab de Psychologie sociale, Aix-en-Provence, France) **[The PIP effect (Primus Inter Pares, first among equals) and norm conflict.]** (Fren) *Année Psychologique*, 1975, Vol 75(1), 127-145.—In 2 experiments, 52 students and 81 groups of 3 Ss each, respectively, undertook a decoding task involving collective or out the individualistic or competitive, behavior. According to the increased PIP effect, in social comparison processes the individual tends to present himself "more in the norms" of the situation than he presents his peers. However, norms are conflictful. Results of the experiments show that consideration by Ss of contradictory social norms is cognitively difficult, perhaps impossible. At any moment, reference can be made to only 1 consistent norm system. Hence, at a given moment, S can adopt only 1 superior conformity of self-behavior. When norms are changing, each one's self-comparison with others also changes, and the direction of the PIP effect is reversed. (16 ref) *Gi Rubin Rubinon*

4547. de La Haye, Anne-Marie. (CNRS, Lab de Psychologie sociale, U Paris VII, France) **[Research on anticipated interaction.]** (Fren) *Année Psychologique*, 1975, Vol 75(1), 153-167.—Studied research reports concerning anticipated interaction on perception of the "other person" and the processes influencing such perception. Consistently, the "other's" image is more favorable, and the effect of this influence is stronger when S expects to maintain a subsequent relation. This explanation, however, seems too simple in terms of unconsidered variables. Most often a cognitive union is determined by similarity and proximity, i.e., by a simple association which is hardly a social psychology. This orientation is criticized, and other research is cited to support an alternative opinion. Each type of influence

between partners produces varied consequences on the evolution of the relationships, which may be those of professional colleagues, sexual partners, fathers and sons, patients and physicians, or workers and employers. To assume common motivations is to produce deceptive and mystifying conclusions. (30 ref)—*G. Rubin-Rabson*.

4548. **Dion, Kenneth L. & Earn, Brian M.** (U Toronto, Canada) **The phenomenology of being a target of prejudice.** *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 944-950.—Studied the effects of perceived prejudice upon affect and self-evaluation by experimentally investigating the reactions of 48 Jewish male undergraduates to failure in an interpersonal situation. Ss attributing their failure to religious discrimination by Gentiles reported feeling more aggression, sadness, anxiety, and egotism on the Mood Adjective Check List than those who could not invoke anti-Semitism as an explanation for their failure. Moreover, they indicated less "social affection," particularly when one of the prejudiced opponents constituted the audience for their self-presentation. Finally, in response to perceived prejudice, Ss also evaluated themselves more favorably on positive traits underlying the Jewish stereotype. Findings are explained in terms of a stress interpretation.—*Journal abstract*.

4553. **Garske, John P.** (Ohio U) **Role variation as a determinant of attributed masculinity and femininity.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 31-37.—64 male and 63 female undergraduates attributed items from a sex-role stereotype questionnaire to 1 of 6 hypothetical stimulus persons who varied as a function of gender and role designation (adult, undergraduate, graduate student). Results hypothesized from previous studies of sex-role stereotypes and theoretical conceptions of the attribution process and social learning influences on personality were obtained: The adult stimuli yielded predictable sex-role stereotypy; the undergraduate stimuli produced no differential attributions, and the graduate student stimuli generated greater masculine attributions for the female. Results are interpreted in terms of the significance of situationally specific stimuli as determinants of attributions about men and women. (15 ref)—*Journal abstract*.

4554. **Greenwald, Anthony G.** (Ohio State U) **On the inconclusiveness of crucial cognitive tests of dissonance versus self-perception theories.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 490-499.—Several recent experiments are claimed to have tested conflicting predictions of cognitive dissonance and self-perception theories. It is argued that these claims fail to take into account the capacity of each formulation to account adequately for results "predicted" by the other. This argument is then continued, at a metatheoretical level, to reach the conclusion that the 2 theories are not capable of producing unequivocally contradictory predictions of cognitive consequences of experimental procedures.—*Journal abstract*.

Glen & Grady, Kathleen.** (Brooklyn Coll, City U New York) **Temporal delay, type of forewarning, and resistance to influence.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 459-469.—Previous researchers have manipulated forewarning by providing premessage information about the topic and position of the upcoming communication, or the communicator's persuasive intent. 154 undergraduates in the present experiment were forewarned either 10 min prior to the communication or just before the message began of the speaker's topic and position, persuasive intent, or topic only. As hypothesized, forewarning of the communicator's persuasive intent inhibited persuasion regardless of the length of the delay period, but forewarning of the topic and position required a delay in order to confer resistance to subsequent persuasion, suggesting that although both manipulations have been called "forewarning" they may lead to reduced persuasion through different mechanisms. Foreknowledge of the source's topic, but not his position also increased resistance to persuasion when followed by a delay period. Results are discussed in terms of both cognitive and motivational mechanisms that may underlie the persuasion inhibiting effects of forewarning.—*Journal abstract*.

H. Kelley's attribution theory of the way people perceive the causes of behavior. 81 undergraduates were given programs containing specially constructed information about the horses before each race and afterward completed a question-

naire indicating their perceptions about the horses' performance. As predicted, the performances of winning horses, as well as performances consistent in outcome with the horse's previous races were attributed more to the actor, the horse, and less to circumstances. Winning performances were less attributed to external factors (i.e., the field of horses). Significant, but relatively small, consistency by outcome interactions also were found.—*Journal abstract.*

4561. Kehoe, J. W. (U British Columbia, Vancouver, Canada) **Demonstrating the relationship between values and attitudes as a means of changing attitudes.** *Alberta Journal of Educational Research*, 1975(Sep), Vol 21(3), 207-212.—Tested the effectiveness of 2 related strategies for changing a measured disposition of intolerance toward cultural diversity to one of significantly less intolerance. Ss were 64 11th graders. The strategies were generated from 2 sources: (a) dissonance theory of changing attitudes which suggests that if enough dissatisfaction with behavior or beliefs exists, then change in the behavior or beliefs will take place; and (b) M. Rokeach's (1967, 1968) formulation that measured values are more central components of a person's make-up than measured attitudes, and values determine attitude. The 1st treatment attempted to determine whether a manipulated change in the relative position of 3 measured values related to tolerance (equality, freedom, and broadmindedness) would change the measured attitudes of Ss toward culturally diverse groups. The 2nd treatment included the above sources of manipulated change and, in addition, demonstrated inconsistencies between ranks of the 3 relevant values and scores on the attitude scale. The 2nd treatment was successful in changing attitudes.—*Journal abstract.*

4562. Koomen, Willem & Mesman Schultz, Kees. (U Amsterdam, Psychologisch Lab, Netherlands) **[Analysis of preference-judgment and sex differences in the use of dimensions.]** (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1975(Aug), Vol 30(6), 515-524.—Compares the technique of principal components of the rank orders of preferences of stimuli with J. B. Kruskal's (see PA, Vol 39:145, and Vol 39:3167) multidimensional scaling technique of the similarity of judgments. The stimuli were 12 constructed descriptions of students that varied on the dimensions of (a) sociability, (b) emotionality, (c) trustworthiness, and (d) intelligence. Ss were a total of 82 male and female psychology students below CA 30. Kruskal's analysis revealed all 4 dimensions, but sociability was not found in the components analysis. Analyses of variance between the sex differences of perceivers of stimuli according to the components rank order scores indicated that intelligence was considered to be more desirable for male than for female stimuli. Female perceivers considered intelligence more desirable than did the male perceivers. (16 ref)—*A. J. Ter Keurst.*

4564. Kruglanski, Arie W. (Tel-Aviv U, Israel) **The endogenous-exogenous partition in attribution theory.** *Psychological Review*, 1975(Nov), Vol 82(6), 387-406.—Describes a theoretical framework whereby the ac-

tion's endogenous attribution is linked with the inferences of intrinsic motivation, subjective freedom, and the action's underlying intention. The endogenous-exogenous distinction is proposed to replace the frequently invoked partition between the action's internal and external causes. Both conceptual and empirical considerations are put forth in favor of such a replacement. Classical attribution topics to which the internal-external partition has been applied are reinterpreted in terms of the endogenous-exogenous distinction, and novel data are reported that support the latter framework. Finally, several categories of conditions for endogenous (or exogenous) attributions are identified, and possible directions of further research within the endogenous-exogenous framework are suggested.—*Journal abstract.*

4565. Kuhlman, D. Michael & Marshello, Alfred F. (U Delaware) **Individual differences in game motivation as moderators of preprogrammed strategy effects in prisoner's dilemma.** *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 922-931.—Examined the impact of 3 programed strategies (tit-for-tat, 100% cooperation, and 100% defection) on cooperation level in the prisoner's dilemma game as a function of the S's motivational orientation (cooperative, competitive, or individualistic). Motivational orientation was assessed on the basis of each S's choices across four classes of decomposed games. Following this assessment, Ss played 30 trials of prisoner's dilemma in matrix form against one of the above-mentioned strategies. Ss were 167 undergraduates. Results show that (a) cooperatively oriented Ss cooperated with a tit-for-tat and a 100% cooperative strategy, but defected against a 100% defecting strategy; (b) competitive Ss defected against all 3 strategies; and (c) individualistic Ss defected against both 100% cooperative and 100% defective strategies, but they cooperated with a tit-for-tat strategy. It is concluded that the outcomes of a prisoner's dilemma have affectively different meanings (i.e., values) for Ss of differing orientations, and that Ss of all 3 orientations adopt strategies that effectively maximize their particular type of reward in the game.—*Journal abstract.*

4566. Larwood, Laurie & Legault, Jeanne. (State U New York, Binghamton) **In defense of psychological territory.** *Psychological Reports*, 1975(Oct), Vol 37(2), 421-422.—128 college students won or lost to a confederate on sex-appropriate or inappropriate tasks. Sex of confederate, sex of S, and sex of E were also varied factorially. Defense of intellectual territory was operationalized as shock administered to the confederate in an aggression paradigm following loss at a sex-appropriate task. The concept received support for for male Ss having male Es. An association of masculinity with the differentiation of aggressive response was also noted.—*Journal abstract.*

4568. Masterson, Stephen P. (George Mason U) **Sex and the perception of imaginary individuals.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 121-126.—Investigated the effect of the E's sex upon Ss' characterizations of an imaginary individual. 43 male and 24 female undergraduates were divided into 2 groups, with a female E

assigned to one group and a male E to the other. The experimental procedure was held constant for both groups, with the independent variable being the sex of the E. It was found that when the Ss were told to rate an imaginary individual, the sex of the E had a significant effect on the Ss' tendency to rate their imaginary individual as "humorous." Moreover, the extent to which the Ss rated their imaginary individuals as "honest," "warm," "good-natured," "strong" and "persistent" varied significantly when the sex of the Es and Ss was varied systematically. Findings indicate that the sex of an E influences in predictable ways the Ss' characterizations of individuals that they have not met and can only imagine. Such effects may be a hidden source of variance in certain experimental and clinical measurements.—*Journal abstract.*

4569. Nisbett, Richard E. & Borgida, Eugene. (U Michigan, Inst for Social Research) **Attribution and the psychology of prediction.** *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 932-943.—Described 2 previously conducted psychology experiments to a total of 128 male undergraduates in 2 experiments. Some Ss were told about the actual distribution of behavior in the experiments, and others were not. Knowledge of the distributions did not influence Ss' attributions about the causes of the behavior of original participants nor their predictions about what their own behavior might be. As expected, base rate information did not even affect Ss' guesses about the behavior of particular target members of the original experimental populations. It is concluded that Ss ignore base rates for behavior just as they ignore base rates for category membership.—*Journal abstract.*

(U Missouri, Columbia) **The effects of a model's behavior, the perceived arousal of the model, and false physiological feedback about the subject's own level of arousal on instrumental aggression, physiological arousal, and person perception.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1299.

4572. Saltzstein, Herbert D. & Sandberg, Louis. (Herbert H. Lehman Coll, City U New York) **The relative effectiveness of direct and indirect persuasion.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 39-48.—93 undergraduates were required to impose sentences in 2 criminal cases. Experimental Ss gave their sentences in the 1st case before and after reading a judge's (harsh) sentence. The difference between the 2 sentences was the measure of direct influence. No significant direct influence effect was noted, in comparison to a control group. The difference between the 1st sentence imposed in each of the cases was the measure of indirect influence. In one condition Ss anticipated seeing the judge's sentence in the 2nd case; in the other condition Ss did not anticipate seeing the judge's sentence. In comparison to the control group, indirect influence was significant ($p < .025$) in the anticipation condition, but not in the no-anticipation condition. Indirect influence in the anticipation condition, without direct influence, is interpreted as reflecting a social strategy for avoiding the

appearance of influencibility in the 1st case and avoiding discrepancy from the influence agent in the 2nd case.—*Journal abstract.*

4575. Sorrentino, Richard M. & Boutillier, Robert G. (U Western Ontario, London, Canada) **The effect of quantity and quality of verbal interaction on ratings of leadership ability.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 403-411.—16 4-member groups of male undergraduates engaged in a problem-solving situation in which the goal was to maximize gains and minimize losses in a matrix game. One member of each group, a trained confederate, independently varied his quantity and quality of verbal interaction to determine their importance in determining leadership emergence. While quality of verbal interaction predicted perceived differences on such variables as competence, influence, and contribution to the group's goal, only quantity of verbal interaction predicted perceived differences in leadership ability. Data suggest that this paradox may be due to quantity being a clearer indication of a group member's intentions than quality. (21 ref)—*Journal abstract.*

4576. Steffensmeier, Renée H. & Steffensmeier, Darrell J. (Pennsylvania State U) **Attitudes and behavior toward hippies: A field experiment accompanied by home interviews.** *Sociological Quarterly*, 1975(Sum), Vol 16(3), 393-400.—Hypothesized that Ss who exhibit high social distance toward a hippie target will be more likely to report a hippie shoplifter than Ss low on social distance. The relationship between social distance and the severity of reaction to deviance and the extent of congruence between verbal scale scores and overt actions were studied in a field study and a home interview with 68 Ss. The hypothesis was tested using observational data collected during a field experiment in which rigged shoplifting events were enacted and self-report data collected during follow-up interviews. Data support the hypothesis and strengthen the idea of the congruence of attitudes and behavior. (26 ref)—*Journal abstract.*

4579. Trope, Yaacov & Burnstein, Eugene. (Hebrew U, Jerusalem, Israel) **Processing the information contained in another's behavior.** *Journal of Experimental Social Psychology*, 1975(Sep), Vol 11(5), 439-458.—Investigated attributions based on behavior congruent with

situational demands (in-role) and those based on behavior incongruent with situational demands (out-of-role). By analyzing these processes in terms of a Bayesian inference model, it was possible to determine (a) the diagnostic values observers initially assign to behaviors, (b) the actual informational impact of these behaviors, and (c) the degree of optimality in processing information contained therein. Data from 170 undergraduates show that (a) the diagnostic value and actual informational impact of out-of-role behaviors were much higher than those of in-role behaviors; (b) information about out-of-role behaviors was less optimally processed than information about in-role behaviors; (c) observers assigned smaller diagnostic values to behaviors which were described in great detail than to behaviors which were described in summary statements; (d) observers' attitudes influenced their initial beliefs about the actors but not the processing of new information about the actor; and (e) the Bayesian inference model predicted observers' inferences reasonably well. (19 ref)—*Journal abstract*.

4580. Turner, Barbara F. & Turner, Castellano B. (U Massachusetts, Amherst) Race, sex, and perception of the occupational opportunity structure among college students. *Sociological Quarterly*, 1975(Sum), Vol 16(3), 345-360.—Administered questionnaires to 70 Black female, 75 Black male, 1,457 White female and 1,429 White male college freshmen. To test 3 alternative theories regarding perceptions of discrimination, analyses of variance related sex, race, and socioeconomic status (SES) to total scores of perceived occupational discrimination against Blacks (BDST) and against women (WDST). Blacks perceived significantly more discrimination against Black people than did Whites; neither sex nor SES differentiated scores on BDST. Black females and White males perceived significantly more discrimination against women than did White females; Black females had the highest and White females the lowest WDST scores. A discriminant analysis on White females indicated that high WDST scorers were characterized by an "underdog syndrome" whereas low WDST scorers held internal, individualistic values. Findings indicate the greatest support for the formulation that differential anticipatory socialization into the role of "a person who is discriminated against" characterized White females who perceived more or less discrimination against women. 4581. Waldo, Jane Y. (Ohio State U) Cognitive complexity and interpersonal perception: A content analysis of college students' commonsense personality descriptions, with emphasis on interpersonal sensitivity. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 865.

4582. Wegner, Daniel M. & Crano, William D. (Trinity U) Racial factors in helping behavior: An unobtrusive field experiment. *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 901-905.—Conducted a naturalistic study on race and sex differences in aiding behavior. The complete crossing of sex and race of 144 Black and White undergraduate Ss and of confederates in a nonthreat situation on a university campus revealed that Black bystanders helped more Black than White victims, whereas White bystanders

helped both races equally. 2 possible integrations of these results with previous, contradictory results are presented: (a) Black college students may be more cohesive than Black city residents or (b) Black individuals may be more likely to aim their altruistic activities at other Blacks when the immediate population is predominantly White than when it is predominantly Black. Some significant interactions involving sex and race were also observed.

4584. Wolf, Charlotte. (Ohio Wesleyan U) Group perspective formation and strategies of identity in a post-threat situation. *Sociological Quarterly*, 1975(Sum), Vol 16(3), 401-414.—Presents a microsociological study of a group of people who have undergone a threat experience (residents of a small summer-cottage housing area who were faced with the possibility of a disastrous fire). Within the combined theoretical frameworks of symbolic interactionism and phenomenology, the event is viewed as a "reality shock" for its participants, involving cognitive crises in group and individual definitions of the situation. The after period is one in which procedures toward making the threat experience meaningful on both group and individual levels are instituted within group networks. These procedures on a group level involve the construction of a "real" event by the objectification of time and experience and through the emergence and attribution of post-hoc norms. Strategies toward the maintenance and continuity of identity include reconstruction of the threat situation, of other participants' behavior, of post-hoc norms of individual behavior, and the negotiation of identity on these various bases. PERSONALITY

4586. Adcock, Ngaithe V. (Victoria U Wellington, New Zealand) Early memories and sex differences. *New Zealand Psychologist*, 1975(Apr), Vol 4(1), 30-34.—Following a lecture on Adlerian theory, a class of Psychology I students were asked to record their earliest memory. Reports were received from 126 females and 100 males and were analyzed according to the major theme involved and according to 8 categories that related to emotional content. 80 specific themes were found but some categories which were infrequently used were combined where appropriate, giving a total of 11 categories. An analysis of the reports showed that males reported significantly more memories relating to "games and parties" and "accidents to self" whereas females reported significantly more memories relating to "interactions" "helping experiences" and "sexual experiences" in that order. More males reported "pleasurable experiences" and the females more "frightening experiences".

on "neutral report," both at the 0.01 level of significance. (20 ref)—*Journal abstract*.

4587. Ashton, Vicki L. & Dwyer, James H. (U California, Langley-Porter Inst of Neuropsychiatry, San Francisco) **The left: Lateral eye movements and ideology. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 248-250.**—Videotaped the lateral eye movements of 24 college students as they reflected on spatial and analytical questions. As predicted, participants with more initial movements to the left had significantly higher scores on the leftist (or humanistic) index of the Tomkins Polarity Scale. The direction of this relationship was reversed for the rightist index (right movers scoring higher), but this difference was not significant. Results are interpreted as additions to evidence which suggests a connection between the left and right sides of the human body and more global dichotomies of ideology or personality.—*Journal abstract*.

4588. Bailey, Roger C.; Zinser, Otto & Edgar, Ralph. (East Tennessee State U) **Perceived intelligence, motivation, and achievement in male and female college students. *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 125-129.** Administered a self-rating scale which allowed self- and typical-student estimates of intelligence, motivation, and achievement, to 55 male and 38 female undergraduates. Males and females gave similar self-estimates of intelligence, although compared to males, females rated their motivation and achievement higher. Both males and females regarded the typical female student as more intelligent, more motivated, and more academically successful than the typical male student. A sex difference was observed on self- vs typical-student-of-the-same-sex ratings. On non-college-related personality dimensions, both males and females continued to share an unfavorable female stereotype.—*Journal abstract*.

4589. Barrell, Gerald V. & Trippe, Helen R. (U Southampton, England) **Field dependence and physical ability. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 216-218.** Measured field-dependence scores of professional dancers, highly skilled performers in tennis, soccer, cricket, and track and field athletics, medium-ability players in the same 4 sports, and a group of nongame players, using a rod-and-frame test. Results show that highly skilled tennis players were significantly more field-dependent than top-class track and field athletes and medium-ability tennis players.—*Journal abstract*.

4592. Bascue, Loy O. (U Maryland) **A study of the relationship of time orientation and time attitudes to death anxiety in elderly people. *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 866-867.**

4593. Becker, Robert E.; Cohen, Ronald J. & Teevan, Richard C. (State U New York, Albany) **Hostile press and a survey of fears. *Psychological Reports*, 1975(Oct),**

Vol 37(2), 463-466.—Following the idea of R. C. Birney et al (1969) that the Hostile Press measure of fear of failure has to do with a fear of being a failure in the eyes of others, a correlational analysis of the relationships between Hostile Press and the Fear Survey Schedule was undertaken with approximately 200 undergraduates. It was predicted that Hostile Press would correlate with those fears which had to do with failing in the eyes of others and not with any other kinds of fears. It is suggested that the results bear out the hypothesis.—*Journal abstract*.

4594. Bennett, David H. & Holmes, David S. (U Kansas) **Influence of denial (situation redefinition) and projection on anxiety associated with threat to self-esteem. *Journal of Personality & Social Psychology*, 1975(Nov), Vol 32(5), 915-921.**—In a study with 112 female undergraduates, Ss in a threat condition were informed that they had failed an important test while Ss in a nonthreat condition were not told that they had failed. To manipulate the use and timing of coping strategies for dealing with threat, Ss were told to (a) redefine the nature and importance of the test before receiving feedback, (b) redefine the nature and importance of the test after feedback, or (c) estimate the performance of their friends on the test (i.e., project) after receiving feedback. Repeated measures of subjective anxiety (State-Trait Anxiety Inventory) and pulse rate indicated that (a) the threat manipulation was effective in increasing stress, (b) redefinition occurring after the onset of threat was ineffective in reducing stress. Projection reduced the report of subjective anxiety. (19 ref)—*Journal abstract*.

4595. Booth, Anthony. **Drawing status and picture preferences of primary school children. *Educational Studies*, 1975(Mar), Vol 1(1), 63-76.**—Examined the preferences of 2 groups of children (mean ages, 7 and 11 yrs) for adult pictures. The status of the children's drawings of a man was established by rating them on the Draw-A-Man point scale. The same scale was used to rate adult pictures of the same S. These were then placed in a 5-interval scale and offered in random arrays in a choice activity. Ss from all status levels chose adult pictures as superior to their own drawing products. A significant relationship was established between preference and status on this dimension. A factor analysis of other picture dimensions and Ss' characteristics did not reveal any serious alternative contributory factors to the preferences shown. (31 ref)—*Journal summary*.

4596. Burdsal, Charles. (Wichita State U) **An examination of second order motivational factors as found in adults. *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 83-89.**—Administered the Motivational Analysis Test, which measures 10 dynamic structures, to 247 undergraduates and US Air Force personnel. 6 general motivational factors were found: long-term growth and satisfaction vs short-term attainments with frustrations, social vs selfish values, masculinity vs femininity, people orientation, egocentric vs materialistic orientation, relaxed materialism vs frustrated insecurity. It is suggested that these factors represent an individual's general motivational orientation.—*Journal abstract*.

4597. Burnett, Darrell J. (United States International U) **Dogmatism, cognitive complexity, and trait anxiety:**

- A study of interrelationships.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1740-1741.
4598. Chabassol, David J. & Thomas, David. (U Victoria, Canada) **Needs for structure, tolerance of ambiguity and dogmatism in adolescents.** *Psychological Reports*, 1975(Oct), Vol 37(2), 507-510.—Administered the Chabassol Adolescent Structure Inventory, A. P. MacDonald's Ambiguity Tolerance Scale, and the Rokeach Dogmatism Scale to 400 urban 8th-11th graders. Structure need scores were significantly and negatively correlated with scores of ambiguity tolerance, and significantly and positively correlated with scores of dogmatism (r s from 0.32 to -0.45). Dogmatism and ambiguity tolerance scores were negatively correlated, as anticipated from MacDonald's work (see PA, Vol 45:708). Findings are taken as evidence of construct validity for the structure inventory.—*Journal abstract*.
4599. Christian, Kenneth W. (U California, Davis) **A method of assessing self-esteem through numerical self-reports.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 869-870.
4600. Cohen, Ronald J. & Teevan, Richard C. (State U New York, Albany) **Philosophies of human nature and hostile press.** *Psychological Reports*, 1975(Oct), Vol 37(2), 460-462.—64 male undergraduates took the R. C. Birney et al Hostile Press measure of fear of failure and the Philosophies of Human Nature Test. It was predicted that persons high on Hostile Press would perceive the world as a hostile place and thus would have a generally less favorable view of human nature—would score low on the Philosophies of Human Nature Test. In general, the data bore out the hypothesis, although the authors felt that the results on Independence did not fit previous research and theory as to the conforming behaviors of persons high in Hostile Press.—*Journal abstract*.
4601. Cohen, Ronald J.; Becker, Robert E. & Teevan, Richard C. (State U New York, Albany) **Perceived somatic reactions to stress and hostile press.** *Psychological Reports*, 1975(Oct), Vol 37(2), 676-678.—Investigated evidence that people high on Hostile Press see the world as a hostile, threatening place and hypothesized that persons high on Hostile Press should show psychophysiological reactions to their feelings about the world. 101 male undergraduates were given the Hostile Press measure (R. C. Birney et al) of fear of failure and a reactions-to-stress questionnaire. The prediction was that there would be a positive correlation between the 2 measures. In general, the prediction was confirmed.—*Journal abstract*.

4603. Crummer, Mary L. (U Florida) **Sex-role identification, "motive to avoid success," and competitive performance in college women.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 408.
4604. Dixon, Paul W.; Roper, Roy E. & Ahern, Elsie H. (U Hawaii, Hilo Coll, Hawaii) **Comparison of rural and urban high school students in Japan using EPPS.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 63-71.—Assessed sociospa-
- tial effects on personality in 581 urban, suburban, and rural Japanese high school students. The Japanese version of the Edwards Personal Preference Schedule was used to detect changes in personality need structures. A further comparison was made between 141 *sansei* (3rd generation Japanese) and cosmopolitan (mixture of more than 1 ethnic group) rural high school students in Hawaii and the Japanese samples. Results support the hypothesis that an urban environment fosters greater need for achievement and independence, including an increased need for heterosexuality and change in private boys' schools in an urban area. Rural environments produced less elevated need patterns, probably because of increased ease of need satisfaction. (16 ref)—*Journal abstract*.

4610. Garcia, Claudia & Levenson, Hanna. (Texas A&M U) **Differences between Blacks' and Whites' expectations of control by chance and powerful others.** *Psychological Reports*, 1975(Oct), Vol 37(2), 563-566.—110 Black and 84 White college students completed H. Levenson's Internal, Powerful Others, and Chance locus of control scales. Findings indicate that Ss from low-income families had significantly stronger perceptions that their lives were controlled by chance forces than did wealthier students. Analyses of covariance controlling for level of socioeconomic status showed that Blacks scored significantly higher than Whites in their perception of control by powerful others and chance forces.—*Journal abstract*.
4611. Gjesme, Torggrim. (U Oslo, Inst for Educational Research, Norway) **Slope of gradients for performance as a function of achievement motive, goal distance in time, and future time orientation.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 143-160. It was predicted that (a) individuals high in motivation to approach success and low in motivation to avoid failure (approach-oriented) would increase their performance and (b) those with the opposite motivation constellation (avoidance-oriented) would decrease their amount of performance as a distant

future achievement task (goal) approached in time. Further, it was assumed that individuals high in future time orientation (FTO) would perceive a distant future event (goal) as nearer in time than those low in FTO. This implies the hypotheses that (c) the slope of the positive goal gradient would be steeper for those of the approach-oriented individuals low in FTO as compared with those high in FTO, and (d) the slope of the negative goal gradient would be steeper for those of the avoidance-oriented individuals low in FTO as compared with those high in FTO. Results, based on 379 12-yr-olds, support hypotheses (a) and (d) and provide partial support for hypotheses (b) and (c). (33 ref)—*Journal abstract*.

4612. Gorman, John R. (Loyola U, Chicago) **Adjustment and self disclosing behavior of Roman Catholic priests.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 413.

4613. Hannah, T. Edward; Hannah, Ellen R. & Wattie, Barbara. (Memorial U Newfoundland, St John's, Canada) **Arousal of psychological reactance as a consequence of predicting an individual's behavior.** *Psychological Reports*, 1975(Oct), Vol 37(2), 411-420. —Predicted 72 paid undergraduates' aesthetic choices on the basis of a "personality test" described as being either 58, 68 or 78% accurate. Results are consistent with the notion that such prediction would be perceived as a threat to behavioral freedom and result in the arousal of psychological reactance. Ss who were led to believe that the test was fairly accurate in predicting choices, as compared to those who thought their choices to be minimally predictable, were both more likely to choose the opposite of what was predicted and to change their ratings such that the predicted choice was devalued and the nonpredicted choice revalued upwards. Results may have important implications for a situation in which either implicit or explicit predictions of an individual's behavior are made. (22 ref)—*Journal abstract*.

4614. Hill, David. (U Liverpool, Inst of Education, England) **Personality factors amongst adolescents in minority ethnic groups.** *Educational Studies*, 1975(Mar), Vol 1(1), 43-54. —Obtained scores on the Junior Eysenck Personality Inventory for 700 English, West Indian, Indian boys and girls and Pakistani boys, 100 in each group, age 14-16 yrs, randomly selected from 14 secondary schools. Reading ability, social class, and length of stay were controlled. Significant differences were found between ethnic groups on all 3 variables (Extraversion, Neuroticism and Lie scales). Possible interpretations of these findings in relation to the integration and assimilation of minority ethnic groups are discussed.—*Journal summary*.

4615. Hoffnung, Robert A. (Fordham U) **Patterns and relations of personality and dogmatism among selected groups of Orthodox Jews.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 394.

4617. Johnson, Miriam M.; Stockard, Jean; Acker, Joan & Naffziger, Claudene. (U Oregon) **Expressiveness reevaluated.** *School Review*, 1975(Aug), Vol 83(4),

617-644. —400 male and female college students were asked to rate themselves on 46 adjectives, selected from Gough's Adjective Check List and sorted into the following 6 categories: positive expressive, negative expressive, positive instrumental, negative instrumental, active and/or independent, and passive and/or dependent (with a residual category for words that could not be placed in any of the 6). The women rated themselves as both more positive expressive and less negative expressive than men. The only other significant difference was a tendency for men to rate themselves as more analytical, rational, and foresighted than women rated themselves. There was no difference between men's and women's self-ratings on dependency or on negative instrumental traits. It is concluded that the concept of positive expressiveness can be used to express feminine virtues without involving a derogatory view of women. The instrumental-expressive distinction thus provides social scientists with a theoretically useful and empirically valid distinction between the sexes. (34 ref)—C. K. Miller.

4618. Kaiser, Donn L. (Southeast Missouri State U) **Internal-external control and causal attributions of own and others' performance.** *Psychological Reports*, 1975(Oct), Vol 37(2), 423-426. —In a 3 x 3 factorial design, 69 undergraduates with a high, medium, or low perceived internal control on Rotter's Internal-External Control Scale (I-E Scale) judged the degree to which they thought 3 grades on a classroom examination resulted from effort and ability (internal factors) as opposed to type of test and luck (external factors). The 3 grades were the Ss' own grade, the highest grade in class, and the lowest grade in class. Results show that Ss with a high degree of internal control on the I-E Scale attributed all 3 grades to internal factors significantly more than Ss with a low degree of internal control. Internal attributions were significantly higher for the highest grade in class than for the others.—*Journal abstract*.

4619. Kaplan, Howard B. (Texas Medical Ctr, Baylor Coll of Medicine, Houston) **The self-esteem motive and change in self-attitudes.** *Journal of Nervous & Mental Disease*, 1975(Oct), Vol 161(4), 265-275. —Tested 2 hypotheses derived from a theoretical review of the self-esteem motive, using questionnaire data from 3,148 junior high school students collected annually at 3 points in time. It was hypothesized and found that (a) mean self-derogation scores (measured by a revised version of the Rosenberg Self-Esteem Scale) would decrease significantly over time and (b) individuals with initially more negative self-attitudes relative to those with initially more positive self-attitudes would display significantly greater decreases in self-derogation over time. Findings support the prevalence of the self-esteem motive. Results are discussed with regard to the literature on developmental disturbances in self-image, differential vulnerability to self-devaluing experiences, and the relationship between change in, and level of, self-acceptance. (40 ref)—*Journal abstract*.

4624. **Leeb, Stephen.** (New York U) **Empirical application of a cognitive framework to rigidity, aspects of creativity, anxiety, and adjustment.** *Psychological Reports*, 1975(Oct), Vol 37(2), 651-668.—Argues that psychology should be based on constructs independent of objective environmental meaning. 4 such constructs are introduced and related to various measures of personality variables. In tests with 88 undergraduates, subjective anxiety and adjustment, as measured by the Maudsley Personality Inventory and D. Byrne's Repression-Sensitization scale, were associated with a type of consistency which is based on the number of choices an individual has for finding relationships with respect to available subjective information. Personality rigidity, as measured by the Rokeach Dogmatism Scale and the Authoritarianism scale of T. W. Adorno et al, was negatively associated with the amount of subjective information available as well as how the information was grouped. Creativity, as measured by the Remote Associates Test, was positively associated with the amount of subjective information. The defense mechanisms, repression and sensitization, were associated with synthetic and analytic groupings of information, respectively. Contrary to past studies, evidence is given that high dogmatism may be systematically associated with either repression or sensitization. (22 ref)—*Journal abstract.*

4625. **Lerner, Richard M. & Iwawaki, Saburo.** (Eastern Michigan U) **Cross-cultural analyses of body-behavior relations: II. Factor structure of body build stereotypes of Japanese and American adolescents.** *Psychologia: An International Journal of Psychology in the Orient*, 1975(Jun), Vol 18(2), 83-91. 90 male and 90 female Japanese junior high school students attributed 56 verbal checklist items to stimulus pictures of a male endomorph, mesomorph, and ectomorph. The attitudinal factor structure of the 2 sex groups was markedly similar, and with both groups a positive mesomorph factor and negative endomorph and ectomorph factors were found. These Japanese adolescent factor structures were compared to corresponding data obtained by R. M. Lerner and S. J. Korn (1972) with American adolescent males. Intercultural continuity is evidenced by similar evaluative valences being associated with corresponding body build factors, and by high intercultural factor congruence coefficients. However, there is evidence for intracultural disparity between these Japanese adolescent data and previous studies of the body build stereotypes of Japanese adults. Possible sources of these differences are suggested, along with empirical ways to substantiate these suggestions.—*Journal abstract.*

4626. **Leverenz, David.** (Rutgers State U, Livingston Coll. North Brunswick) **Anger and individualism.** *Psychoanalytic Review*, 1975(Fal), Vol 62(3), 407-428. Argues that withdrawal from relationships which are felt to

be too dangerous to enter into is, in adult form, individualism. The psychological consequences of a 19th-century individualism that has persisted into 20th-century life are examined. The mixture of narcissism and paranoid fatalism which is central to American literature is especially intense in the writings of Emerson, Thoreau, Melville, and Mailer. The way in which these writers reinforce the reader's own individualism is examined. In reading, as in life, experiences which segregate both assertion and dependency feel comfortable.—G. S. Speer.

4628. **Lombardo, John P. & Berzonsky, Michael D.** (State University Coll New York, Cortland) **Locus of reinforcement control, self-image disparity, and self-acceptance: A replication.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 147-148.—Attempted to replicate findings of J. P. Lombardo et al (1975) which suggest a relationship between external locus of control and personality maladjustment. Data from 60 internal and external undergraduates replicate the Lombardo et al findings and show that externals were less self-accepting than internals on 2 measures of self-acceptance. No sex differences were found.

4629. **Loreto, D. & Tonoli, C.** (Hosp Psichiatrico Provinciale, Como, Italy) **[A study of the relationship between frustration and aggression.]** (Ital) *Neuropsichiatria*, 1973(Jan-Jun), Vol 29(1-2), 43-57.—Tested the hypothesis that frustration leads to aggressive IAT fantasies in a group of 30 female college students 18-20 yrs old. Based on teachers' ratings, 3 subgroups equated for initial hostility level were formed. The frustration for Group 1 consisted of a simple interruption of a task (Kohs Cubes) after 5 min; for Group 2 the task was also presented as an intelligence test which most Ss could complete in the allotted time. Controls were not given the Kohs Cubes. 8 IAT cards were then individually administered and stories scored for aggressive content according to Stone's scoring system. Significantly higher aggressive scores were noted in Group 2, but no differences were noted between Group 1 and controls. Other responses to frustration (repression, fixation) are discussed. Factors such as the stimulus situation and the variability of the character of the individuals are considered important in the genesis of aggressive behavior besides frustration (35 ref) (English, French, & German summaries)—A. Felice.

4634. Mukherjee, Bishwa N. (Council for Social Development, New Delhi, India) **A questionnaire measure of persistence disposition.** *Indian Journal of Psychology*, 1974, Vol 49(4), 263-278.—Developed a true-false persistent-disposition questionnaire (PDQ) using a combination of intuitive and internal strategies of test construction. A factor analysis and a scalogram analysis based on the responses of 365 high school students and undergraduates provided evidence for factorial validity of the 20-item inventory. The different reliability estimates appear satisfactory. The inventory correlated highly with C. K. Wang's persistence questionnaire and a forced-choice measure of achievement values. School grades also were significantly correlated with PDQ scores. (27 ref)—*Journal abstract.*
4635. Murgatroyd, Dorothy & Gavurin, Edward I. (Herbert H. Lehman Coll, City U New York) **Comparison of Edwards Personal Preference Schedule norms with recent college samples.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 71-76.—Comparisons of the 15 major needs assessed by the EPPS were made between the original manual norms for college men and women published in 1959 and urban college men and women studied in 1973, between the means for Roman Catholic sisters published by H. W. Gardiner in 1973 and urban college women studied in 1973, between urban college men and women studied in 1973, and between urban college men and women studied in 1969 and urban college men and women studied in 1973. The major trends noted in the data were (a) a shift in the expressed needs of the sexes so that they were more nearly alike and (b) a similarity in the patterns of need changes for the sexes. It is suggested that these changes may be attributed to societal changes in the past decade.—*Journal abstract.*
4636. O'Neil, Harold F.; Teague, Mary; Lushene, Robert E. & Davenport, Sue. (U Texas, Austin) **Personality characteristics of women's liberation activists as measured by the MMPI.** *Psychological Reports*, 1975(Oct), Vol 37(2), 355-361.—Explored the validity of notions held by the women's liberation movement regarding personality characteristics of movement activists. 2 groups, one composed of 19 female college student activists in the women's liberation movement and the other composed of 34 female college students, were given a computer-administered MMPI. Results do not support the imputations that college student activists in the women's liberation movement exhibit deviant personality characteristics or that they are more maladjusted than control Ss. *Journal abstract.*

4650. Sharma, K. N. (Aligarh Muslim U, India) Creativity as a function of intelligence, fine arts interest and culture. *Indian Journal of Psychology*, 1974, Vol 49(4), 313-319.—In a study with 414 male urban and rural 10th graders, creativity was measured by 2 author-constructed tests, intelligence was measured by the Samoohika Mansik Yogyata Pariksha, and fine arts was measured by a subtest from Chatterji's Non-language Preference Record (Form 962). Creativity was positively affected by the 3 variables and their interactions, except for the interaction of fine arts with culture. A high level of intelligence is considered necessary for the development of creative thinking. The importance of a rural environment in promoting creativity is explained by its being less directive, allowing rural inhabitants a freer interplay of thoughts and ideas. The urban environment is considered oppressive. (22 ref)—*Journal abstract*.

4658. Wallbrown, Jane D. & Wallbrown, Fred H. (Worthington Public Schools, OH) Further evidence concerning the validity of Kagan's comments on the clinical interpretation of the Bender Gestalt. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 51-54.—The validity of J. Kagan's (1965) hypothesis regarding the involvement of impulsivity in the reproduction of Bender-Gestalt drawings was examined for 76 1st graders from a suburban school. The correlation between errors as described by E. Koppitz (1964) on the Bender and impulsivity as defined by mean latency on the Matching Familiar Figures Test was $-.31$ ($p < .01$), but the value of r decreased to only $-.23$ when IQ was partialled out. Findings did not support Kagan's hypothesis since latency for matching accounted for only 5% of the variance in Bender errors. That is, Koppitz errors on the Bender showed almost, if not complete, discriminant validity from impulsivity as defined by latency for matching figures. The r between Bender errors and total working time on the Bender itself was negligible, indicating that Koppitz errors cannot be explained in terms of impulsivity as defined by inadequate working time.—*Journal abstract*.

4660. Wexley, Kenneth N.; McLaughlin, Janet L. & Sterns, Harvey L. (U Akron) A study of perceived need fulfillment and life satisfaction before and after retirement. *Journal of Vocational Behavior*, 1975(Aug), Vol 7(1), 81-87.—Examined the perceived need satisfaction, need importance, and overall life satisfaction of 155 managerial and nonmanagerial individuals as a function of 4 periods of proximity to retirement: greater than 48 mo preretirement, 3-48 mo preretirement, 3-48 mo postretirement, and greater than 48 mo postretirement. Preretirees and retirees completed a modified Porter Need Satisfaction Questionnaire and the Life Satisfaction Index. Significant differences were found among proximity to retirement groups in security satisfaction, being-in-the-know satisfaction, self-actualization importance, and autonomy importance. Results suggest that the period of 4-7 yrs before retirement may be a critical time to institute retirement planning programs. Results also suggest that retirement can be a satisfying period of life.—*Journal abstract*.
4661. White, William F. & Anderson, Joy. (U Georgia) Personality differences among female student teachers

of relatively high and low mental ability. *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 29-30.—30 female undergraduates scoring between 125 and 139 and 50 (out of 100) from 79 to 112 on the California Short-Form Test of Mental Maturity were significantly different on the 16 PF only on Factors B and H ($p = .05$) and not on the California F scale. Significant comparisons appeared to be chance effects.—*Journal abstract*.

4662. Wiederanders, Mark R. (U Wisconsin, Fox Valley Ctr) Effects of failure experiences on configural properties of the aspiration level concept. *Psychological Reports*, 1975(Oct), Vol 37(2), 371-377.—Explored possible multidimensionality of the aspiration level concept and tested the relationship between increased threat during performance experiences and degree of dimensional complexity. 113 undergraduates responded to 9 definitions of aspiration during pretask and postfailure conditions. Cluster analyses indicated that not only were more dimensions of aspiration utilized, but dimensions were also more independent, during postfailure conditions of assessment. Content of the different dimensions suggested that aspirations set after failure serve qualitatively different functions than those stated under less intense conditions. While the aspiration component made up of calculated, realistic estimates of performance was very stable across conditions, hopeful and futuristic pretensions interacted complexly with performance feedback to produce less stable components. It is concluded that further empirical attention to these latter components might be more productive, in terms of adding to aspiration level theory, than the usual practice of assessing only realistic estimates of future performance. (15 ref)—*Journal abstract*.

4663. Wilkins, William E. (State University Coll New York, Brockport) Trends in powerlessness: A ten year follow-up. *Journal of Psychology*, 1975(Sep), Vol 91(1), 15-18.—Hypothesized that there would be a significant increase in powerlessness scores over a 10-yr period for a sample of 100 Ss drawn from a population of college students originally tested in 1964. At the follow-up, all Ss had graduated from college and were either professionally employed or engaged in child-rearing-home activities. The average age of the 1974 sample was 29 yrs and consisted of 70 females and 30 males. The test instrument was the adult version of Rotter's Internal-External (I-E) Control Scale which consists of 23 forced-choice items. There were no significant differences on total I-E scores over the 10-yr period. However, with use of the Mirels 2-factor scoring system, significant increases in social-political control were found. No significant differences in personal control were found. It is concluded that care should be taken in utilizing cross-sectional findings and that utilizing multidimensional scores suggests different results for previously published reports.—*Journal abstract*.

4664. X (Clark), Cedric. (U of Islam #26, San Francisco, CA) The Shockley-Jensen thesis: A contextual appraisal. *The Black Scholar*, 1975(Jul-Aug), Vol 6(10), 2-11.—Presents an historical overview of the thesis that Blacks are less intelligent than Whites. 3 hypotheses are suggested to explain the interest of Whites in Black intelligence, and 2 paradigms about racial intelligence are described. PHYSICAL AND PSYCHOLOGICAL DISORDERS

4665. Allodi, F. & Montgomery, R. (Clarke Inst of Psychiatry, Epidemiology Section, Toronto, Canada) Mentally abnormal offenders in a Toronto jail. *Canadian Journal of Criminology & Corrections*, 1975(Oct), Vol 17(4), 277-283.—Reports studies of the population of "1-A Hospital," the psychiatric unit of the Toronto jail. 3 samples were examined: (a) The 106 mentally abnormal offenders referred to the unit by courts for psychiatric examination January-March 1973 were predominantly male, poorly educated, and unemployed; 62% had previous convictions and 65% had previous psychiatric admissions. (b) Of these 106, 40 were diagnosed as dangerous and were certified. All were male and most were older than the group as a whole. 47% had been previously convicted and 67% had been hospitalized. (c) Study of 3,000 prison records showed that in 1969 40% of the 1-A Hospital inmates and in 1973 47% had had previous psychiatric hospitalization. For $\frac{1}{2}$ of the mentally abnormal offenders in the jail 1969-1973, less than 6 mo had elapsed between their discharge from a psychiatric hospital and their incarceration. Reasons for the continued existence of this hard core of chronic offenders are discussed. (French abstract) (18 ref)—*B. L. Kintz*.

4666. Ansari, J. M. (U Liverpool, England) A study of 65 impotent males. *British Journal of Psychiatry*, 1975(Oct), Vol 127, 337-341.—Studied 65 17-61 yr old patients primarily referred for erectile impotence. Demographic data were compared with those from a nonimpotent psychiatric outpatient group, matched for age. Results indicate that impotent cases do not form a homogeneous population and can be classified into 3 fairly distinct groups which differ in age, marital status, sex drive, pre- and postmarital relationships, and duration of illness. Group 1 develops impotence because of anxiety in sexual situations, Group 2 reacts to the sexual response and personality of their partners, while Group 3 declines, perhaps from inherent constitutional causes. Factors such as religious restrictions, sexual taboos, alcoholism, and homosexuality do not appear to be of any etiological importance. (15 ref)—*Journal abstract*.

4667. Awad, George A. & Poznanski, Elva O. (U Toronto, Canada) Psychiatric consultation in a pediatric hospital. *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 915-918.—Conducted a study of 30 hospitalized 5-12 yr olds who were referred for psychiatric consultation and 60 hospitalized 5-12 yr olds who were not. The medical charts of Ss were studied, and a questionnaire including a checklist of behavioral symptoms was administered to their parents. More psychopathology was found in Ss referred for consultation, but about 20% of Ss not referred also showed a high degree of psychopathology. Factors found to be associated with referral for psychiatric consultation were older age, longer hospital stay, many previous hospitalizations, and ambiguous diagnoses.—*Journal abstract*.

4668. Baumann, U. et al. (U Zurich, Psychiatrische Klinik, Switzerland) [The logic of decision in symptom

rating.] (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 225-235.

4669. Cleland, Charles C. (U Texas, Austin) **Schizophrenics' role in diagnosis.** *Schizophrenia Bulletin*, 1975(Spr), No 12, 15-16.—Discusses findings from D. L. Rosenhan's study (see PA, Vol 50:1600) which indicate that, in the context of a psychiatric residential facility, normal people posing as patients were not detected as sane by the hospital staff. Rosenhan's suggestion of the use of schizophrenics as diagnostic aides is examined, and the outline of an experimental study is presented.

(U Alabama) **Aberrant development in infancy: Human and animal studies.** Hillsdale, NJ: Lawrence Erlbaum, 1975. viii, 287 p.—Presents a collection of 22 symposium papers presented at the 7th annual Gatlinburg (Tennessee) Conference on Research and Theory in Mental Retardation. Topics include the effects of brain injury in primates, infant sucking responses as predictors of later development, the ontogeny of memory, risk factors in newborns, and the effects of drugs on newborns.

4672. Harrower, Molly; Thomas, Caroline B. & Altman, Ann. (U Florida) **Human figure drawings in a prospective study of six disorders: Hypertension, coronary heart disease, malignant tumor, suicide, mental illness, and emotional disturbance.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 191-199.—To test the hypothesis that human figures drawn by young adults are potential predictors of future disease states, drawings of 204 former medical students were examined 13-23 yrs later. During the interval, the 102 Ss in the experimental group developed 1 of 6 specified disorders, while the 102 Ss in the control group remained in good health. Drawings were classified in 8 categories based primarily on the stance of the figure. Categories of drawings found to be distinctive for the various groups are as follows: healthy control group: the neutral or uncommitted attitude; hypertension-coronary group: the inviting or input-demanding attitude; malignant tumor group: the attitude of ambivalence or conflict; suicide-mental illness group: the self-related or withdrawal attitude; emotional disturbance group: incomplete figures, bizarre figures, action scenes. Evidence suggests that the stance of the figure drawings reflects the S's attitude toward the outside world.—*Journal abstract*.

4673. Hearn, Warren M. (Boulder Abortion Clinic, CO) **The illness parameters of pregnancy.** *Social Science & Medicine*, 1975(Jul), Vol 9(7), 365-372. Pregnancy has always held certain risks of death or serious complications for women, although the medical profession has helped to reduce these risks significantly in recent years. These risks arise from the pathological features of pregnancy, which regularly appear in spite of the medical profession's insistence on calling pregnancy "normal," or rather, a modified state of health. It is argued that pregnancy can be placed easily within the traditional cognitive framework of illness by listing and classifying the illness parameters of pregnancy: etiology,

pathogenesis, pathophysiology, clinical manifestations including diagnostic signs and symptoms, laboratory findings complications, differential diagnosis, treatment, prognosis, epidemiology, prevention, and behavioral aspects. It appears that, in terms of modern knowledge, it would be more appropriate and useful to regard pregnancy as an illness for which Western society has already devised an elaborate system of prevention and treatment. (118 ref)—*Journal abstract*.

4674. Holding, T. A. & Barraclough, B. M. (MRC Unit for Epidemiological Studies in Psychiatry, U Edinburgh, Scotland) **Psychiatric morbidity in a sample of a London coroner's open verdicts.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 133-143.—Surveyed, for evidence of mental illness, 134 deaths recorded as open verdicts in the Inner West London Coroner's District during 1969-1970. For 82% of these deaths the probable verdicts were suicide or accident, and they were reclassified as undetermined deaths. Of these deaths 73% were diagnosed as mentally ill, 54% were receiving medical treatment for psychological symptoms before death, 42% had a history of psychiatric care, and 24% had made a previous suicide attempt. In these respects, undetermined deaths and suicide deaths resemble each other; both are drawn predominantly from the mentally ill.—*Journal summary*.

4675. Hontela, S.; Müller, H. F.; Grad, B. & Derkevorkian, K. (McGill U, Douglas Hosp, Montreal, Canada) **A psychogeriatric assessment program: II. Clinical and laboratory findings.** *Journal of the American Geriatrics Society*, 1975(Nov), Vol 23(11), 519-524. Statistical evaluation of clinical and laboratory data related to thyroid function in 80 patients led to the conclusion that (a) differences in thyroid function between psychogeriatric patients of the organic and functional types were only slight, as determined by clinical symptoms and thyroxine blood levels, and (b) factor analysis of 53 selected variables indicated that loading for "gross disturbance of psychobiologic function" may be related to the symptom complex of hyperthyroidism, hyperadrenergism, and particularly to psychobiologic symptoms rather than somatic symptoms of hyperthyroidism. In comparison with a group of 60 healthy old people, Ss showed many more signs of hyperactivity and other characteristics of this symptom complex. Results support the preliminary impression of an energetic (hyperthyroid sympathetic) reaction to mental decline, accompanied by plasma corticosteroid and EEG changes.—*Journal abstract*.

4676. Hook, Ernest B. (New York State Dept of Health, Birth Defects Inst, Albany) **Comment on comparison of settings for study of the prevalence of XYY genotype.** *Behavior Genetics*, 1975(Oct), Vol 5(4), 415. Argues that the setting in which D. R. Owen et al (see PA, Vol 53:9957) found no XYYs or XYYs among young male inmates cannot be validly compared with the mental-penal settings in which a pooled rate of 2% are found. It is noted that the Owen et al setting was one in which referrals usually were made by parental consent and only at times on court remand.

4678. Kroll, Phillip. (U Michigan) **Psychoses associated with marijuana use in Thailand.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 149-156.—Reports findings which show that marihuana use among the 45,000 Air Force troops stationed in Thailand during 1971-1972 was extensive. Nevertheless, only 5 cases of prolonged psychosis associated with marihuana use in this population were referred for psychiatric evaluation. These cases resembled several types of adverse reactions previously described in the literature: 1 case of a "marihuana psychosis"; 1 case of an "organic marihuana syndrome"; and 3 cases of "marihuana-mobilized functional psychosis." With the exception of the patient with the marihuana psychosis, this small group of men had either borderline or schizoid premorbid personalities. Other more transient psychotic episodes appear to go unreported by the troops because of the rapid clearing of symptoms and the punitive policy of the Air Force toward drug abuse. 4685. Nedoma, K. (U Karlova, Sexuogický ústav Faculty of Internal Medicine, Prague, Czechoslovakia) **[Normality of sexual behavior.]** (Czec) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 250-253.—Discusses the concept of "normality" in sexual behavior and suggests the perspectives from which a biologist, anthropologist, psychologist, lawyer, and someone with religious criteria would look at the issue. The main handicap for a clinician who studies sexual normality and aberration is his lack of personal experience with representative samples. He meets only those who come to him for help. The Kinsey report is quoted to show that, contrary to popular opinion, sexual behavior varies according to age, social and economic status, etc., and includes all kinds of noncoital intercourse which are

widely considered as abnormal. It is tentatively concluded that only sexual activities which cause harm or injury to human health, or use children as objects of gratification, should be considered deviant. (Russian & English summaries)—V. Fischmann.

4686. Paolella, John M. (Loyola U, Chicago) **Use of play activity in the assessment of atypical children.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 420-421.

4687. Parkes, Colin M. (St Christopher's Hospice, London, England) **Psycho-social transitions: Comparison between reactions to loss of a limb and loss of a spouse.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 204-210.—Conducted a study with 21 widows and 46 amputees to determine whether the psychosocial changes that both groups of Ss experience give rise to a pattern of response which is sufficiently uniform to justify including all such changes within a single frame of reference. In all Ss, a psychological reaction to loss designated as "grief" was commonly reported. This included an initial period of numbness, soon followed by restless pining and preoccupation with thoughts of the loss, a clear visual memory of the lost object, and a sense of its presence. Defensive processes, reflected in difficulty in believing in the loss and avoidance of reminders, were also evident. Widows differed from amputees in showing more evidence of overt distress in the early post-loss phase, but while these features diminished in prevalence in the course of the next year, the equivalent features reported by the amputee group remained virtually unchanged.—*Journal abstract*.

4688. Petersen, David M. & Thomas, Charles W. (Georgia State U) **Acute drug reactions among the elderly.** *Journal of Gerontology*, 1975(Sep), Vol 30(5), 552-556.—Notes that research in the field of social gerontology has not examined drug use and abuse among the aged. This report, based on an analysis of records of patients who were treated for acute drug reactions at a hospital in 1972, examines characteristics of acute reactions among a sample of 60 50-80 yr old patients and compares these characteristics with those of other age cohorts. Findings show that reactions were more likely to occur among Whites and females, that a substantial number of reactions followed the ingestion of 2 or more substances, that 1/3 of the admissions were directly related to suicide attempts, and that the majority of reactions among elderly admissions involved the ingestion of legally manufactured and distributed drugs.—*Journal abstract*.

4690. Škoda, C. et al. (Výzkumný ústav psychiatrický, Prague, Czechoslovakia) **[Diagnostic agreement of different teams of Czechoslovakian and foreign psychiatrists under conditions of different available information concerning patients.]** (Czec) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 211-220.—Investigated the degree of diagnostic agreement in 6 teams of psychiatrists to whom were successively presented data on (a) present psychopathology, (b) psychiatric anamnesis, and (c) social history of 10 patients diagnosed as

functional psychotics. The standardized data were obtained from research centers of the International pilot study of schizophrenia of the World Health Organization in Geneva. Each psychiatrist made 3 diagnoses (based on a, a + b, and a + b + c) that were compared with each other and with those made by all the other psychiatrists. Results were computerized and analyzed statistically. No significant relation between diagnostic agreement and age, sex, and number of years since graduation was found. The addition of anamnestic information (a + b) produced significantly lower diagnostic consensus than occurred between diagnoses based only on present psychopathology, and also changed the rank order of teams as to the degree of agreement among their members, but it significantly raised the subjective certainty of psychiatrists that their diagnoses were correct. Access to all types of information (a + b + c) had no significant bearing on overall results. It is suggested that diagnostic consensus among psychiatrists depends mainly on their training and diagnostic indoctrination. (18 ref)—V. Fischmann.

4691. Schubö, W.; Hentschel, U.; von Zerssen, D. & Mombour, W. (U München, Inst für Psychologie, W Germany) [Psychiatric classification by means of a discriminatory application of Q factor analysis.] (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 187-200.—Attempted to separate different pairs of psychiatric patient groups by means of a modified form of Q factor analysis comparable to discriminant analysis. The psychopathological states of 454 patients were rated using 2 psychiatric rating scales, the (Inpatient Multidimensional Psychiatric Scale) IMPS and the psychopathological and somatic scales of the AMP documentation system. Out of these patients, the 4 most frequently occurring groups (schizophrenia, paranoid form, $n = 45$; schizophrenia, unspecified form, $n = 47$; depressive psychosis, $n = 44$; depressive neurosis, $n = 53$) were selected. Each patient group was divided randomly into 2 sample, an analysis sample and a validation sample. Only those items were selected which discriminated best between any 2 analysis samples. Using G indices, a Q factor analysis was calculated and the results improved by a criterion-related additional rotation. The resulting weights were transferred to the validation samples in order to have a cross validation. The mean percentage of correct placements within the validation samples was 83%. (42 ref)—English abstract.

(Rigshospitalet, Copenhagen, Denmark) Concurrence of Turner's syndrome and anorexia nervosa. *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 31-35.—Describes the 9th known case of the concurrence of anorexia nervosa and Turner's syndrome. The question of whether the presence of Turner's syndrome represents a greater risk for a patient to develop anorexia nervosa is considered. (21 ref)

4694. Viederman, Milton. (Cornell U, Medical school) Psychogenic factors in kidney transplant rejection: A case study. *American Journal of Psychiatry*, 1975(Sep),

Vol 132(9), 957-959.—Examines the influence of psychic factors on kidney transplant rejection in a 24-yr-old patient who suffered emotional trauma. As an adolescent, this man had reacted to the death of his father with an incomplete mourning response and had coped with the loss through identification and a search for surrogates. The death of a paternal surrogate immediately preceded the transplant rejection. It is emphasized that the establishment of a causal relationship between a somatic event and a psychic antecedent is facilitated by demonstrating that a latent conflict has been evoked symbolically by an external event. It is suggested that further research into such correlations could significantly enhance the understanding of disease processes. —Journal abstract.

Mental Disorders

4695. Aarborg, Tove. (Bispebjerg Hosp, Copenhagen, Denmark) Psychotic and borderline psychotic adolescents: Frequency of psychiatric illness and treatment in childhood in 100 consecutive cases. *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 58-68.—Presents results of the 1st portion of a longitudinal study with 50 borderline psychotic and 50 psychotic adolescents admitted to a department of adolescent psychiatry. 53 Ss had been psychiatrically ill in childhood with evident symptoms, 22 Ss had been healthy in childhood, and 25 had shown nonspecific symptoms. The illness described in childhood were categorized as infantile borderline psychosis, borderline psychosis probable, and other psychiatric illnesses. A shift in diagnosis was often seen in the individual cases, but the symptoms in childhood and in adolescence had many similarities. The necessary treatment in childhood had not been given in 1/3 of the cases. The possible reasons for this are discussed. It is recommended that more emphasis be placed on emotional development in the evaluation of children, stressing development of interpersonal relationships through individual, family, and/or milieu therapy. A follow-up of children with symptoms in childhood left untreated and teamwork between child psychiatrist and adult psychiatrist with longitudinal studies are suggested. —Journal abstract.

4696. Agathon, Mélinée. (CNRS, Clinique des Maladies Mentales et de l'Encephale, Paris, France) A note on conditional reflex studies of schizophrenia in France. *Pavlovian Journal of Biological Science*, 1975(Jul Sep), Vol 10(3), 142-144.—Briefly reviews the history of schizophrenia studies in France. Since 1957, sensory conditioning procedures have been employed (EEG sound-light, evoked potentials in children, spiral aftereffect conditioning in adults) and more recently eyeblink and operant conditioning procedures.

4697. Akhtar, Salman et al. (U Virginia, Medical School) A phenomenological analysis of symptoms in obsessive-compulsive neurosis. *British Journal of Psychiatry*, 1975(Oct), Vol 127, 342-348. Studied 82 obsessional neurotics from a phenomenological point of view to delineate the various forms, frequencies, effects, and contents of obsessions and compulsions. 5 types of obsessions were identified: doubts, obsessive thinking, fears, impulses, and images. Compulsive acts could be classified into 2 types, depending on whether they

yielded to or diverted from the underlying obsession. 25% of the patients displayed no compulsions. The content of obsession could be classified in 5 broad categories: dirt and contamination, aggression, inanimate-impersonal themes, religion, and sexual matters. The absence of compulsions was associated with good prognosis. A prognosis-related hierarchical continuum of the severity of obsessional disorder is suggested. (22 ref) —*Journal abstract.*

4698. Anthony, Nicholas C. (U Cincinnati) **Malingering as role taking.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1738-1739.

4699. Baldessarini, Ross J. (Massachusetts General Hosp, Neuropsychopharmacology Lab, Boston) **The basis for amine hypotheses in affective disorders: A critical evaluation.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1087-1093.—Discusses a leading hypothesis concerning a biological basis of the affective disorders—that altered metabolism of brain amines may underlie the cause or pathophysiology of these conditions. Features of affective illnesses supporting biological hypotheses include the somatic symptoms, diurnal rhythm, and apparent "endogeneity" of many severe depressions and evidence of a genetic basis of manic-depressive illness. Development and preclinical study of medical therapies for the disorders substantially supported a relationship between mood disturbances and neurotransmitters and stimulated considerable advances in the physiology and pharmacology of central synaptic neurotransmission. It is noted that studies of amine metabolism in patients have not provided consistent support for the amine hypotheses. Moreover, these hypotheses have not led to a coherent biological theory of abnormal behavior, to an objective basis for differential diagnosis, or to the rational development of treatments more effective or safer than those known. (34 ref)—*Journal abstract.*

4700. Barac, Komnen & Volf, Nikola. (University Hosp, Inst of Neuropsychiatry, Belgrade, Yugoslavia) **[Acute psychotic states in a general hospital.]** (Yugo) *Socijalna Psihijatrija*, 1975, Vol 3(1), 43-47.—Presents data on 55 cases of acute psychosis recorded by a consultative psychiatric service in a general hospital. Of these, 43 were treated in the basic hospital units and 12 were moved to the psychiatric ward. Psychotic complications were most frequent in patients with kidney lesions treated with peritoneum dialysis and hemodialysis. Among patients with internal diseases, the most frequent psychotic conditions were acute confusion-delinium states which were probably based on metabolic changes. In 9 patients with peculiar premorbid personality traits and/or hereditary disorders, there was a psychotic, mostly transitory, decomposition. In surgical patients, abdominal disorders associated with alcoholism prevailed. The actual number of psychotic short episodes was far greater than in the basic hospital units. These findings suggest that psychiatric services, possibly within a neuropsychiatric department, are a prerequisite for the successful functioning of any general hospital.—*English summary.*

4701. Bartko, John J.; Strauss, John S. & Carpenter, William T. (NIMH, Theoretical Statistics & Mathematics Branch, Bethesda, MD) **Expanded perspectives for describing and comparing schizophrenic patients: II.**

Schizophrenia Bulletin, 1974(Win), No 11, 50-60.—Describes methods of comparing patients with discriminative symptoms in terms of a wide range of psychopathologic characteristics. The assumptions behind the methods, their clinical implications, and their applications are outlined. Analysis of variance procedures, discriminant analysis, logical tree models, and cluster analysis procedures are included.—L. Gorsey.

4702. Bech, Per et al. (Rigshospitalet, Psychochemistry Inst, Copenhagen, Denmark) **Quantitative rating of manic states: Correlation between clinical assessment and Biegel's objective rating scale.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 1-6.—Conducted a study with 11 manic inpatients to investigate a manic-state rating scale developed by A. Biegel et al (1971). Each scale item was tested for calibration, ascending monotonicity, and dispersion parallel to a global clinical assessment of the manic state. Interrater reliability was high when the scale was administered both by nurses and psychiatrists. 6 of the scale items were found to be valid (moves from one place to another, looks happy and cheerful, seeks out others, is distractible, has diminished impulse control, and demands contact with others). These items differed from the valid items in studies of Biegel by including increased social contact. As in the earlier study, a positive correlation was found between items concerned with depressed mood, indicating a fluctuation in the mood of Ss during 8 hrs of observation.—*Journal abstract.*

4703. Bellak, Leopold. (Albert Einstein Coll of Medicine, Yeshiva U) **Intercultural studies in search of a disease.** *Schizophrenia Bulletin*, 1975(Spring), No 12, 6-9.—Presents a 3-part discussion on (a) cross-national study of the definition of schizophrenia in the US and London, (b) an international pilot study of schizophrenia, and (c) problems of classification of schizophrenia. Results of the study in the US and London indicate that Americans had a broader concept of schizophrenia than their British counterparts and that this tendency probably reflected 2 aspects of American culture: a lesser tolerance for socially-psychologically deviant behavior and greater psychological mindedness. The following findings of the international study are discussed: (a) the 87.3% diagnostic reliability that was based on Ss' past history and social description and (b) concordant schizophrenics' higher scores on delusions, hallucinations, flatness of affect, and depressive symptomatology.—M. E. Pounsel.

4704. Biller, Owen A. (U Arkansas) **Communication of emotions through instrumental music and the music selection preferences of patients and nonpatients experiencing various emotional moods.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3050.

4705. Blaney, Paul H. (U Texas, Austin) **Implications of the medical model and its alternatives.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 911-914.—The term "medical model" is often used as if it referred to a single, well-understood set of assumptions about psychiatric disorders. It is argued that, actually, there are at least 4 different meanings that a person saying "emotional disorders are diseases" might intend to communicate. The models usually suggested as alternatives are addressed to one or another of these medical model implications. It is recommended that a

distinction be maintained between the virtues of these models as conceptual aids and their virtues and weaknesses as shapers of public opinion and professional practice.—*Journal abstract.*

4706. **Boling, Lenore & Brotman, Carl.** (Massachusetts Mental Health Ctr, Boston) **A fire-setting epidemic in a state mental health center.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 946-950.—Describes a period in which 13 fires were set by 4 patients on an inpatient service of a state mental health center. Unlike previous patients reported in the literature, these individuals had no history of fire setting, although they did display several previously reported characteristics (e.g., primitive and impulsive personalities and absent fathers). The influence of institutional changes and conflict upon such disruptive patient behavior is emphasized. It is suggested that efforts to deal with fire setting should recognize the total situation and include clear limit setting by the hospital administration. (16 ref)—*Journal abstract.*

4707. **Buck, Carol; Hobbs, G. Edgar; Simpson, Helen & Wanklin, James M.** (U Western Ontario, London, Canada) **Fertility of the sibs of schizophrenic patients.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 235-239.—A study of 545 schizophrenics provided evidence against the hypothesis that heterozygous carriers of a schizophrenic gene have a reproductive advantage through enhanced fertility. An advantage arising from lower mortality between birth and the end of the reproductive period was not investigated, but should be examined before other explanations of the apparently stable polymorphism of schizophrenia are proposed. (20 ref)—*Journal abstract.*

4708. **Burton, Jimmy G.** (Colorado State U) **Repression-sensitization, need for approval, instructional stress, and indices of adjustment on a sentence completion task.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1271.

4709. **Burvill, P. W.** (U Western Australia, Perth Medical Ctr) **Mental health in isolated new mining towns in Australia.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 77-83.—Discusses characteristics of inhabitants and of the new Australian towns themselves which contribute to an increased incidence of mental illness. Findings were based on observations of existing and new towns, with populations that have expanded over 10 times. Reasons why people shift to these new towns, characteristics of open vs closed towns, personality characteristics which make the inhabitants more at risk to develop a psychiatric illness, the experience of migration, and the relationships between life experiences, personality characteristics, and susceptibility to illness are all examined. It is suggested that environmental factors are precipitating or aggravating factors in the production of mental illness, rather than major forces in its occurrence. Implications for etiological studies are discussed. (25 ref)—*L. Gorsey.*

4710. **Burvill, P. W. & Kidd, Cecil B.** (U Western Australia, Perth Medical Ctr) **The two town study: A comparison of psychiatric illness in two contrasting Western Australian mining towns.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 85-92.—Presents results from a survey of patients identified by their general practitioner as having conspicuous psychi-

atric morbidity, according to W. I. Kessel's (1960) classification, during a 3-mo general practice survey in 2 Western Australian towns: Gynalla, a new expanding town and Jaburoo, an established economically stagnant town. Findings show a higher general practice consultation attendance rate for both sexes and a higher rate of psychiatric illness among females in Jaburoo than in Gynalla. In Gynalla psychiatric cases among women formed a disproportionately high percentage of all general practice attendances.—*Journal abstract.*

4711. **Carpenter, William T.; Strauss, John S. & Bartko, John J.** (NIMH, Bethesda, MD) **Use of signs and symptoms for the identification of schizophrenic patients: I.** *Schizophrenia Bulletin*, 1974(Win), No 11, 37-49.—Suggests that the 9-nation methodology of the World Health Organization's International Pilot Study of Schizophrenia provides an opportunity for scientific assessment of established diagnostic schools. To illustrate the value of a multination design, data analyses previously done in evaluating the diagnostic approaches of K. Schneider (1959) and G. Langfeldt (1937, 1969) are summarized. A rationale for using cross-cultural research methodologies in the study of highly discriminating signs and symptoms in schizophrenia is also presented. A test of the system, which includes 12 signs and symptoms, is reported. The system appears to be particularly reliable, since it is operationalized by a few questions that a psychiatrist can be taught to score reliably from a single psychiatric interview. It can be applied at various levels of diagnostic stringency and in each case provides an estimate of false negative and false positive diagnostic assignments.—*Journal summary.*

4712. **Cerny, Leonard J.** (Melodyland Counseling Clinic, Anaheim, CA) **Christian faith and thanatophobia.** *Journal of Psychology & Theology*, 1975 (Sum), Vol 3(3), 202-209.—Investigated whether Christian faith increases or decreases thanatophobia (fear of death or anxiety regarding it) in a field survey of 248 undergraduates. Significantly less fear of death was found in the Christian group as compared to a non-Christian group. (15 ref)

4713. **Chapman, Loren J. & Chapman, Jean P.** (U Wisconsin, Madison) **How to test hypotheses about schizophrenic thought disorder.** *Schizophrenia Bulletin*, 1975(Spr), No 12, 42-59.—Argues that the voluminous studies on schizophrenic cognition have been made necessary by the lack of consensus among investigators regarding the nature of schizophrenic thought disorder. Some of the difficulties in the more popular designs are examined (including defining and measuring schizophrenic thought disorder, the distinction between positive and negative symptoms, the measurement of differential deficit and differential occurrence of positive symptoms, and methodological problems resulting from matching schizophrenic and normal groups). It is concluded that the most potentially fruitful approach to resolving the heterogeneity of schizophrenic cognition is probably that of discovering new subvarieties of schizophrenia with different kinds of thought disorder. The use of adequately matched tasks will make this distinction possible. (23 ref)—*M. F. Parnuel.*

4714. **Crain, Peter; Goldstone, Sanford & Itham, William T.** (Cornell U, Medical Coll, New York, NY) **Temporal information processing and psychopathology**

Perceptual & Motor Skills, 1975(Aug), Vol 41(1), 219-224.—Prior studies show impaired temporal discrimination by schizophrenic and neurologic patients reflected in decreased information transmission. This report describes a study of 8 more carefully diagnosed schizophrenic patients, aged 17-70 yrs, separating those with neurologic signs. Using temporal discrimination tasks involving 2 psychophysical methods, 8 schizophrenic Ss with no organic signs did not differ from 17 nonpsychotic, nonorganic Ss; an organic group ($n = 5$) transmitted less information than the other Ss. It is suggested that prior results were a product of casual diagnosis that ignored organic factors; reduced efficiency of temporal processing is associated predominantly with neurologic impairment.—*Journal abstract*.

4715. Crighel, E.; Matei, M. & Rosianu, C. (Inst of Neurology & Psychiatry, Bucharest, Romania) **Visual evoked responses and their dispersion pattern in neurotic patients.** *Psychiatria Clinica*, 1974, Vol 7(6), 317-327.—Studied the averaged visual evoked response (AVER) and the DP (a pattern of dispersion resulting from the variability of each time point locked to the stimulus onset) in 20 30-53 yr old neurotics in comparison with 27 normal adult controls matched for age range. In neurotics without depression and/or anxiety, the AVERs were normal and the DPs showed a shortening of the 2nd period; in neurotics with depression and/or anxiety, the AVERs were also normal but the 2nd period of the DPs disappeared.—*Journal abstract*.

4716. DeFonso, Lenore E. (Indiana U) **Two psycholinguistic studies of language difficulty in schizophrenics.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 408.

4717. Donnelly, Edward F.; Murphy, Dennis L. & Scott, Winfield H. (NIMH, St Elizabeths Hosp, Washington, DC) **Perception and cognition in patients with bipolar and unipolar depressive disorders: A study in Rorschach responding.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1128-1131.—Administered the Rorschach test to 16 bipolar and 13 unipolar patients hospitalized during a depressive episode. 2 contrasting styles of Rorschach responding differentiated the 2 groups. The bipolar style of response is characterized by selective attention to the more objective aspects of the inkblots, while the unipolar style of response is characterized by a more subjective approach. Primary response to color was found only in the protocols of bipolar Ss. The styles of response are discussed in relation to other studies showing similar results based on self-assessment and clinical tests. It is suggested that perceptual-cognitive structuring of the external environment may be related to, or predispose, mood levels. (22 ref)—*Journal abstract*.

4718. Donovan, James M.; Dressler, David M. & Geller, Ruth A. (Harvard U, Medical School, Community Health Plan, Boston MA) **Psychiatric crisis: A comparison of schizophrenic and nonschizophrenic patients.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 172-179.—23 nonschizophrenic and 16 schizophrenic patients on a short-term crisis intervention ward were extensively interviewed to discover whether the crisis precipitants and the crisis experience differed for the 2 groups. As opposed to the schizophrenic Ss, the

nonschizophrenic, "distraught" Ss led orderly lives and were more likely to be in problematic developmental life stages (i.e., late adolescence) or to be physically ill. For the distraught patients, the precipitating events were clearer and were more likely to involve interpersonal or narcissistic loss (i.e., the end of a romance), overt anger was less likely to be expressed, and parental figures were less likely to be involved. Both the nonschizophrenic and the schizophrenic people appear to be chronically vulnerable to external stress. A phenomenological description of their psychopathology is included to explain this vulnerability. Suggestions about treatment approaches are developed.—*Journal abstract*.

4719. Douglas, Donald B. & Sara, Dorothy. (Lenox Hill Hosp, New York, NY) **Handwriting in schizophrenia: Some clinical observations.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 561-567.—Uses a listing of graphological traits often attributed to schizophrenics to analyze schizophrenics' handwriting ($n = 75$), handwriting of patients with anatomical brain disease ($n = 50$) and handwriting of normal persons ($n = 50$). Results indicate that handwriting does relate closely to mental status, and that graphological analysis is firmly consistent with the concept that schizophrenic personality changes and other epiphenomena can vary greatly from minimal to unique and bizarre; at deeper levels the mechanisms of schizophrenic and organic psychoses begin to coalesce. (16 ref)—*Journal summary*.

4720. Duncombe, Margaret L. (U Denver) **An etiologic analysis of mental impairment rates: A test of the social causation hypothesis versus the social drift hypothesis.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3556-3557.

4721. Dunner, David L. & Fieve, Ronald R. (New York State Psychiatric Inst, NY) **Psychiatric illness in fathers of men with bipolar primary affective disorder.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1134-1137.—Administered a systematic interview regarding family history to 48 men with bipolar affective illness who were attending a lithium clinic. Mean age range of Ss was 47-54 yrs. Several families were found in which both the S and his father had affective disorders, but the mother and maternal 2nd-degree relatives were well. Of 30 Ss who had histories of hospitalization for mania, 3 had fathers with affective disorder (all bipolar). Of 18 Ss who had depression and hypomania, 1 father had unipolar depressive disorder. The hypothesis that bipolar manic-depressive illness may be transmitted by a single dominant genetic factor on the X chromosome is discussed in relation to these ill father-ill son pairs.—*Journal abstract*.

4722. Faber, Raymond & Abrams, Richard. (New York Medical Coll, Metropolitan Hosp Ctr) **Schizophrenia in a 47,XXX male.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 401-403.—Reports a case of schizophrenia in a 47,XXX male diagnosed according to strict phenomenological criteria. It is suggested that the 47,XXX chromosome anomaly should be added to the list of possible causes of symptomatic schizophrenia and that future investigations of the effects of an extra Y chromosome on brain function emphasize the etiology of idiopathic schizophrenia.

4723. Finch, A. J.; Deardorff, P. A. & Anderson, James. (Virginia Treatment for Children, Richmond) **Affective relationship, locus of control, and imitative behavior.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 71-74.—Studied the effects of the affective relationship between a model and an observer and locus of control on imitative behavior. 28 7-15 yr old emotionally disturbed boys were exposed to their most and least liked peer on a simple imitative task. Locus of control was determined by the Nowicki-Strickland Locus of Control Scale for Children. More imitative responses were exhibited to the most liked peer than to the least liked peer, and a positive correlation between number of imitative responses and internal locus of control was found. Results indicate a need to control the affective relationship between the model and observer and support A. Bandura's (1971) suggestion that imitative behavior is primarily under self-reinforcement control. —*Journal abstract.*

4724. Fischer, Daniel E.; Halikas, James A.; Baker, John W. & Smith, James B. (Washington U, Medical School, St Louis) **Frequency and patterns of drug abuse in psychiatric patients.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 550-553.—Presents demographic findings, specific drug abuse patterns, and relationships among variables to determine differences between abusing and nonabusing patients. Findings indicate that psychiatric patients are a high risk group for drug abuse.

4725. Flemenbaum, Abraham & Flemenbaum, Esther. (Texas Tech U, Medical School) **Field dependence, blood uric acid and cholesterol.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 135-141.—Presents a preliminary report of the correlation of field dependence, blood uric acid, and cholesterol for 65 17-73 yr old recently admitted patients to the psychiatric services of the University of Minnesota. The values for all 3 variables were taken once within 24-48 hrs after admission and prior to drug treatment whenever possible. Results are suggestive that the initial hypothesis—high blood uric acid, low-cholesterol individuals are more field-independent, and high-cholesterol, low blood-uric acid individuals are more field-dependent—holds, although this difference is mostly influenced by the values of cholesterol. Probably because of the small number of Ss tested no relationship could be observed with blood types used as genetic markers. Further controlled studies are suggested and are currently being carried out. (16 ref)—*Journal abstract.*

4726. Foster, F. Gordon & Kupfer, David J. (Western Psychiatric Inst & Clinic, Pittsburgh, PA) **Psychomotor activity as a correlate of depression and sleep in acutely disturbed psychiatric inpatients.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 928-931.—Combined a lightweight telemetric mobility sensing system with nightly EEG-sleep recordings to obtain continuous monitoring of rest-activity cycles among 33 psychiatric patients hospitalized for primary depression or acute schizophreniform thought disorder. Ss with primary depression had a significantly higher percentage of their total 24-hr motor activity distributed during the night. Furthermore, this increased nocturnal motor activity did not correlate significantly with concurrent EEG-sleep measures of wakefulness. Indeed, the best predictors of

wakefulness were measures of daytime activity. It is suggested that this desynchronization of sleep and nighttime motor activity in primary depression may explain the need for combined pharmacotherapy in some severely depressed patients. Expressing activity as a percentage distribution function, rather than in terms of absolute amplitude, may provide an objective diagnostic index of depression. (27 ref)—*Journal abstract.*

4727. Foulds, G. A.; Bedford, A. & Csapo, K. G. (MRC Unit for Epidemiological Studies in Psychiatry, U Edinburgh, Scotland) **Class change in personal illness hierarchy.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 316-319.—68 psychiatric inpatients who had completed the authors' Delusions-Symptoms-States Inventory on admission were retested after 1 mo. On 1st testing 92.6% conformed to the hierarchy of classes of personal illness model, and on the 2nd occasion 91.2% conformed. Of those who could improve, 72% did so, most commonly by moving down 1 hierarchy class (e.g., from the neurotic symptoms class to the dysthymic states class). Other data, however, suggest that although it is clear that the patients as a group changed markedly, they did not depart from the hierarchy. Results indicate that either the symptoms further up the hierarchy remit before those lower, or they remit together; certainly those lower in the hierarchy do not go first. It is suggested that the results would be difficult to accommodate within strict disease-entity models and that they have different implications for both treatment and the assessment of change in current state.—*Journal abstract.*

4728. Foulks, James D. (Georgia State U) **Time perspective as a function of degree of thought disturbance.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 411.

4729. Gabriel, E. (Psychiatrische Universitätsklinik, Vienna, Austria) [The influence of psychoorganic deterioration in the aged on the course of the so-called late schizophrenias.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(6), 358-364.—Reports empirical findings concerning the relationship between psychoorganic deterioration in old age and the course and clinical symptoms (delusions, presenting symptoms) of the late schizophrenias. The probands were reexamined, in their senium decades, after the onset of the illness. A significant relationship was found between severe psychoorganic deterioration occurring in old age and a chronic course of the psychoses, and between severe psychoorganic deterioration and the occurrence of schizophrenic thought disorder as the main symptom. Absent or slight psychoorganic deterioration in old age was significantly correlated with manic-depressive dysthymia as the main symptom. Further development of delusions appears to be independent of the degree of psychoorganic deterioration in old age. (German summary) (16 ref) *English abstract.*

4730. Gambini, Josephine M. (Wayne State U) **Piaget's theory: Conceptual development and affective development in diagnosed emotionally disturbed public school males.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3187-3188.

4731. Gay, Volney P. **Psychopathology and ritual: Freud's essay "Obsessive actions and religious practices."** *Psychoanalytic Review*, 1975(Fal), Vol 62(3),

493-507.—Argues that while the rhetorical tone of Freud's essay (1907) supports the identity of religious acts and obsessional neurosis, the actual arguments and concepts which he uses do not. It is suggested that a closer reading of the actual metapsychological terms used reveals that the mechanisms said to underlie religious acts and obsessional neurosis are not identical. (30 ref)—G. S. Speer.

4732. Goldstein, Stanley M. (Ohio State U) **The awareness of psychological causality with regard to the choice of symptomatology in childhood psychopathology.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 874.

4733. Greenberg, Judith A. **Schizophrenia: Heretical notes on a diagnostic category.** *Schizophrenia Bulletin*, 1975(Spring), No 12, 10-14.—Argues that the categories presented in psychiatric literature are often translated into many "languages" depending on the experiences of the reader. 3 rules which are designed to help alleviate this problem are presented, and the problems of defining "schizophrenia" (and other terms) are discussed on the basis of these rules.

4734. Gruzeller, J. H. (University College Hosp Medical School, London, England) **The cardiac responses of schizophrenics to orienting, signal and non-signal tones.** *Biological Psychology*, 1975(Sep), Vol 3(2), 154-155.—Examined the cardiac responses of 40 22 58 yr old schizophrenic inpatients under 3 conditions: (a) to repeated 75-db, 1,000-Hz (orienting) tones of no attentional significance; (b) to 75-db, 1,000- and 2,000-Hz tones presented randomly and requiring a motor response to the 1,000-Hz (signal) tone; and (c) to 85-db, 1,000-Hz orienting tones. Responses of 20 nonpsychotic psychiatric patients were examined to the 75-db tones. All Ss were subdivided upon the basis of electrodermal responsivity during conditions (a) and (c), into groups of responders, nonresponders, and habituators. All groups exhibited a decelerative response with a latency of less than 1 sec. The groups were differentiated by the 2nd component of the response to the orienting tones: responders—acceleration; habituators—deceleration; nonresponders—predominantly no response. All exhibited accelerative responses to the signal tones. Parallels between cardiac and electrodermal responsivity are outlined. (26 ref)—*Journal abstract*.

4735. Grünner, O. (Výzkumný ústav balneologický, Lázně Jeseník, Prague, Czechoslovakia) **[Psychophysiological correlation: Pyknotic index of leukocytes and personality dimensions.]** (Czech) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 234-240.—Studied the relation between the pyknotic index (PI) in aging leukocytes and the severity of mental disturbance as reflected in psychiatric diagnoses and MMPI profiles of 118 randomly selected middle-aged patients. An abnormally high PI was found significantly ($p < .05$) more often in psychotics than in neurotics, and among neurotics more often in the more seriously disturbed. Patients with high PI had almost twice as many ($p < .001$) abnormally high or abnormally low MMPI scales as those with normal PI. The possible neurophysiological mechanisms underlying the relations between aging leukocytes and psychopathology are discussed. (Russian & English summaries) (15 ref)—V. Fischmann.

4736. Guggenheim, Frederick G. & Babigian, Haroutun M. (Harvard Medical School, Boston) **Diagnostic consistency in catatonic schizophrenia.** *Schizophrenia Bulletin*, 1975(Win), No 11, 103-108.—Examined diagnostic consistency in a group of 572 cases with multiple contacts diagnosed at least once as having catatonic schizophrenia in the Monroe County, New York, *Psychiatric Register* between 1960 and 1966. The diagnosis of catatonic schizophrenia was made in a majority of contacts for less than 50% of the group. Catatonic schizophrenia was used inconsistently and rarely by some facilities and not infrequently and consistently by others. When a patient visited multiple facilities and catatonic schizophrenia had been diagnosed at one of them, he or she had less than a 10% chance of having agreement on the diagnosis in a majority of contacts with each of the facilities. The transient occurrence of catatonic symptoms in other types of schizophrenia and other types of illnesses may be one reason for the low degree of diagnostic consistency. The diagnostic process, which is often hurried, imprecise, and without therapeutic interest is also implicated. (19 ref)—*Journal summary*.

4737. Gunderson, John G. & Mosher, Loren R. (Harvard U, Medical School, Boston) **The cost of schizophrenia.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 901-906.—The cost of schizophrenia has been estimated at \$11.6 to \$19.5 billion annually. About 1/3 of this cost is due to lack of productivity by schizophrenic patients and about 2/3 to treatment costs. The estimate might be considerably higher if better figures were available on the cost of maintaining patients in the community. In the absence of more effective treatment, the saving from the current trend toward shorter hospitalization cannot be expected to decrease—and may actually increase—the overall cost of schizophrenia to society. Recommendations are made which are aimed at reducing the cost by helping schizophrenics to be more productive through a system of community alternative-care facilities, increased rehabilitation services, aftercare, and research. (32 ref)—*Journal abstract*.

4738. Guthrie, Robert D. & Wyatt, Richard J. (U Washington, Medical School, Seattle) **Biochemistry and schizophrenia: III: A review of childhood psychosis.** *Schizophrenia Bulletin*, 1975(Spring), No 12, 18-32.—Reviews biochemical studies of childhood psychosis. Some of the problems inherent in these studies are examined, including the absence of a uniformly accepted definition of psychosis and the lack of a well-defined, standardized diagnostic system. It is argued that none of the biochemical parameters studied to date, including the biogenic amines, the pink spot, the mauve factor, bufotenine, histamine, serum factors, chromosomal abnormalities, endocrinological changes, or other metabolic factors, have been shown to be causally related to the etiology of one or more of the childhood psychoses. Experimental methods used in these studies are also discussed. (73 ref)—M. E. Pounsel.

4739. Guze, Samuel B.; Woodruff, Robert A. & Clayton, Paula J. (Washington U, Medical School, St Louis) **The significance of psychotic affective disorders.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9),

1147-1150. —Studied 253 patients with primary and secondary affective disorders. The data were obtained as part of a long-term systematic follow-up and family study of a cross-section of a clinic population. Results show that psychotic features were more frequent among bipolar Ss. Except for more frequent psychiatric hospitalization among unipolar Ss with psychotic features, no demographic, family history, or parental home variable was found to distinguish between those with and without psychotic features. Chance variation probably accounted for the few symptoms whose frequencies were different depending on the presence or absence of psychotic features. Results failed to support the validity of a classification of affective disorders based on the presence or absence of psychotic features. (20 ref)—*Journal abstract*.

4740. Güttel, B.; Schubert, H. & Zapotoczky, H. G. (Psychiatrische Universitätsklinik, Vienna, Austria) [The problem of a cyclic basic structure in neurotic disorders.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(6), 365-374.—Hypothesized that a nuclear syndrome consisting of alterations in drive, mood and autonomic activation, possibly contributing to neurotic disorders, is independent of such factors as sex, education, premorbid personality, duration of illness, age at onset of the illness, social mobility during the illness, number of pregnancies, family history, occupation, marital state, social class compared with that of parents, social contacts, or past physical illnesses. It was shown in a sample of 50 neurotic outpatients that the factor "past illnesses" influenced the number of vegetative symptoms prior to therapy. The effect of psychotherapy on psychic and vegetative disturbances was greater in women with children (i.e., those not working outside the home). In patients whose social class was not changed during the illness, the number of vegetative symptoms diminished more than in the others. In all the other cases, improvement was not related to the factors mentioned. Generally, results be interpreted as supporting the hypothesis. (German summary)—*English abstract*.

4741. Hare, E. H. (Bethlem Royal Hosp, Beckenham, England) **Manic-depressive psychosis and season of birth.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 69-79.—National series of psychiatric inpatients studied in Scandinavian countries and in England and Wales have all shown that, compared with live births in the general population, schizophrenic patients have a significant excess of births in the early months of the year. There has been disagreement, however, on whether a similar birth distribution holds for manic-depression. The present paper presents new data on the seasonal distribution of births of patients born in England and Wales between 1921 and 1955. Compared with all live births, manic-depression was associated with a significant excess of births in the 1st quarter and a corresponding deficiency in the 3rd quarter of the year. Neurotic depression showed no such association. Possible reasons for the disagreement among national findings for manic-depression include differences in the proportion or 1st admissions in the series, differences in age structure, and differences in diagnostic practice and classification. The importance of the age structure of a series is considered in relation to (a) the possible effect of age on the

manifestation of a disorder associated with some seasonally related constitutional damage, (b) the possibility of secular variation in the severity of a seasonally related noxious factor, and (c) the effect of age incidence on distorting the expected seasonal distribution of births in any series of cases.—*Journal abstract*.

4742. Helzer, John E. (Washington U, Medical School, St Louis) **Bipolar affective disorder in Black and White men: A comparison of symptoms and familial illness.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1140-1143.—Administered a systematic psychiatric interview to 11 Black and 19 White men in their early to mid thirties with conditions diagnosed as manic-depressive disease, manic type. In addition, as many of their 1st-degree relatives as could be contacted were also interviewed. Demographic, clinical, and family history variables were compared for the 2 races. With the exception of a greater preponderance of alcoholism in the paternal relatives of the Black Ss, few differences were found between the 2 groups in terms of the variables studied. It is concluded that the clinical and familial expression of bipolar affective disorder is similar in the 2 races.—*Journal abstract*.

4745. Huber, Gerd; Gross, Gisela & Schüttler, Reinhold. (Lubeck U of Medicine, W Germany) **A long-term follow-up study of schizophrenia: Psychiatric course of illness and prognosis.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 49-57.—Conducted a systematic psychiatric follow-up study of 502 schizophrenics, using the evaluation criteria described by G. Huber (1971) throughout the investigation. After an average course of disease of 22.4 yrs, 22.1% of the patients showed complete psychopathological remission, 43.2% had noncharacteristic types of remission, and 34.7% suffered from characteristic schizophrenic deficiency syndromes. At the time of the last follow up investigation, 86.7% of the patients were living at home, while 13.3% were permanently hospitalized. Of the entire sample, 55.9% were found to be "socially recovered." Higher education, psychoreactive provocation, depressive traits, perception of delusions, catatonic agitation, noncharacteristic thought disorders, and symptoms of depersonalization at the onset of the illness tended to carry with them a favorable prognosis. On the other hand, low intelligence, abnormal primary personality, premorbid disturbances in social behavior, broken homes, prolonged prodromal stages, pneumoencephalographically measurable atrophic or dysplastic changes in the brain ventricles as well as somatic and auditory hallucinations and predominance of hebephrenic symptoms at the onset of the illness tended to lead to an unfavorable prognosis. The principle of the basic reversibility of typical schizophrenic symptoms and the extensive irreversibility of the noncharacteristic defect is important for the psychopathological and social long-term prognosis. 4746. Jonas, A. David & Jonas, Doris F. (US Army Hosp, Wuerzburg, W Germany) **An evolutionary context for schizophrenia.** *Schizophrenia Bulletin*, 1975(Spr), No 12, 33-41.—From an evolutionary point of view, it is argued that the schizophrenic manifests behavior that belongs to an earlier stage of human development, and behavior which is appropriate to that mode of life. Arguments to support this theory are presented through a discussion of manifestations of schizophrenia (paranoid ideation, schizophrenic cognition and language, and heightened or diminished sensory perceptions); similarities and differences between schizophrenics and normals; and a behavior continuum (the average, sensitive, and hypersensitive normal and the schizophrenic). It is maintained that conclusions regarding the schizophrenic in an institutional environment have a parallel with those about primates that were observed in alien and stressful surroundings.—*M. E. Pounsel.*

4747. Kay, D. W. et al. **Genetic hypotheses and environmental factors in the light of psychiatric morbidity in the families of schizophrenics.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 109-118.—Examined the hypothesis that schizophrenia and some nonpsychotic abnormalities occurring in their close relatives are both manifestations of a unitary schizoid state due to a major dominant gene. Results are based on the 57 families of schizophrenics in which information about the psychiatric state of both parents was available and on 50 of these families in which at least 1 sib reached the age of 18 yrs. Comparisons were made (a) of the observed and expected frequencies of the different types of parent mating and (b) of the observed and expected risks among sibs in families with neither, or with one of both, of the parents abnormal. It is concluded that results do not fit well with the model of inheritance of the schizoid state through a major dominant gene. (17 ref) *Journal abstract.*

4748. Kendell, R. E. (U Edinburgh, Scotland) **The concept of disease and its implications for psychiatry.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 305-315. Critically examines the proposition, generally put forth by the antipsychiatry movement, that mental illnesses are not illnesses at all, but merely alternative ways of behaving that alarm people, or reactions to the "insane" behaviors of society. Problems in distinguishing illness from nonillness are considered in terms of an historical review of changes in the conceptualization of disease (e.g., the idea of disease as a lesion and statistical concepts of disease). The question of whether mental illnesses possess the essential attributes of illness is also considered; it is argued that mental illnesses are justifiably diseases because they are associated with reduced fertility and life expectancy, and that these 2 constitute a biological disadvantage. It is concluded that the evidence supports the argument that schizophrenia, manic-depressive illness, and some sexual disorders and forms of drug dependence carry an intrinsic biological disadvantage and on these grounds are justifiably regarded as illness. It is not clear whether the same is true of neurosis and personality disorders. (27 ref)—*L. Gorsey.*

4749. Maher, Kevin R.; Harper, Juliet F.; Macleay, Allan & King, Maurice G. (U Newcastle, Australia)

Peculiarities in the endocrine response to insulin stress in early infantile autism. *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 180-184.—11 4-13 yr old autistic children subjected to the stress of insulin-induced hypoglycemia showed slower recovery of blood glucose and faster and intractable cortisol response in the 3 hrs following the stress. Data suggest that autistic children overreact to this stressor and support clinical evidence of stress intolerance. It is suggested that this peculiarity may be implicated in an explanation of the abnormal behavior seen in this disorder. (15 ref)—*Journal abstract.*

4750. Maller, O. (Pardessia Psychiatric State Hosp, Natanya, Israel) **A Motivation Evaluating Rating Scale for chronic impaired schizophrenics (MERS).** *Psychiatria Clinica*, 1974, Vol 7(6), 347-357.—Describes the MERS, a rating scale intended to evaluate the motivational level of chronic impaired schizophrenics (defect-schizophrenia). The need for such a measuring tool is stressed, considering the relatively poor symptomatology of these patients, the difficulties in discerning changes in the patients' condition, and the fact that lack of motivation is a basic feature of the schizophrenic impairment. The MERS, which consists of 3 main subscales, strives to be as comprehensive as possible, extending from the lowest biological level to the highest social and cultural aspects of motivation. Initial reliability tests with 66 chronic impaired schizophrenics demonstrate a general reliability of 0.90 and reliabilities as high as 0.98 in some subscales.—*Journal abstract.*

4751. Matoušek, O. & Nesnídalová, R. (Krajský ústav národního zdraví, Oddělení dětské a dorostové psychiatrie, Prague, Czechoslovakia) [**Research in pedopsychopathy.**] (Czech) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 257-262.—Attempts to clarify the diagnostic concept "childhood psychopathy" by critically reviewing different and often widely diverging opinions about the classification, etiology, determinants, etc. of this disorder. It is argued that the term should not be applied to children under 15 and that, before making the diagnosis, cultural connotations and developmental and interactional conditions should be considered. A planned longitudinal study of influences that transform behavior problems in children into psychopathic disorders is described. (Russian & English summaries)—*V. Fischmann.*

4752. McCabe, Michael S. (U Iowa, Medical Coll) **Demographic differences in functional psychoses.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 320-323.—Analyzed data from the National Health Service, Denmark, for age at 1st admission, sex, and length of stay in hospital for patients with reactive, manic-depressive, and schizophrenic psychoses. Differences in sex incidence ratios, age at 1st admission, and length of stay were evident between the 3 psychoses. Results provide indirect evidence supporting the separate diagnostic categories. (Santa Clara Valley Medical Ctr, Psychiatric Education & Research, San Jose, CA) **Persecutory delusions: A cybernetic model.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1038-1044.—Proposes a cybernetic model for the formation and maintenance of

persecutory delusions. During the formation of persecutory ideation, the threat of loss of control over the self or others interacts with predictions of control from others. This interaction may result in feelings of alien control followed by persecutory explanations. Since the persecutory explanations provide the individual with a new goal of resisting others' influence in order to prevent being controlled, they reduce the threat of loss of self-control. It is concluded that this is how persecutory delusions are maintained. (36 ref)—*Journal abstract*.

4754. Meyer, Joachim E. (U Gottingen, W Germany) **Death and neurosis.** (Trans M. Nunberg). New York, NY: International U Press, 1975. xii, 147 p.—Examines man's attitude toward and dying and its implications for the genesis of neurosis. Socioeconomic data on how people of various ages view death are presented, and the differences in attitudes toward death of the major philosophies are examined. (12 p ref)

4755. Miller, Robert T. (Ed). **International perspectives on childhood psychosis: I. A Soviet view with critiques and reactions.** *International Journal of Mental Health*, 1973-1974(Fal), Vol 2(3-4), 3-216.—Presents a paper by M. Sh. Vrono describing a major clinical study conducted at the Institute of Psychiatry in Moscow, and discussing its results and the theoretical conclusions based on them. A descriptive analysis is offered of 200 cases of childhood and adolescent schizophrenia, studied longitudinally with final follow-up 5-20 yrs after admission. Cases are discussed by age groups, by age onset and type of onset, by course of the illness, and by outcome; numerous variants in each type and subtype are mentioned. Vrono and other Soviet psychiatrists view childhood schizophrenia as a single nosological entity, a subtype of adult schizophrenia. Age at onset is regarded as a key factor in the clinical picture and prognosis. 5 non-Soviet psychiatrists (from Argentina, England, the Netherlands, France, and Japan) present critiques of Vrono's study. These comments and reactions raise questions about Vrono's classification, diagnostic criteria, assumptions, and methods, and conflicts between his findings and those of other researchers. Contrasting experiences and conflicting theories are discussed. —A. H. Alawi.

4761. Nissen, G. (Städtische Klinik für Kinder- und Jugendpsychiatrie Wiesengrund, Berlin, W Germany) [Disguised depressions in children?] (Germ) *Acta Paedopsychiatrica*, 1975, Vol 41(6), 235-242.—Argues that only from the viewpoint of adult psychiatry can children's depressive conditions manifesting themselves mainly in psychosomatic forms be classified as "disguised" depressions. These are viewed as genuine primary depressions, difficult to diagnose because of their symptomatology, which is characteristic of childhood. Retro- and prospective investigations, meant to identify behavior disorders in childhood as precursors, or as 1st stages of affective psychoses, have been unsuccessful. There is a considerable numerical discrepancy between the information derived from adult depressive patients and observations made by child psychiatrists with regard to the frequency of endogenous stages in children. Until now, this has not been satisfactorily explained. Prognosis is considered poor if treatment is not given at an early stage. (33 ref)—G. Rubin-Rabson.

4762. Novosel, Marija et al. (Inst for Health Protection of the Socialist Republic of Croatia, Zagreb, Yugoslavia) **The socio-economic status of schizophrenic patients.** *Socijalna Psihijatrija*, 1975, Vol 3(1), 33-38.—Suggests that socioeconomic status (SES) may be a crucial variable for observing the natural course of schizophrenia. Using questions from a study of SES in psychiatric patients by A. Barath, SES characteristics of 88 schizophrenic patients were determined. When the original 12 questions (having to do with education, occupation, household income, household facilities,

number of rooms, furniture, and maintenance) were used on these 88 Ss, it was found that almost the same results could be obtained with only 6 questions. Statistical procedures for this study are detailed. (Yugoslavian summary)—*Journal abstract*.

4763. Odegard, Ormolv. (Gaustad Psychiatric Hosp, Oslo, Norway) **Morbidity and social mobility in an upper class educational group.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 36-48.—Approximately 18,000 19-yr-old graduates from the high schools of Norway were followed for 50 yrs after graduation by means of a national case register of hospitalized psychoses. 668 graduates were found to have been admitted to a psychiatric institution. The admission rate for male graduates was found to be 95.7% of the expected rate, while for the female sex the percentage was 115.8. In both sexes, the number of manic-depressive cases was higher than the national average, while schizophrenia was rarer. The number of admissions related to alcohol or drug addiction was much higher in the graduates, and these admissions were concentrated mainly among members of the medical professions. A detailed study was made of 450 male and 218 female graduate patients for whom information was available about the occupation of the father as well as that of the graduate himself. The hospital admission rate was significantly higher in the graduates who had an occupation lower than that of their fathers, and vice versa. Within each social group, the rate of admission was highest in the graduates who had remained in the same occupation as their fathers. It is suggested that intergenerational change of occupation is associated with a lowering of psychiatric morbidity. High admission rates were found in groups which can be regarded as relative failures in relation to their level of aspiration (or that of their parents) in going to high school.—*Journal abstract*.

4764. Olatunbosun, D. A.; Akindele, M. O.; Adadevoh, B. K. & Asuni, T. (U Ibadan, Nigeria) **Serum copper in schizophrenia in Nigerians.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 119-121.—Determined serum copper concentrations by atomic absorption spectrophotometry in 102 schizophrenic patients and 95 healthy control Ss. Concentrations were significantly higher ($P < .001$) in schizophrenics than in controls. The average serum copper in schizophrenic females was higher than in schizophrenic males, but the difference was not statistically significant.—*Journal abstract*.

4765. Pershad, Dwarka & Dubey, B. Lal. (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **Some experience with a memory test in the aged cases.** *Indian Journal of Psychology*, 1974, Vol 49(4), 305-312.—150 clinic patients over 40 yrs of age and suffering from weakness, headache, and minor pains were administered the Wechsler Memory Scale (Form I) to determine the scale's internal consistency and the effects of age and sex on its performance. Results raise doubts about the internal consistency of the scale in Ss over 40 yrs of age. Performance of those in the 7th decade of their lives was not much different from that of those in their 5th decade. Mean performance of females was significantly lower than that of males in the same age group on Personal and Current Information and Visual Reproduction subtests. There was no significant

difference between the mean memory-quotient points of males and females. (16 ref)—*Journal abstract*.

4767. Pilowsky, Issy & Spence, Neil D. (Royal Adelaide Hosp, Australia) **Hostility and depressive illness.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1154-1159.—Employed a method of classification based on "information measure" taxonomy to investigate an aspect of hostility in nonendogenously depressed, endogenously depressed, and nondepressed patients. Ss were 68 inpatients with an average age of 41 yrs. Results show that there are no statistically significant differences between the 3 groups as such, but that a patient's self-rating of anger is substantially related to his position on the endogenous-nonendogenous depression dimension. The greater the anger score, the more likely the patient is to present a depressive syndrome of a nonendogenous type. Results support previous findings and prompt certain tentative theoretical speculations. (36 ref)—*Journal abstract*.

4768. Podnieks, Ints & Lovett Doust, J. W. (U Toronto, Clarke Inst of Psychiatry, Canada) **Spontaneous rhythms of perceptual motor performance in intact and damaged brain of man.** *Biological Psychology*, 1975(Nov), Vol 3(3), 201-212.—Administered a simple 15-sec maximal speed tapping task every min for 20 min to 69 normal 7-63 yr old Ss and to 53 7-79 yr old patients with mental disorders in 6 diagnostic categories including mental retardation. Age and diagnosis, but not gender, were significant variables. Autocorrelation analysis of the results revealed the existence of spontaneous ultradian cycles of recurrence for all Ss, the frequency and amplitude of which discriminated the healthy Ss and only nonorganic patients from patients with organic neurological deficits. "Scatter" scores representing deviations about the mean tapping scores showed similar cyclic characteristics. The relationship between these cycles of motor performance and neural clock controlling perception is discussed. (18 ref)—*Journal abstract*.

4769. Raskin, David E. (U Washington, Harborview Medical Ctr, Seattle) **Bleuler and schizophrenia.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 231-234.—Summarizes selected textbook accounts of E. Bleuler's theory of schizophrenia and examines some of the major issues which Bleuler discusses in his book *Dementia Praecox*.

4770. Reilly, Frank et al. (Yale U, Medical School) **Looseness of associations in acute schizophrenia.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 240-246.—To investigate looseness of associations and other theoretically relevant variables of speech pathology, 51 acute psychiatric patients, including 26 schizophrenics, were studied at the acute phase of their disorder by means of a free verbalization interview. Results show the following: (a) There were clear differences between the schizophrenic patient group and the controls, with the overall index of deviant verbalizations being significant ($p < .001$). (b) Many types of looseness were found in nonschizophrenic patients as well as in schizophrenics. Except however, the variants of

very looseness were strikingly more frequent in occurrence and severe in degree in the schizophrenics. Except at the very modest levels, however, the variants of overt looseness were strikingly more frequent in occurrence and severe in degree in the schizophrenic group (p = .01). (c) Gaps in communication, vagueness of ideas and blocking though present to some degree in controls, were much more common in the schizophrenic group (p = .001). (d) In controls, private meanings (including neologisms), repetition, and perseveration were extremely rare and current delusional thinking virtually nonexistent. Private meanings and current delusional thinking were conspicuously present in schizophrenics, repetition and perseveration were present to a mild degree in this acute schizophrenic sample. (e) Schizophrenic patients tended to show more looseness of associations when faced with a request to talk about topics not related to their illness. *Journal abstract*

4778. Scott, Judith & Gaitz, Charles M. (Texas Research Inst of Mental Sciences, Houston) **Ethnic and age differences in mental health measurements.** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 389-393. —Used T. S. Langer's 22-item screening scale of psychiatric symptoms to study ethnic and age differences in mental health among 1,441 White, Black, and Mexican-American adults in 2 socio-economic groups (working class and lower-middle class) and 6 age groups (ranging from 20-29 to 75-94). Anglos reported significantly more symptoms, those related to anxiety, than either of the 2 minority groups at each age level. A small, but significant, trend toward an increase in symptoms related to depression with age was noted. Anglos expressed more affect of both types (positive and negative), followed by Mexican-Americans, with the least expression of both dimensions by Blacks. Younger Ss consistently expressed more positive and negative affect than the 2 older groups. —L. Gorsev.

4779. Serra, Adriano V. & Pollitt, John. (U Coimbra, Serviços de Psiquiatria, Portugal) **The relationship between personality and the symptoms of depressive illness.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 211-218.—The Maudsley Personality Inventory and the Beck Depression Inventory, with additional items to assess depressive functional shift features and outlook on life values, were administered to 100 patients diagnosed as suffering from depressive illness. Patients' scores for questions eliciting information about symptoms assumed to be dependent on personality correlated at substantial and significant levels with Neuroticism (N) scale scores of the Maudsley Personality Inventory. Similar levels of correlation were found for the added items for assessing life values. Items believed to assess changes in functions independent of personality, such as the features of the depressive functional shift, showed no correlation with either N or E (Extraversion) scales of the Maudsley Personality Inventory, while demonstrating a substantial level of correlation with the depression scale. It is concluded that whereas changes in innate biological functions independent of environment are direct indications of the depressive illness process, psychological symptoms of the illness may reflect changes in personality dependent on upbringing, education and cultural background, thereby producing greater variation in this group of psychological symptoms. (16 ref)—*Journal abstract*.

4780. Siciliani, Orazio; Schiavon, Michele & Tansella, Michele. (U Verona, Psychiatric Clinic, Italy) **Anxiety and EEG alpha activity in neurotic patients.** *Acta Psychiatrica Scandinavica*, 1975(Aug), Vol 52(2), 116-131.—Reviews the literature on EEG alpha activity in different psychological states (i.e., morbid anxiety,

attention, and mental relaxation). In the present study, 20 male neurotic inpatients suffering from chronic moderate anxiety were assessed with respect to anxiety level and EEG alpha activity (frequency and per cent time) and fast activity. No significant EEG asymmetry was found. The average alpha per cent time was very low, most of the patients being low-alpha Ss. Anxiety and alpha index were significantly correlated. Ss were then treated with either 80 mg/day of temazepam or placebo for 2 wks (double blind). Significant effects were detected in anxiety state, the drug group showing more improvement, but not in EEG profile. The measures were expressed as change scores from the pretreatment values, and correlations between them were computed. The only correlation of significance was negative, between anxiety level and alpha index found after 1 wk in the drug group. (66 ref)—*Journal abstract*.

4781. Singh, S. B. & Srivastava, J. R. (GSVM Medical Coll, Kanpur, India) **Study of neurotic trends in the mothers of problem children.** *Indian Journal of Applied Psychology*, 1973(Jul), Vol 10(2), 75-79.—Compared the neuroticism scores of 15 mothers of problem children, 15 mothers of diseased children, and 15 mothers of normal children. All Ss were given the Hindi version of the Neuroticism Scale Questionnaire. Results indicate that only 27% of mothers of normal children were classified as neurotic, whereas 87% of the mothers of problem children and 40% of the mothers of diseased children were classified as neurotic. Not a single mother among the mothers of problem children was indicated to be cheerful.—R. P. Butler.

4782. Smith, Gudmund J.; Sjöholm, Lena & Nielzen, Sören. (U Lund, Sweden) **Individual factors affecting the improvement of anxiety during a therapeutic period of 1½ to 2 years.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 7-22.—Studied 30 neurotic outpatients suffering from pronounced anxiety before and after a therapeutic period of 1.5-2 yrs. Ss were described by means of a battery of rating scales and 2 percept-genetic methods, the Meta-Contrast Technique and the Afterimage Apparatus. It was possible to associate original status with improvement or non-improvement of manifest anxiety. The most positive prognostic sign was sensitivity to marginal (inner and outer) cues, whereas the most negative signs were prepsychotic discontinuities, projection, and lack of defense mechanisms.—*Journal abstract*.

4783. Stephens, D. A. et al. (St George's Hosp, Morpeth, England) **Psychiatric morbidity in parents and sibs of schizophrenics and non-schizophrenics.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 97-108.—Compared the psychiatric morbidity occurring in 332 close relatives of patients showing nuclear forms of schizophrenia with that of a control group of 201, and considered the findings in relation to the concept of the schizophrenic spectrum and to some genetic theories of schizophrenia. About 1/3 of each group were interviewed by a psychiatrist using defined diagnostic criteria, and information of varying degrees of completeness was obtained about the remainder. After considering possible biases, it was concluded that the "spectrum disorders" most likely to be biologically related to schizophrenia were personality disorders of nonneurotic type, either

alone or in combination with another diagnosis. Results, however, do not fit well with the model of dominant inheritance of schizophrenia and schizoid disease proposed by L. L. Heston (see PA, Vol 45:10373). (18 ref)—*Journal abstract*.

4784. Subotnik, Leo. (VA Hosp, Psychology Service, St Cloud, MN) **Spontaneous remission of emotional disorder in a general medical practice.** *Journal of Nervous & Mental Disease*, 1975(Oct), Vol 161(4), 239-244.—Retested 67 patients (mean age, 51 yrs) in a general medical practice who had scored above a cut-off point on the Cornell Medical Index Health Questionnaire indicating emotional disorder. The 59 respondents who had had no formal psychotherapy were grouped according to length of time lapsed since their 1st questionnaire: less than 12 mo (8 patients), 12-23 mo (9 patients), 24-35 mo (12 patients), 36-47 mo (21 patients), and 48 or more mo (9 patients). An analysis of variance showed no significant test-retest differences for length of time elapsed. A further analysis eliminating older patients showed a test-retest difference (possibly due to a regression artifact), but no effect of length of time elapsed. (32 ref)—*Journal abstract*.

4785. Supprian, Ulrich. (U Hamburg, Psychiatrische Universitätsklinik, W Germany) **[The chronopathological structure of diurnal variation in depressive illness.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 9-22.—2 cases of manic-depressive illness (only one is reported completely) were investigated over a period of 10 days at hourly intervals using self-rating scales. The time structure of diurnal variation and of variations from day to day, represented with a mood score and a drive score, are related to a theoretical concept of the course of cyclothymia. Findings indicate diurnal variation has no constant pattern; there are variations from day to day that closely follow the periodic changes in the mood- and drive systems; these changes have a high degree of autonomy and are not diurnally organized. The sleep- and wake periodicity remain diurnal and autonomic. The time structure of diurnal variation in depressive illness is considered to result from a compromise between these 2 regions of autonomy. (19 ref)—*English summary*.

4787. Teoh, Jin-Inn; Soewondo, Saesmalijah & Sidharta, Myra. (U Malay, Kuala Lumpur, Malaysia) **Epidemic hysteria in Malaysian schools: An illustrative episode.** *Psychiatry*, 1975(Aug), Vol 38(3), 258-268.—Discusses the prevalence and characteristics of epidemic hysteria among predominantly rural Malay schools. The interaction of psychological, religious, cultural, and sociological factors in the outbreak of hysteria is described. A specific outbreak is analyzed, and the impact of social change on epidemic hysteria is noted. (21 ref)—R. Tomasko.

4788. US-United Kingdom Cross-National Project. **The diagnosis and psychopathology of schizophrenia in New York and London.** *Schizophrenia Bulletin*, 1975(Win), No 11, 80-102.—Describes the general direction, structure and personnel, historical develop-

ment, strategies, samples, procedures, and preliminary findings of the Cross-National Project for the Study of the Diagnosis of Mental Disorders in the United States and the United Kingdom, which began in 1965 and is being carried out by multidisciplinary teams in New York and London. Hospital studies, videotape studies, case record studies, and diagnostic studies are outlined. Overall findings show that (a) American psychiatrists in general applied the diagnosis of schizophrenia to a much wider variety of clinical conditions than did their British counterparts; (b) that diagnoses routinely made in clinical practice cannot be relied upon in epidemiological studies, and (c) the use of descriptive psychopathology appears to be subject to distortion by systematic bias. Suggestions for achieving consensus on classification are presented. (2 p ref)—*L. Gorsev.*

4789. **Udin, Gene (Ed).** (Louisiana State U, Medical School) **Schizophrenia: Biological and psychological perspectives.** New York, NY: Brunner/Mazel, 1975. xvi, 144 p. \$8.95.

4790. **Vrono, M. S.** (Inst für Psychiatrie der Akademie der medizinischen Wissenschaften, Moscow, USSR) **[Some peculiarities of depressions in childhood schizophrenia.]** (Germ) *Acta Paedopsychiatrica*, 1975, Vol 41(6), 218-223.—Although specific depressive phases in small children seldom appear, endogenous depressions are observable. Their peculiarities have been inadequately studied. Even from observations on selected material, it is clear that in comparison with other psychotic syndromes, depressive symptoms are often seen. As in adults, 2 forms are apparent: simple, limited depression and the more complicated form accompanied by anxiety and excitement. Contrary to the depressions in adults, the affect of sadness was not apparent; dullness, moodiness, and whining prevailed, as well as vegetative disorders. The 1st form corresponds with the depressive-paranoid syndrome in adults; the agitated form finds expression in jactations or in raptus melancholicus. Suicidal ideas and tendencies are rare. These forms are acute or subacute as distinct from the inhibited depressions which develop slowly. Most frequent are polymorphous conditions, in which emotional disturbances are accompanied by neurosis-like, hypochondriacal, and delusional symptoms. Differential diagnostic difficulties originate from the fact that the depressive states are accompanied by exogenous and endogenous damage and from the isomorphism characteristic of children. The side effects of psychopharmacological drugs manifest themselves in the depression.—*G. Rubin-Rabson.*

4791. **Vujošević, Krsto & Kapor, Gojko.** (Army Medical Academy, Belgrade, Yugoslavia) **[Acute psychogenic reactions in soldiers.]** (Yugo) *Socijalna Psihijatrija*, 1975, Vol 3(1), 49-54.—Examined 60 hospitalized soldiers with different forms of dissociative reactions. Most had personalities with late adolescent problems, were emotionally immature, and on the average, were of somewhat low intellectual levels. Results suggest that the dominant forms of dissociative reactions are psychogenic attacks and that, most frequently, these are transitory, superficial reactions provoked by situational factors.—*English summary.*

4792. **Wells, Charles E.** (Vanderbilt U, Medical School) **Transient ictal psychosis.** *Archives of General*

Psychiatry, 1975(Sep), Vol 32(9), 1201-1203.—Transient psychotic episodes may result from continuous cerebral epileptiform discharges unaccompanied by clinically observed seizures. Such episodes may mimic depressive, hysterical, and schizophrenic psychosis and delirium. 2 patients are described and 8 patient histories from the literature are reviewed.

4793. **Wetzel, Richard D.; Reich, Theodore; McClure, James N. & Wald, Jeffrey A.** **Premenstrual affective syndrome and affective disorder.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 219-221.—Tested the hypothesis that there is a relationship between the reporting of premenstrual affective symptoms and the later development of clinically important affective disorder. 589 out of 874 freshman and sophomore university females responded to questionnaires about premenstrual and menstrual symptoms. They differed from those not returning the questionnaires only in year of school. As predicted, Ss reporting premenstrual affective symptoms were more likely than those who did not report them to seek psychiatric care at the school's student health service and to be diagnosed as affective disorder at the service.—*Journal abstract.*

Behavior Disorders & Antisocial Behavior

4794. **Adams, Kenneth M.; Rennick, Phillip M.; Schoof, Kenneth G. & Keegan, John F.** (McMaster U, Medical Ctr, Hamilton, Canada) **Neuropsychological measurement of drug effects: Polydrug research.** *Journal of Psychodetic Drugs*, 1975(Apr-Jun), Vol 7(2), 151-160.—Gave a complete neuropsychological assessment to 51 discharged polydrug-treatment program inpatients (mean age, 26.7 yrs) using a modified Halstead-Reitan test battery. The battery was administered 4 times during hospitalization. Results suggest that multiple drug use causes cerebral dysfunction in some people. A methodology for the measurement of reversible drug effects and suggestions for treatment based on the patient's cognitive style are presented.—*R. Tomasko.*

4795. **Alvy, Kerby T.** (Ctr for the Improvement of Child Caring, Los Angeles, CA) **Preventing child abuse.** *American Psychologist*, 1975(Sep), Vol 30(9), 921-928.—Discusses 2 general approaches to analyzing child abuse: a comprehensive approach which defines abuse as collective, institutional, and individual in nature; and a narrow approach which considers only individual abuse. The preventive implications of each are considered, and the relationships between theoretical formulations of the causes of individual physical abuse and preventive programs are discussed. The successful reinforcement of these programs is seen as a necessary step to raise public consciousness about all forms of individual as well as collective abuse. (43 ref)—*R. Tomasko.*

4796. **Atkinson, M. W.; Neil, Kessel & Dalgaard, J. B.** (University Hosp of South Manchester, Manchester, England) **The comparability of suicide rates.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 247-256.—Argues that programs of suicide prevention require accurate epidemiological surveys for their planning. Doubt has been cast on the accuracy of many existing surveys because of the realization that suicide is underreported and because of the lack of consistency in the procedure for suicide ascertainment. 2 studies of the

problem are described. In Study 1, a comparison of Denmark and England, it is shown that there are striking differences in suicide ascertainment procedure between the 2 countries. On a blind basis, coroners and their opposite numbers in Denmark examined a sample of each other's case records. It was found that the Danes consistently reported more suicides than did the English coroners on the same case material; thus considerable doubt is cast on the supposed difference in suicide rates between the 2 countries. In Study 2, deaths by poisoning were examined for selected coroners' districts in England and Wales. It is shown that there was considerable variation from one district to another in the relative proportions of these deaths which achieved an accident, an open, or a suicide verdict. This suggests that in England and Wales coroners may not be consistent in their suicide ascertainment criteria. It is concluded that hypotheses attempting to account for differences in suicide rate based on such epidemiological surveys should be viewed with great caution. (17 ref)—*Journal abstract*.

4797. **Bernard, Frederic.** (Private practice, Rotterdam, Netherlands) **An enquiry among a group of pedophiles.** *Journal of Sex Research*, 1975(Aug), Vol 11(3), 242-255. —Discusses sociological data obtained from questionnaires from 73 pedophiles.—*E. B. Jaffa*.

4798. **Blazer, Dan G. & Haller, Lee.** (Duke U, Medical Ctr) **Pentazocine psychosis: A case of persistent delusions.** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 404-405.—Reports a case of psychosis secondary to pentazocine use in a 29-yr-old male. The patient demonstrated hallucinations, perceptual aberrations, a distorted body image, and delusional thinking. This delusional ideation persisted for 3 wks. The persistence of the psychotic thought processes in this patient suggests that pentazocine acts as a triggering mechanism in some cases, but also that the continuation of the psychosis may be dependent on other factors (e.g., biochemical or stress variables).—*L. Gorsey*.

4799. **Bostock, Tudor & Williams, Christopher L.** (Kippax Health Ctr, Holt, Australia) **Attempted suicide: An operant formulation.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 107-110. Presents an alternative formulation of attempted suicide in which the phenomenon is considered within the context of social learning theory. Suicidal behavior is viewed as an operant which is reinforced and maintained by the consequent interpersonal contingencies. The modification of the suicidal behavior then involves alteration of the contingent consequences. This theoretical formulation is elaborated, and treatment principles are outlined. (32 ref)—*Journal abstract*.

4800. **Briedis, Catherine.** (McGill U, Montreal, Canada) **Marginal deviants: Teenage girls experience community response to premarital sex and pregnancy.** *Social Problems*, 1975(Apr), Vol 22(4), 480-493. Describes how marginal deviants view the discrepancy between anticipated and experienced response by the community to disapproved activity. The problematic nature of reaction is illustrated, and the way community response is transformed in the process of discovery. (20 ref)—*S. L. Warren*.

4801. **Charles-Nicolas, A.-J.** (Centre Marmottan, Paris, France) [On the identification of the drug-addict.] (Fren) *Annales Médico-Psychologiques*, 1975(May), Vol 1(5), 605-616.—The problems met in defining the field of drug addiction are both theoretical and practical. Self-medication, usually by pill-taking, is at a high level today even among conservative members of society. For socially marginal or drug-addicted populations, the practice is so marked as to blur classifications that could be made were it not for poly-drug use. The criteria best defining addiction appear to be a progressive increase in the dose employed and the presence of an evident psychologic tropism (i.e., having a primary effect on subjective state. An increased dose of a nonpsychotropic product would be considered a matter of hypochondria rather than drug addiction). All drugs taken in nonmedical use label the user as drug-addicted. It is the hallucinogens which, despite an absence of physical dependency, most challenge the definition of addiction proper. The self-administration of hallucinogens is so often ritual in nature, and so often carries transgressive significance, that it seems best to classify habitual users of them as being more sociopathic than psychopathic. The question they pose for definition is a difficult one, however, principally because users emerge from the same subcultural environment that regularly produces the classical addiction to heroin. From the user's point of view, the societal label of "addict" is more acceptable than "crazy," and the abuse of psychotropic substances carries a double psychological significance (viz., defense against both intrapsychic and social sources of pain).—*H. E. King*.

4802. **Chilton, Roland & DeAmicis, Jan.** (U Massachusetts, Amherst) **Overcriminalization and the measurement of consensus.** *Sociology & Social Research*, 1975(Jul), Vol 59(4), 318-329.—535 college and high school students estimated the seriousness of selected offenses in an attempt to examine labeling and overcriminalization. Responses suggest that offenses involving victimization are more uniformly assessed as serious than victimless crimes. Findings (a) indicate substantial lack of agreement on the seriousness of drug use of all kinds, (b) provide support for the emphasis placed on distinguishing victimizing offenses from victimless offenses, and (c) raise the possibility of important age-group variation in assessments of seriousness. Improved measurement procedures and their use are suggested for the resolution of a series of questions raised by the labeling perspective. (16 ref)—*R. V. Heckel*.

4803. **Choi, Sei Y.** **Death in young alcoholics.** *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1224-1229.—A survey of the records of 45 deceased alcoholics (average age at death, 41.8 yrs) treated at an outpatient alcoholism clinic over a 3-yr period showed that homicide, accidents, and heart disease were the leading causes of death. Suggestions for preventing death in relatively young persons are presented.

4804. **Coppolillo, H. P.** (Vanderbilt U, Medical Ctr, Div of Child Psychiatry) **Drug impediments to mothering behavior.** *Addictive Diseases: An International Journal*, 1975, Vol 2(1-2), 201-208.—Argues that the necessary and sufficient cause for vulnerability to addiction is in the psychological pathology of the individual and that

this pathology originated from developmental problems. A model is presented describing the impediments to mothering which occur in female addicts and which predispose subsequent generations to vulnerability to addiction.

4805. **Dahlgren, Lena.** (Karolinska Hosp, Clinic of Alcoholic Disease, Stockholm, Sweden) **Special problems in female alcoholism.** *British Journal of Addiction*, 1975(Apr), Vol 70(Suppl 1), 18-24.—Considers reasons for alcoholism being less common among women and having varying occurrence rates in different countries. Clinical studies are reviewed to evaluate the claim that female alcoholics show more psychic deviation than male alcoholics, with deeper character changes, a more quickly developed alcohol dependence, loss of control, and somatic complications. Cultural problems which female drinkers have in integrating this habit into their social life are seen resulting in a guilt complex and a serious conflict between their womanhood and alcohol. Treatment approaches for female alcoholics are discussed.—*R. Tomasko.*

4806. **Dandurand, Yvon.** **Training school wards running away from after-care placement.** *Canadian Journal of Criminology & Corrections*, 1975(Oct), Vol 17(4), 292-306.—Studied 136 cases of running away involving 54 female and 36 male juveniles 14-17 yrs old, in an attempt to construct a typology of the situation in terms of the seriousness of the consequences. Findings are reported in detail and indicate that the AWOL situation is much more complex than it is generally believed to be. (French abstract) (32 ref)—*B. L. Kintz.*

4807. **Danneel, R.** (U Bonn, Zoologisches Inst, W Germany) **[The supposed relationship between suicide and date of birth.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 23-25.—No relationship between frequency of suicide and month of birth or zodiac sign was observed in 592 cases of suicide in the province of Nordrhein-Westfalen, Germany, during 1971. The reports of some authors about this relationship are considered due to errors or incorrect interpretation of their results.—*English summary.*

4808. **Deardorff, C. Melvin; Melges, Frederick T.; Hout, Carolyn N. & Savage, D. Jane.** (Stanford U) **Situations related to drinking alcohol: A factor analysis of questionnaire responses.** *Journal of Studies on Alcohol*, 1975(Sep), Vol 36(9), 1184-1195.—Studied emotional and behavioral patterns related to customary social and self-defeating patterns of alcohol consumption. Problem drinkers included 45 patients in a residential alcoholism treatment program, 8 male outpatients in a treatment program for those with a history of violence associated with alcohol use, 82 outpatient alcoholism treatment patients, and 118 outpatients at a county treatment program who had been referred after a conviction of "driving while intoxicated." The nonproblem drinkers included 67 spouses of problem drinkers, 22 staff members of the treatment facilities, and 43 college students. Ss completed the Situations for Drinking (SIT) questionnaire, a series of 48 statements that linked a subjective frequency estimate of drinking to situations, and the Power Orientation Semantic Differential (POSD), a 26-item questionnaire on how they perceived themselves in terms of power dimensions. Factors

distinguishing problem and nonproblem drinkers are discussed, and the validity of the SIT and POSD measures is examined.—*Journal abstract.*

4809. **Duke, Marshall P. & Fenhagen, Eulalie.** (Emory U) **Self-parental alienation and locus of control in delinquent girls.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 103-107.—Administered the Nowicki-Strickland Locus of Control Scale for Children and the Comfortable Interpersonal Distance (CID) Scale to 18 adolescent females in a detention unit of a county juvenile court and to 20 nondelinquent controls. Stimuli used on the CID were boyfriend, mother, policeman, father, and girlfriend. Delinquent girls were more external than the nondelinquent controls and also preferred greater distances from the CID stimuli, particularly in relation to parental figures. Implications for the rehabilitation of delinquents are noted. (22 ref)—*L. Gorsey.*

(24 ref) *S. Blackman.*

4812. **Gardner, A. R. & Gardner, A. J.** (Friern & Royal Free Hosp, London, England) **Self-mutilation, obsessiveness and narcissism.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 127-132.—Conducted a controlled study of the clinical and biographical features of 22 female repeated self-cutters. Ss were randomly selected nonpsychotic inpatients. Results of assessment of Ss, using the Middlesex Hospital Questionnaire and the Obsessive-Compulsive section of the Tavistock Inventory, is presented. The marked obsessiveness of the Ss is emphasized, and possible implications of findings for treatment are discussed. (15 ref) *Journal summary.*

4813. **Glatt, M. M.** (St Bernard's Hosp, Regional Alcoholism & Drug Dependence Unit, Middlesex, England) **Today's enjoyment—tomorrow's dependency: The road towards the rock-bottom and the way back.** *British Journal of Addiction*, 1975(Apr), Vol 70(Suppl 1), 25-34.—Presents a chart of the stages of alcoholism useful for diagnosis and treatment. 5 developmental phases are described: the prealcoholic phase, the prodromal phase characterized by alcoholic amnesia, the crucial phase related to loss of control, the chronic phase with a bottoming-out experience, and the rehabilitative phase. Short-cuts to an early bottoming-out are illustrated. The applicability of the chart to other forms of addiction, including tobacco and drugs, is suggested. (21 ref)—*R. Tomasko.*

4814. **Goldney, Robert D.** (U Adelaide, Royal Adelaide Hosp, Australia) **Out-patient follow-up of those who have attempted suicide: Fact or fantasy?** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2),

111-113.—46% of patients who had attempted suicide and were referred to the outpatient clinic of the Royal Adelaide Hospital failed to attend. Similar findings have been reported from other centers. Though it is not known why this is so, tentative speculation is possible. Those who do not attend may have already benefited from the incident and the attention received. There may be, however, ambiguity in the referral which discourages patients from attending. The need for further study of nonattendance of these patients is emphasized, since it has been shown that persons who attempt suicide are more at risk for suicide in the future. (21 ref)—*Journal abstract*.

4815. Goldsmith, Lisa A. (City U New York) **Adaptive regression, humor and suicide.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1275-1276.

4816. Hepburn, John R. (U Missouri, St Louis) **The role of the audience in deviant behavior and deviant identity.** *Sociology & Social Research*, 1975(Jul), Vol 59(4), 387-405.—Examines the interactionist approach which explicitly recognizes the actor as a viable force in the emerging definition of deviance; the actor negotiates with an audience which may include official deviance-designators, significant others, and self. Because deviance is a perceived violation of rules subjectively defined or redefined as an actor encounters different interactional settings, it requires a more fluid level of analysis than that permitted by objective criteria of deviance. (67 ref)—*R. V. Heckel*.

4817. Hoenig, J. & Duggan, Elaine. (Memorial U Newfoundland, St John's, Canada) **Sexual and other abnormalities in the family of a transsexual.** *Psychiatry Clinica*, 1974, Vol 7(6), 334-346.—Details a case of transsexualism in a 17-yr-old male with homosexuality of Kinsey type 6. In his maternal kinship were found a large number of persons with various types of sexual abnormalities, including 1 case of probable transsexualism. The pattern of intermarriage produces from generation to generation an increasing number of children with such abnormalities. The patient and a number of relatives also show epilepsy. That disorder seems to exist mainly in the paternal kinship, and the coexistence of transsexualism and epilepsy seems coincidental. —*Journal abstract*.

4818. Huff, C. Ronald & Scott, Joseph E. (U California, Irvine) **Deviance and cognitive consistency: Patterns in public attitudes toward deviance.** *Sociology & Social Research*, 1975(Jul), Vol 59(4), 330-343.—Labeling theory has generated much research, but the question of its relationship to cognitive consistency theory has been neglected. To test that relationship, 1,093 respondents were asked about their attitudes toward and knowledge of sexual "deviance" and related public policy. Data are interpreted as supporting the hypothesis that attitudes toward deviance are patterned. The discrepancy in conclusions between this study and another with nearly identical data is attributed to differential methods of data analysis. Results suggest that public attitudes toward deviance tend to be both cognitively consistent and surprisingly tolerant. (21 ref)—*R. V. Heckel*.

4819. Jayewardene, C. H. (U Ottawa, Canada) **Violence among the Eskimos.** *Canadian Journal of Criminology & Corrections*, 1975(Oct), Vol 17(4),

307-314.—Questions reports of Eskimo violence induced by alcohol or other factors, and the theories advanced to explain the alleged violence. Empirical evidence of Eskimo violence is lacking and the theories are speculative. (French abstract) (23 ref)—*B. L. Kintz*.

4820. Joesting, Joan; Jones, Nelda & Joesting, Robert. (Salisbury State Coll) **Male and female prison inmates' differences on MMPI scales and revised beta IQ.** *Psychological Reports*, 1975(Oct), Vol 37(2), 471-474.—Compared the MMPI protocols of all male ($n = 257$) and female ($n = 272$) prisoners in the North Carolina Correctional System in 1971. Female inmates had significantly higher ($p < .01$) IQs than did the males. With the exception of the *Ap*, *L*, and *K* scales, males had statistically significant higher means on all MMPI scales. Females were higher only on the *Ap* and *K* scales. The males appeared significantly more emotionally disturbed, which suggests that emotionally disturbed females may be admitted to a mental hospital, as a matter of policy, rather than to a prisoner.—*Journal abstract*.

4821. Judd, Lewis L. & Grant, Igor. (U California, San Diego) **Brain dysfunction in chronic sedative users.** *Journal of Psychodetic Drugs*, 1975(Apr-Jun), Vol 7(2), 143-149.—Presents neuropsychological findings for 50 14-54 yr old polydrug users as compared with 19 male adults judged neurologically intact and 19 with brain disorders. The examination included the Halstead test battery, a modification of the Halstead Wepman aphasia screening test, a sensory perceptual examination, the WAIS, and the MMPI. 25 of the polydrug users demonstrated cerebral dysfunction. Neuropsychological impairment was particularly associated with heavy use of CNS depressant drugs. Implications for drug abuse treatment are noted. (15 ref)—*R. Tomasko*.

4822. Kaplan, Stuart L. et al. (U Pennsylvania) **Correlations between scores on the Brazelton Neonatal Assessment Scale, measures of newborn sucking behavior, and birthweight in infants born to narcotic addicted mothers.** In N. R. Ellis (Ed), *Aberrant development in infancy: Human and animal studies*. Hillsdale, NJ: Lawrence Erlbaum, 1975. viii, 287 p.—Data from 23 infants born passively addicted to narcotic addict mothers show that (a) Brazelton irritability items distinguished between these Ss and normal controls; (b) Brazelton alertness items did not distinguish the 2 groups but did correlate with sucking measures; and (c) motor items also distinguished between the addict Ss and the normals and well correlated sucking measures.

4823. Leader, Elaine. (Cedars-Sinai Medical Ctr, Thailians Community Health Ctr, Los Angeles, CA) **Transsexualism: A study of cross-gender identity disorder.** *Clinical Social Work Journal*, 1975(Fal), Vol 3(3), 155-166.—Presents some of the current theoretical thinking regarding transsexualism. Gender identity and gender role are defined and distinguished from each other. Transsexualism, the most extreme of cross-gender disorders, is differentiated from transvestism. Observable manifestations of both disorders in childhood are pointed out. Even though psychotherapeutic treatment of adult transsexualism is considered to be unsuccessful, treatment suggestions are made for the professional who comes in contact with transsexuals. (23 ref)—*S. R. Stein*.

4824. Lerner, Steven E. & Linder, Ronald L. (San Francisco State U) **Birth order and polydrug abuse among heroin addicts.** *Journal of Drug Education*, 1975, Vol 5(3), 285-291.—Studied possible relationships between birth order and polydrug use patterns of 198 heroin addicts prior to undergoing treatment. Overrepresentation of only child heroin addicts was evident among the population studied.

4825. Liden, Craig B.; Lovejoy, Frederick H. & Castello, Catherine E. (Harvard U, Medical School, Boston) **Phencyclidine: Nine cases of poisoning.** *JAMA: Journal of the American Medical Association*, 1975(Nov), Vol 234(8), 513-516. In 9 cases of phencyclidine hydrochloride poisoning in patients aged from 10 mo to 26 yrs, early signs of overdose included drowsiness, nystagmus, miotic pupils, blood pressure elevation, increased deep tendon reflexes, ataxia, anxiety, and agitation. In more severe cases, seizures, spasticity, and opisthotonos were seen in addition to deep coma and respiratory depression. Treatment included removal by emetics or lavage, hydration, and a quiet, reassuring environment. Spasticity, agitation, and ocular manifestations responded to diazepam. Psychiatric intervention was instituted after the patients were stable and no longer agitated. (19 ref)—*Journal abstract*.

4826. Mahoney, John & Nay, W. Robert. (Virginia Commonwealth U, Academic Ctr) **The effect of sexual integration of a reform institution on adolescent females' perceptions of adolescent males.** *Journal of Genetic Psychology*, 1975(Sep), Vol 127(1), 13-20.—3 days prior to sexual integration of a residential school for delinquent adolescent females, 85 students were surveyed about their attitudes towards boys. Ss also completed a semantic differential (SD) for "myself," "boy," and "girl." Ss were assigned to 1 of 3 gender-identity groups for male identification, female identification, and uncertain identification based on SD profile matching. A 2nd survey was conducted 2 mo after sexual integration of the school. Data were obtained from 49 of the original Ss. Results show significant changes for the male identity group toward rejection of the male role. The uncertain identity group increased identification with the feminine role. As anticipated, no changes appeared for the female identity group. Findings suggest that sexual integration of adolescent reform institutions is effective in avoiding sex-role diffusion.—*Journal abstract*.

4827. Marković, Ante. (Medical Ctr, Dubrovnik, Yugoslavia) **[A study of attempted suicide.]** (Yugo) *Socijalna Psihijatrija*, 1975, Vol 3(1), 19-31.—Describes characteristics of suicide attempts in neuropsychiatric patients treated from 1962 to 1972. Of the 49 patients, twice as many were women as men. 79.5% were born outside the community. This finding and other residence data suggest an association between environmental changes and suicidal behavior. In a large number of patients, the premorbid personality developed psychoneurosis and depression of undetermined etiology; however, there was also a considerable number of patients in whom no significant psychopathologic phenomena could be detected. In all patients, the actual mental constellation was changed and there was a depressive symptomatology expressing itself as a general

"dissatisfaction with life." The need to find common pathogenic phenomena in attempted suicide cases is emphasized. (27 ref)—*English summary*.

4828. Mathew, Mohan. (Kerala U, Trivandrum, India) **A comparative study of aggression in juvenile delinquents, waifs, strays, and normal boys.** *Indian Journal of Applied Psychology*, 1973(Jul), Vol 10(2), 61-65.—Data were obtained on 15 Ss from each category by a semi-structured interview, Draw-a-Person Test, and 8 pictures modeled after the TAT. Results indicate that juvenile delinquents showed stronger and deeper aggressive behavior than did the other 2 groups. Findings also support the theory that aggression is a learned behavior which mainly takes place through interaction in the family. (20 ref)—*Journal abstract*.

4829. McDonald, Angus & Brown, Dick. (Clarke Inst of Psychiatry, Toronto, Canada) **American military deserters in Canada: The pre-Vietnam syndrome.** *Canadian Journal of Criminology & Corrections*, 1975(Oct), Vol 17(4), 315-325.—Presents demographic and psychological data on 38 American deserters in Canada. A number of the situational and emotional problems encountered by such expatriates are discussed. The data indicate that some were disturbed personalities before their military service but might have functioned adequately were it not for that experience, which pushed them over the edge. (French abstract)—*B. L. Kintz*.

4830. Monty, R. A.; Hall, R. J. & Rosenberger, Marjorie A. (US Army Human Engineering Lab, Behavioral Research Directorate, Aberdeen Proving Ground, MD) **Eye movement responses of heroin addicts and controls during word and object recognition.** *Neuropsychology*, 1975(Sep), Vol 14(9), 693-702.—In 2 experiments the eye movement responses of 23 heroin addicts and 23 matched university student controls were examined while they were engaged in word and object recognition tasks. Significant differences between the 2 groups were found which could be attributed to motivational or interest factors associated with the importance of the materials shown, and to basic differences in the physiological and CNS processes that regulate eye movements. Based on these findings, together with earlier observations of differences in cutaneous sensitivity between addicts and controls, it is hypothesized that addiction may lead to an altered sensory capacity in the temporal domain which is concerned with gating and subsequent scanning of stimuli. The potential role of educational differences between the 2 groups is also discussed.—*Journal abstract*.

4831. Norell, Kjell. (Inst for Social Medicine, Rikshospitalet, Oslo, Norway) **Attempted suicide and suicide in functional psychoses.** *Acta Psychiatrica Scandinavica*, 1975(Aug), Vol 52(2), 81-106.—A total of 2,243 1st admissions to Gaustad Hospital between 1938 and 1961 diagnosed as functional psychoses were either followed up to the time of their death within 5 yrs or observed over a period of 5 yrs, and then reexamined. Of these patients, 325 had attempted suicide prior to their admission. The frequency of attempted suicide was equal in both sexes. Males used more dangerous methods and had more serious intentions. The psychosis appears to have been of importance when considering whether, but not how, the suicide should be attempted. The greatest

risk of attempted suicide was among patients with psychoses of a depressive nature. 28 of the patients committed suicide within 5 yrs following their discharge, and a further 20 took their own lives prior to the reexamination.—*Journal abstract.*

4832. Offer, Daniel; Marohn, Richard C. & Ostrov, Eric. (Michael Reese Hosp & Medical Ctr, Chicago, IL) **Violence among hospitalized delinquents.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1180-1186.—Collected data on the extent of violent behavior among 55 male and female hospitalized juvenile delinquents during a period of 3 yrs. Violent behavior was correlated with the adolescent self-image and the ratings of staff and psychotherapists. Results show that violent male Ss had a healthier self-image and were more liked by their therapists than nonviolent male Ss. The opposite was found for females. Initially, the staff liked the nonviolent better; this finding was no longer significant after Ss were on the unit for 13 wks. Individual and staff psychodynamics and cultural factors that contribute to the outbreak of violence are discussed. (27 ref)—*Journal abstract.*

4833. Pokorny, Alex D.; Kaplan, Howard B. & Tsai, Shih Y. (Baylor Coll of Medicine, Texas Medical Ctr, Houston) **Hopelessness and attempted suicide: A reconsideration.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 954-956.—Administered measures of depression, hopelessness, and strength of suicidal intent to a sample of 112 suicide attempters. Ss were hospitalized at intervals that varied from a few hours to more than a week following the attempt. Results for the 55 Ss diagnosed as depressive and admitted within 72 hrs after their attempt were compared with results obtained by K. Minkoff et al (see PA, Vol 50:11549) using comparable measures. Contrary to findings of the earlier study, there was a lower correlation between hopelessness and intent than between depression and intent. It is suggested that demographic differences between the 2 samples may provide explanations for this discrepancy, in that they reflect the presence or absence of external societal supports that may influence the suicidogenic potential of hopelessness.—*Journal abstract.*

4834. Ramon, Shulamit; Bancroft, John H. & Skrimshire, Angela M. (U Bradford, School of Applied Social Studies, England) **Attitudes towards self-poisoning among physicians and nurses in a general hospital.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 257-264.—Interviewed 25 doctors and 50 nurses working in the medical wards of a general hospital. Ss were asked to indicate typical motives for self-poisoning and were then shown brief accounts of 4 typical case histories. They were asked to choose from a list of motives those they considered applied to each case. They then rated each motive for acceptability and understandability, and each case for sympathy and readiness to help. Motives were of 2 principal types:—"manipulative" (i.e., aimed at eliciting a response from others) and "depressive" (i.e., communicating despair and aimed at withdrawal, escape, or death). "Depressive" motives were more acceptable and evoked more sympathy or readiness to help in both doctors and nurses than "manipulative" motives. Doctors and nurses differed in various ways. Nurses were generally more accepting, more sympathet-

ic, and more likely to seek professional help as an alternative way of coping. Doctors distinguished more clearly between "suicidal" motives, of which they were relatively accepting, and "manipulative" motives, which they accepted less. Attitudes to the 4 cases differed, primarily in the motives attributed. Those differences may also reflect differing severity of problems, personal responsibility for problems, social class, sex, or age.—*Journal abstract.*

4835. Rauchfleisch, Udo. (U Basel, Psychiatric Clinic, Switzerland) **[On the diagnostic significance of the "discrepancies" in Raven's Progressive Matrices Test.]** (Germ) *Diagnostica*, 1975, Vol 21(3), 107-115.—Examined data from the Rorschach, an intelligence test, the Rozenzweig Picture-Frustration Study, and questionnaires administered to 214 Ss 14-19 yrs old who exhibited behavioral disorders, to detect differences between Ss with high and low discrepancy scores on the Progressive Matrices. Of about 45 variables examined, 14 yielded significant T values. Closer examination of the 25 high-discrepancy Ss suggests more clearly a positive correlation between degree of discrepancy and distractibility, lack of efficiency, and related variables.—*M. Morf.*

4836. Roberts, Gustave W. (Texas Tech U) **Locus of control orientation in a broad sample of alcoholics.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 423.

4837. Rudman, Seymour L. (U Massachusetts) **The effect of gender on responsiveness to internal and external cues associated with eating behavior.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1759-1760.

4838. Rydberg, U. (Karolinska Inst, Stockholm, Sweden) **Present and future trends in alcohol research.** *British Journal of Addiction*, 1975(Apr), Vol 70(Supp 1), 3-11.—Stresses the importance of an interdisciplinary approach to the study of alcoholic behavior. Problems related to differences in scope and methodology, studying excess consumption in human Ss, and obtaining an adequate number of Ss, are considered. The importance of long-term planning and the use of longitudinal studies to understand etiological and pathogenic factors leading to alcoholism are noted. The influence of fads in the choice of topics in alcohol research is criticized. 4 action mechanisms of ethanol on the living organism are discussed, together with the concept of an acceptable daily intake.—*R. Tomasko.*

4839. Solway, Kenneth S.; Hays, J. Ray; Roberts, Thomm K. & Cody, Jo A. (Texas Research Inst of Mental Sciences, Houston) **Comparison of WISC profiles of alleged juvenile delinquents living at home versus those incarcerated.** *Psychological Reports*, 1975(Oct), Vol 37(2), 403-407.—Compared the WISC subtests and IQs of 91 juveniles living on a juvenile detention ward and 91 juveniles living at home. Ages ranged from under 10 to 15 yrs, and all Ss were alleged juvenile delinquents awaiting adjudication. No differences were found on either IQs or subtest standard scores between ward and home group. There were, however, significant differences among the subtests. A Newman-Keuls test indicated a grouping of the subtests which was different from that described by D. Wechsler (1958). The highest ranked

subtests were Similarities, Picture Completion and Object Assembly, the lowest ranked were Information, Vocabulary, and Arithmetic. Data indicate that the verbal-performance discrepancy is not useful to describe alleged juvenile delinquents.—*Journal abstract.*

4840. Sydulko, Karl et al. (Gateways Hosp, Los Angeles, CA) **Psychophysiology of sociopathy: Electro-cortical measures.** *Biological Psychology*, 1975(Nov), Vol 3(3), 185-200.—Analyzed the contingent negative variation (CNV), visual average evoked potential (AEP), and resting EEG in sociopaths and controls matched for age and sex. 27 male sociopaths were selected by psychiatric interview and psychometric tests (e.g., MMPI and the State-Trait Anxiety Inventory), restricted to Shipley Institute of Living Scale for Measuring Intellectual Impairment IQs of 115-145, and separated into young (mean age, 20.5 yrs) and older (mean age, 35.3 yrs) age groups. Ss participated in forewarned reaction-time tasks in which the imperative stimulus was either an innocuous or noxious tone that the S escaped by pressing a response key. Sociopaths and controls did not differ in reaction time, vertex and occipital AEP amplitude or latency, and power spectral density of the EEG. Contrary to previous findings, there also were no significant differences between sociopaths and controls in overall CNV amplitude or topography. However, while most controls showed increased CNV amplitude in the noxious tone condition as compared to the innocuous tone condition, older sociopaths showed no change or decreased amplitudes. 4846. Vasić, Uglješa; Kalićanin, Predrag; Petrović, Dušan & Veljković, Jovan. (Inst for Mental Health & Laza Lazarević Neuropsychiatric Hosp, Belgrade, Yugoslavia) **[Suicides and attempted suicides of psychiatric patients in Belgrade.]** (Yugo) *Socijalna Psihijatrija*, 1975, Vol 3(1), 11-18. Argues that inadequate recording, therapy, and prevention of attempted and completed

suicides hinder the development of a documented approach to these increasingly frequent phenomena. Data from the Institute for Mental Health in Belgrade obtained during 1963-1967 on all hospitalized neuropsychiatric patients who attempted suicide are presented. Specific data from the 222 patients (58 male and 164 female) who attempted suicide are presented and compared with findings from 20 former psychiatric patients who made successful suicide attempts. Information on sex, kind of treatment, age, education, occupation, marital status, diagnosis, and manner of suicide is included.—*English summary.*

4847. Weissman, Myrna M. (Yale U, Medical School, Depression Research Unit) **Wrist cutting: Relationship between clinical observations and epidemiological findings.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1166-1171.—Reports of select samples have described suicide attempt by wrist cutting as a unique clinical syndrome occurring in young, single, attractive women, associated with specific psychological characteristics. A St. Louis study of a large unselected sample found that persons who cut their wrists were similar to other suicide attempters and were not more apt to be single females who made repeated attempts. These findings are repeated in the present study with 273 suicide attempters seen at a medical center during a 25-wk period, suggesting that reports of persons cutting their wrists should be reconsidered in light of these epidemiologic findings. Institutional differences in patient sampling can account for lack of agreement. While clinical observations are important, additional study through epidemiologic approaches is necessary before conclusions about new syndromes can be made. (25 ref)—*Journal abstract.*

4848. Wilkins, R. H. (Manchester U, England) **The hidden alcoholic in general practice.** *British Journal of Addiction*, 1975(Apr), Vol 70(Suppl 1), 12-17.—Administered the Spare Time Activities Questionnaire to 546 15-64 yr old working-class outpatients suspected of being alcoholic risks. Ss were classified into 3 types: the heavy drinker, the problem drinker, and the alcohol addict. 28.4% of the Ss surveyed were present or past alcoholics, as compared to 2.8% of a 179-patient control group whose members had no alcoholic risk characteristics. Significant risk factors are also identified.—*R. Tomasko.*

4849. Wilson, Harriet. **Juvenile delinquency, parental criminality and social handicap.** *British Journal of Criminology*, 1975(Jul), Vol 15(3), 241-250.—Juvenile delinquency correlated highly with severe social handicap as measured by an instrument scoring father's occupation, size of family, adequacy of school clothing, school attendance, and parental contact with school in a sample of 182 children from 56 families. Juvenile delinquency also correlated with parental criminality. These results give independent confirmation of the last 3 of D. J. West's (1973) factors. Ability tests of the 6- and 10-yr-old males showed that the greater the degree of social handicap, the poorer the results. Parental behavior was significantly related to both delinquent and nondelinquent Ss' behavior. In a delinquent milieu, the only effective protection against delinquency appears to be a strict parental regime that limits their children's freedom

of movement. The quality of the home atmosphere and parental participation in the children's activities showed only a chance relationship.—*Journal abstract.*

4850. Wodarski, John S.; Feldman, Ronald A. & Pedi, Stephen J. (U Maryland, School of Social Work & Community Planning) **Labeling by self and others: The comparison of behavior among "anti-social" and "pro-social" children in an open community agency.** *Criminal Justice & Behavior*, 1975(Sep), Vol 2(3), 258-275.—150 8-16 yr old males, referred by various professionals and defined as being antisocial, and 221 males defined as prosocial, were observed for 2 hrs/wk at a community center. Behavioral ratings were secured for 30 wks. Ss were pre- and posttested on self-inventories to measure antisocial behavior. In addition, significant adults, such as group counselors, filled out pre- and posttest inventories to measure antisocial behavior. The behavioral data reveals that the 2 categories of Ss did not significantly differ in incidence of prosocial and antisocial behavior. However, data provided by self-inventories are not consistent with the behavioral data. Results are discussed in terms of relevance for labeling theory. (2 p ref)—*Journal abstract.*

4861. Dow, M. G.; Ledwith, F.; Fraser, W. I. & Bhagat, M. (Gartnavel Royal Hosp, Glasgow, England) **The usefulness of the semantic differential with "mild grade" mental defectives.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 386-392.—Tested the hypotheses that (a) mildly retarded Ss, in comparison with Ss of average intelligence, would show less discrimination in the use of the semantic differential (SD) and (b) such discrimination deficiencies would predispose retarded Ss toward a polarized response bias. 20 retarded males (mean age, 19.1 yrs) in a training center and 15 high school students matched for socioeconomic status and age were administered an SD containing 17 concepts representing 3 areas (personal, love-affection, and environmental). Ss rated the concepts on 7 bipolar scales loading on the evaluative dimension, 4 scales on the potency dimension, and 4 on the activity dimension. A discrimination index was computed for each concept. Results support both hypotheses. The significantly lower discrimination indexes of the retarded Ss were largely attributable to their significant preference for the 1st choice point. Results have implications for the reliability and validity of the SD used with retarded groups. (28 ref)—*L. Gorse.*

4869. Rourke, Byron P. (U Windsor, Canada) **Brain-behavior relationships in children with learning disabilities. *American Psychologist***, 1975(Sep), Vol 30(9), 911-920.—Reports on studies emphasizing a neuropsychological approach to the investigation of learning disabilities in children. Areas reviewed include the level of performance approach, attentional deficits, EEG abnormalities, comparisons of performance on the 2 sides of the body, differential score approaches, and the investigation of particular learning disabilities. These studies indicate that cerebral impairment is at least one crucial factor limiting the satisfactory adaptation of children with learning disabilities. (37 ref) R. Tomasko.

4870. Schroth, Marvin L. (U Santa Clara) **The use of IQ as a measure of problem solving ability with mongoloid and nonmongoloid retarded children. *Journal of Psychology***, 1975(Sep), Vol 91(1), 49-56.—Attempted to determine the relationship of MA and IQ to retardates' learning a task involving conceptualization. Such tasks are considered by A. R. Jensen (1965, 1968, 1973, 1974), in his theory on mental abilities, to test Level II abilities as opposed to Level I abilities which involve rote learning and primary memory. The opposing hypotheses of E. F. Zigler (1967) and M. W. Weir

(1967) concerning the use of MA or IQ, respectively, as the best measure of learning rate were examined. A dimension-abstracted oddity task was presented to 40 mongoloid and 40 nonmongoloid White 7-20 yr olds (mean MA, 42.63 mo; IQ range, 24-40). Results support Weir's hypotheses, as IQ was found to determine the rate of learning the task. A major finding shows that nonmongoloids learned the task faster than mongoloid Ss. 4874. Throne, John M. (Lakemary Ctr for Exceptional Children, Paola, KS) **Normalization through the normalization principle: Right ends, wrong means. *Mental Retardation***, 1975(Oct), Vol 13(5), 23-25.—Argues that treating the retarded normally will leave them functioning as retarded. Only extraordinary conditions—non-normal—can result in the diminishing of retarded states.

4875. Wilson, Lonny R. (Mississippi Bend Area Education Agency, Davenport, IA) **Learning disability as related to infrequent punishment and limited participation in delay of reinforcement tasks. *Journal of School Psychology***, 1975(Fal), Vol 13(3), 255-264.—By comparing for learning disabled and control children parental frequency ratings of physical punishment and of completing household tasks, this experiment tested the hypothesis that parental indulgence is associated with learning disorders. 18 1st and 2nd graders with learning problems, matched on grade and sex with those in 2 control groups of 18 Ss each, were rated significantly lower on both measures than were either pupils referred for other reasons or nonreferred pupils. The infrequent punishment suggests that some children have learning problems because of a failure to acquire adequate response inhibition tendencies, which are necessary to control inappropriate behaviors resulting from the ineffective classroom positive reinforcement system. Furthermore, the lower responsibility index suggests some of their academic problems result from limited experiences functioning under delayed reinforcement. —*Journal abstract*.

4876. Winters, John J. & Brzoska, Mary A. (E. R. Johnstone Training & Research Ctr, Bordentown, NJ) **Development of lexicon in normal and retarded persons.** *Psychological Reports*, 1975(Oct), Vol 37(2), 391-402.—24 noninstitutionalized retarded children and 73 kindergartners and 4th and 9th graders labeled chromatic pictures of nouns in a study of the development of their lexicons. Lexical store development was related more to cognitive development (MA) than chronological age. This development was also more highly related with J. B. Carroll and M. N. White's (see PA, Vol 51:9059) measure of age of acquisition of words than to word frequencies in the Thorndike-Lorge word count. The retarded Ss relative efficiency decreased as ease of labeling increased; this led to increasing decrement in performance below expected performance for that MA. This regress in lexical lag is discussed in terms of ages at which words are acquired and the earlier deficiencies of retarded children's lexicons. Comparisons of the several corpora are made in terms of their use in matching normal and retarded groups on experimental tasks in verbal learning. (23 ref)—*Journal abstract*.

4877. Wolf, Lucille C. & Whitehead, Paul C. (Children's Psychiatric Research Inst, London, Canada) **The decision to institutionalize retarded children: Comparison of individually matched groups.** *Mental Retardation*, 1975(Oct), Vol 13(5), 3-7.—Reviewed data on 24 institutionalized retarded children who were individually matched on sex, socioeconomic status, IQ, and American Association of Mental Deficiency diagnostic category, with 24 retarded Ss who remained at home. Results indicated that the sex of the child and the amount of disruption perceived by the family as caused by the child are significant factors in determining the course of institutionalization. It was found that marital integration was most seriously affected by males and that these children were more likely to be institutionalized than females. (20 ref)—*Journal abstract*.

Speech & Language Disorders

4882. Hughes, Jennifer. (U London, England) **Acquisition of a non-vocal "language" by aphasic children.** *International Journal of Cognitive Psychology*, 1974-1975, Vol 3(1), 41-55.—Taught 48% 13 yr old aphasics with serious language deficits to communicate via a system of visual symbols originally devised by D. Premack (1969)

for use with chimpanzees. The Ss readily learned to express several language functions in this way (word, sentence, class-concept, question, and negation). The linguistic status of "Premackese" is questioned, and it is suggested that it is better viewed as a communication system. It is suggested that aphasic children may lack some ability which is specifically linguistic. (French summary) (22 ref)—*Journal abstract*.

4883. Huskey, Robert; Knight, Nancy; Olman, Shirley & Irwin, John V. (Special School District, St Louis County, MO) **A longitudinal study of the spontaneous remission of articulatory defects of 1665 school children in grades 1, 2, and 3.** *Acta Symbolica*, 1973(Fal), Vol 4(2), 73-87.—3,147 1st graders with at least 1 articulatory deviation were identified in September, 1967 by the St Louis County Special District. 327 of the children were assigned to therapy. It was possible to follow 1,665 of the remaining 2,820 children through 5 additional test periods until 1970. None of the children in the study group received speech therapy. The study background and reliability analyses are presented, and the spontaneous remission of articulatory deviations as observed in these children are analyzed in terms of the effects of such factors as phoneme in error, error type, position, sex, patterns of correction, and stimulability. (39 ref)—*Journal abstract*.

(Madison Coll) **Discrimination of the voiced-voiceless distinction by severely hearing-impaired children.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 271-279.—Normal-hearing 8-11 yr olds set voiced-voiceless boundaries at voice onset times (VOTs) similar to those reported for normal-hearing adults who have been presented with synthetic speech stimuli. Hearing-impaired Ss did not set the voiced-voiceless boundaries, but with VOTs exceeding 60 msec, they did identify syllables as voiceless more frequently than as voiced. (20 ref)
4893. Berglund, Göran; Ander, Suzanne; Lindström, Bodil & Tibblin, Gösta. (U Göteborg, Sahlgren's Hosp, Sweden) **Personality and reporting of symptoms in normo- and hypertensive 50 year old males.** *Journal of Psychosomatic Research*, 1975(Apr), Vol 19(2), 139-145.—From a screening examination of the 50-yr-old male population in Göteborg, Sweden, a 3% subsample of 80 Ss was randomly selected as a reference group. All Ss without antihypertensive and with systolic blood pressure greater than 175 or diastolic blood pressure greater than 115 mm Hg on 2 separate occasions made up the untreated hypertension group of 35. Ss on antihypertensive treatment at screening were included in the treated hypertension group of 22. The reference group and the hypertension groups were subjected to the same investigations, including a personality inventory (the Cesarek-Marke Personality Schedule) and a questionnaire measuring the tendency to report symptoms. Untreated, newly discovered hypertensives had a greater need for autonomy than the treated hypertensives, who in turn had a greater need to be taken care of. Untreated hypertensives, especially those with organ damage, tended to report fewer symptoms than the treated hypertensives.—W. G. Shipman.
4894. Bottenberg, E. H.; Lurati, M.; Lützenkirchen, J. & Grüniger, W. (U Würzburg, Neurologische Universitätsklinik, W Germany) [Multiple sclerosis and moods.] (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 27-36.—Studied the prevalent moods in 85 patients with multiple sclerosis using a mood-adjective checklist. The 4 moods determined by factor-analysis—depression, cheerfulness, tendency toward aggressiveness and social openness and interest—were sporadically related to the neurologically objectified degree of severity and the duration of the disease. Most distinct was the positive relationship between severity of disease and depressive mood. (25 ref)—English summary.
4895. Brenner, Richard P.; Schwartzman, Robert J. & Richey, E. T. (U Miami, Medical School, FL) **Prognostic significance of low amplitude or relatively isoelectric EEG patterns.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 582-587.—3 patterns of EEG records are presented for 14 comatose patients. All patients died, indicating grave prognostic implications for all 3 patterns. (30 ref)

(U British Columbia, Vancouver, Canada) **Signal detection analyses of social modelling influences on pain expressions.** *Journal of Psychosomatic Research*, 1975(Apr), Vol 19(2), 105-112.—Examined sensitivity to electrical stimulation and willingness to report pain, using signal detection methodology, in 50 male volunteers exposed to a tolerant or intolerant model, and in a control group. Tolerance to shock was substantially influenced by the modeling procedure as assessed with threshold measures.—W. G. Shipman.
4902. Danhauer, Jeffrey L. & Singh, Sadanand. (Ohio U) **A cross language study of speech production of children in audio and audiovisual modalities.** *Acta Symbolica*, 1973(Fal), Vol 4(2), 29-36.—20 logatomes involving 5 vowels and 20 consonants were presented to 36 5-16 yr olds: 18 hard of hearing and 18 deaf. Of the 18 Ss in each deviancy group, 6 were speakers of English (American), 6 were Serbo-Croatian (Yugoslavian), and 6 were French. The logatomes were analyzed for both initial and medial consonants and medial and final vowels. The stimuli and responses were recorded on magnetic tape and transcribed phonetically by 3 judges. The recorded stimuli and responses were also judged on a 9-point rating scale by 10 judges. Results show significant differences between deviancy groups, vowels and consonants, and modalities (audio vs audiovisual). Significant correlations were found for the phonetic transcriptions of vowels and consonants independently.

and the overall rating scale judgments of the logatomes.

4903. Davidson, Terry M. (Elwyn Inst, Philadelphia, PA) **The vocational development and success of visually impaired adolescents.** *New Outlook for the Blind*, 1975(Sep), Vol 69(7), 314-316.—A review of the literature indicates that visually impaired adolescents are not as vocationally immature as has often been suggested. An effort to combat negative attitudes toward individuals who are visually impaired is recommended.

4904. Dershowitz, Netta K. (Bar-Ilan U, Ramat Gan, Israel) **On connotative meaning of emotional terms to the blind: A contribution to the study of the phenomenology of emotion.** *Perceptual & Motor Skills*, 1975(Aug), Vol 41(1), 87-94.—Conducted a study aimed toward ascertaining whether the hypothesis that emotional experience is universal and relatively independent of learning is tenable. 2 groups of Ss, 25 totally and congenitally blind 9-17 yr olds and 35 normal college adults (representing groups with widely different life experiences) rated the emotions "pride," "sadness," and "anger" on 15 scales of the semantic differential. The latter were used as the index of emotional states on the assumption that these verbal ratings may be considered as reflecting the inner phenomenological experiences. In accord with the hypothesis there was a high degree of correspondence between the ratings of the 2 groups, which, it is contended, may be seen as reflecting highly similar emotional experiences. Of 59 *t* tests comparing the mean ratings of the groups, only 3—a chance number—differed significantly, with the differences being of degree only (i.e., both lay on the same side of the mean).—*Journal abstract.*

4905. Deutsch, Lawrence J. & Rasin, Judy B. (Queens Coll, City U New York) **The validity and reliability of fusion inferred thresholds.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 230-232.—Results in sensorineural hypacusis Ss showed that correlations between conventional and fusion inferred thresholds were highly positive and significant at the 0.005 level of confidence. Test-retest comparisons on a 2nd group of similar Ss yielded a reliability coefficient of 0.92.

4906. Dietz, V. & Schenck, E. (U Freiburg, Neurologische Klinik, W Germany) **[Hereditary polyneuropathy with liability to pressure palsies.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 67-78.—Describes a family with sensory neuropathy, a decrease in conduction velocity at nerve entrapment sites, and in elderly members, a liability to pressure palsies. An autosomal-dominant inheritance is suggested, and classification under the hereditary polyneuropathies is discussed.—*English summary.*

4907. Dodrill, Carl B. & Troupin, Allan S. (U Washington, Medical School) **Effects of repeated administrations of a comprehensive neuropsychological battery among chronic epileptics.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 185-190.—Effects of repeated administrations of the Halstead-Reitan neuropsychological test battery were assessed by administration of the battery on 4 occasions at 6-12 mo intervals to 17 epileptics (mean age, 27.41 yrs) with stable neurological dysfunction. Changes in drug regimen complicated interpretation to some degree, but it appears

that (a) the majority of the neuropsychological measures did not demonstrate significant practice effects; and (b) there were statistically and clinically significant practice effects on some of the most sensitive measures (Category Test, Tactual Performance Test—Localization, and Impairment Index). In addition, the question was raised as to whether the WAIS may be more affected by the administration of anticonvulsants than are many of the other neuropsychological procedures. Caution is urged in interpretation when the battery is used on a repeated basis.—*Journal abstract.*

4908. Duvoisin, Roger C. & Marsden, C. David. (Mt Sinai School of Medicine, City U New York) **Note on the scoliosis of Parkinsonism.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1975(Aug), Vol 38(8), 787-793.—A lateral deviation of the spine and a corresponding tendency to lean to one side was found in 19 of 21 consecutive unoperated patients with Parkinsonism encountered in an outpatient clinic. The direction of postural deviation correlated significantly with the laterality of the major signs and symptoms of Parkinsonism. (23 ref)

4909. Elithorn, Alick; Lunzer, Michael & Weinman, John. (Royal Free Hosp, London, England) **Cognitive deficits associated with chronic hepatic encephalopathy and their response to levodopa.** *Journal of Neurology, Neurosurgery & Psychiatry*, 1975(Aug), Vol 38(8), 794-798.—A battery of computer-based psychological tests given to 7 patients with chronic hepatic encephalopathy showed them to be intellectually impaired, particularly on speed-based measures, as compared with general hospital patients and with patients with cirrhosis but without clinical or EEG evidence of encephalopathy. 2 of the 7 patients in the latter group also showed evidence of cognitive impairment on some tests. The effects of levodopa were also evaluated by sequential assessment with these tests. Although there was some improvement in speed of performance on certain tasks and a suggestion of deterioration on other measures, there was little overall change. It is concluded that levodopa had an "arousing" or antidepressant action and that its effect on intellectual functions was secondary to this alerting effect and was consequently dependent on the emotional and attentional status of the patient. 4911. Freeman, Roger D.; Malkin, Susan F. & Hastings, Jane O. (U British Columbia, Vancouver, Canada) **Psychosocial problems of deaf children and their families: A comparative study.** *American Annals of the Deaf*, 1975(Aug), Vol 120(4), 391-405.—Compared results from parent and school questionnaires, psychological testing, home visit observations, a semistructured parent interview, and a review of available medical data in a study with 120 5-15 yr old prelingually deaf children and a matched group of normal hearing children and their families. In comparison with the hearing group, deaf children were socially disadvantaged due to indirect and direct consequences of deafness. Significant differ-

ences were found in early hospitalization, frequency of home moves, certain areas of behavior, activities permitted by parents, amount of play, and parental expectations. Contrary to previous clinical data, divorce and separation were not more common. Delay in medical diagnosis, the effects of associated brain damage, and the influence of educational controversies are other factors which make it difficult to sort out the inevitable primary consequences of childhood deafness from the secondary social, medical, and educational factors. 4914. **Greer, S. & Morris, Tina.** (King's Coll Hosp, Faith Courtauld Unit for Human Studies in Cancer, London, England) **Psychological attributes of women who develop breast cancer: A controlled study.** *Journal of Psychosomatic Research*, 1975(Apr), Vol 19(2), 147-153.—Interviewed 160 women (consecutive cases) on the day before a breast tumor biopsy, and administered the Mill Hill Vocabulary Scale, the Eysenck Personality Inventory (Form A), and the Hostility and Direction of Hostility Questionnaire. 69 had breast cancer and 91 were benign. Extreme suppression of anger and other feelings was significantly associated with cancer. No group differences were found for intelligence, neuroticism, or extraversion. (22 ref)—*W. G. Shipman.*

4915. **Guillery, R. W.; Okoro, A. N. & Witkop, Carl J.** (U Wisconsin, Madison) **Abnormal vision pathways in the brain of a human albino.** *Brain Research*, 1975, Vol 96(2), 373-377.—Studied the dorsal lateral geniculate nucleus of 1 human albino brain. Results show that the retinogeniculate pathways were abnormal and suggest that quite extensive parts of the retinogeniculate projection, some representing central vision and others peripheral vision, were also abnormal. The abnormal shape and orientation of the nucleus and its relatively small size remain unexplained. (21 ref)

4916. **Haferkamp, G.** (U Mainz, Neurologische Klinik und Poliklinik, W Germany) **[Course and prognosis of unilateral carotid artery occlusion.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 171-186.—In 80 patients with unilateral carotid artery occlusions who had neurological symptoms, their course and prognosis without anticoagulant or surgical therapy were analyzed. 17.5% of these patients died within 4 wks, 43% of this group from extracerebral complications. The survival time of those patients surviving the acute stage was also shortened: 1 yr later only 67% of the patients were still alive, 5 yrs later 58%, and after 10 yrs only 42%. Many died from further cerebrovascular strokes. In most of the patients, carotid artery occlusion was only one of the symptoms of a generalized artery disease, i.e., arteriosclerosis. Resulting poor collateral circulation may have been the crucial factor leading to the poor prognosis as to survival and rehabilitation: only 3.8% of the patients returned to work, 19% were able to walk,

and 55% need nursing. It is suggested that these findings indicate the need for a decisive therapy with respect to the risk factors of stroke, and an alertness to transitory ischemic attacks or small strokes. The latter were found in 56% of the patients. The literature and value of different therapeutic measures are discussed. (34 ref) —*English abstract.*

4931. **Norton, James C.** (U Kentucky, Medical School) **Patterns of neuropsychological test performance in Huntington's disease.** *Journal of Nervous & Mental Disease*, 1975(Oct), Vol 161(4), 276-279. —Administered the WAIS, MMPI, and the Wisconsin modification of the Halstead-Reitan neurophysiological test battery to 6 Huntington's disease (HD) patients (mean age, 46.83 yrs) and 6 brain-damaged control patients (mean age, 46.50 yrs) matched for age and education. Data are compared to that obtained from HD patients in a study by T. J. Boll et al (see PA, Vol 54:3418), and some correspondence specific to HD is suggested. MMPI scores were not significantly different between the HD and brain-damaged groups. WAIS subtests showing significantly greater HD deficits were Arithmetic, Object Assembly, and Picture Completions. —*Journal abstract.*

4932. **Okada, Akira.** [An analysis of individual differences in reading abilities of partially-sighted children.] (Japn) *Japanese Journal of Psychology*, 1975(Aug), Vol 46(3), 165-170. —Analyzed the intra- and inter-individual differences in reading abilities of partially sighted children. Ss, 79 normal-sighted children and 20 partial-sighted ones, were administered 20 tests. In order to analyze the intra-individual differences by the ratio of individual scores obtained, *T* scores were converted into *Z* scores after obtaining the *T* score of each of the 20 tests. Partially-sighted Ss were significantly inferior to normal-sighted Ss in 7 tests. By both cluster analysis and Q-technique, the clusters were found to be unstable in terms of the discrimination of the partially-sighted from the normal-sighted. 2 groups, however, were completely

discriminated by the method of multiple correlation coefficient of which the ratio was 0.839.—*English abstract.*

4933. Raskind, Murray A.; Orenstein, Herbert & Christopher, T. Graham. (U Washington, Medical School, Seattle) **Acute psychosis, increased water ingestion, and inappropriate antidiuretic hormone secretion.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 907-910.—Describes 3 postmenopausal women with agitated psychotic depression, increased water ingestion, and electrolyte values consistent with the syndrome of inappropriate antidiuretic hormone (ADH) secretion. It is hypothesized that this clinical triad represents a syndrome reflecting underlying dysfunction of the hypothalamus and limbic system of the brain. The diagnosis of inappropriate ADH in 1 of the patients was directly confirmed by a recently developed serum radioimmunoassay. (29 ref)—*Journal abstract.*

4937. Rothmund, Elisabeth & Dragojević, Snezana. (Max-Planck-Inst Für Psychiatrie, München, W Germany) **[Non-corrected, traumatic carotid-jugular fistula of long standing: Patho-anatomical findings.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 37-47.—Discusses a 58-yr-old patient who, as a result of a neck injury, developed a traumatic aneurysm of the common carotid artery with signs and symptoms of stasis of the neck and facial regions and cerebral complications which caused death. Neuropathological investigation showed that the long-standing hemodynamic peculiarities of the shunt had led to a severe ectasia of the cerebral vasculature and of the contralateral internal carotid artery. This was accompanied by chronically recurrent blood-brain barrier disturbances, edema, and the beginnings of tissue damage. The ectasia of the contralateral carotid had led to a pressure atrophy of the adjacent optic nerve. An additional cerebral complication is described and verified patho-anatomically. 4938. Rönnebeck, Reinhard W. (U Houston) **A naturalistic investigation of community adjustment of facially disfigured burned teenagers.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 424.

4939. Savoldelli, Guido. (U Zürich, Psychiatrischeklinik, Switzerland) **[Extraversion (E), neuroticism (N), and psychoticism (P) in deaf people.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 213-223.—Studied the personality of deaf people using the framework of H. J. Eysenck's concept of personality. Data gathered with the personality inventory AUPI was evaluated for 66 deaf people (43 congenital or early acquired deafness, 25 late deafness, i.e., after full language development). The consistency of the AUPI Scales in the normal population almost corresponded to that in deaf Ss. Those who went deaf "early" showed a statistically significant higher degree of extraversion than the normal population. There was no significant difference in neuroticism (emotional lability). "Early" deaf Ss had the highest value of psychoticism, and those who developed deafness "late" also differed significantly from the normal population. Psychoticism is, according to U. Baumann and A. Dittrich (1975), reactive aggressivity and depression (reactive to frustration). (23 ref)—*English abstract.*

4940. Seifert, A. R. & Lubar, J. F. (VA Hosp, Tampa, FL) **Reduction of epileptic seizures through EEG biofeedback training.** *Biological Psychology*, 1975(Nov), Vol 3(3), 157-184.—Biofeedback training of the sensorimotor rhythm (SMR) was carried out in 3 male and 3 female adolescent epileptics and in 2 female normal controls. The patients represented a cross-section of epilepsies including grand mal, myoclonic, afocal, and psychomotor types. 3 patients were mentally retarded. 12-14 Hz (SMR) activity was detected by a combination of sharp analog filtering and digital processing. Ss were provided with feedback whenever they produced 0.5 sec of 12-14 Hz activity of specified amplitude. Additional feedback was provided for epileptiform activity slow waves or movement. Feedback for SMR production was inhibited by digital logic circuitry when movement, slow waves, or spikes were present. Seizure reduction was obtained in 5 of the 6 epileptics. Several patients showed increased percentage of SMR and varying degrees of normalization in their EEG when feedback was provided. (16 ref)—*Journal abstract.*

4941. Simonton, O. Carl & Simonton, Stephanie S. **Belief systems and management of the emotional aspects of malignancy.** *Journal of Transpersonal Psychology*, 1975, Vol 7(1), 29-47.—Discusses research on the relationship between emotion and stress and cancer malignancy which suggests that the most important factor predisposing to the actual development of the disease is the loss of a serious love object, occurring 6-18 mo before the diagnosis. Findings on the personality of the cancer patient and important factors in the patient's progress (e.g., the belief systems of the patient, the family and significant others, and the physician) are examined. Data from a study which attempted to correlate the patient's treatment response with different personality characteristics and attitudes are presented: findings from 152 consecutive cases suggest that patients with positive attitudes had good responses to treatment and those with negative attitudes had poor responses. A psychotherapy program designed specifically for cancer patients is outlined which involves consideration of the type of practice and type of patients, demonstrations to the

patients of the "secondary gains" of illness and the significance of choice in reaction to stress, and the use of relaxation and visualization techniques. Several current and potential studies in these areas are briefly noted. (5% p ref)—*L. Gorsey.*

4942. **Turek, Ibrahim S.** (Maryland Psychiatric Research Ctr, Baltimore) **Drug induced dyskinesia: Reality or myth?** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 397-399.—Presents evidence which challenges the concept of drug-induced dyskinesia, despite the fact that dyskinesia, whatever its etiology, is observed in persons with high anxiety levels and histories of psychotropic drug use. On the basis of evidence of an etiological link between phenothiazine drugs and dyskinetic manifestations, it is argued that oral dyskinesia is a symptom complex with undetermined etiology which is prematurely labeled as "drug-induced" by casual observers. Suggestions for further research to determine the specific etiology of dyskinesia are presented. (22 ref)—*L. Gorsey.*

4943. **Velasco, Marcos & Velasco, Francisco.** (General Hosp, Neurosurgical Unit, Mexico City, Mexico) **Differential effect of task relevance on early and late components of cortical and subcortical somatic evoked potentials in man.** *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 353-364.—Studied the effect of "task relevance" on early and late components of cortical and subcortical somatic evoked potentials (SEPs) in 10 parkinsonian patients operated on under local anesthesia for treatment of prominent unilateral tremor. SEPs produced by median nerve stimulation were found at contralateral cortical, thalamic, lemniscal, postlemniscal, prelemniscal, and reticular regions. Subcortical early SEP components consisted of 2 monophasic positive potentials distributed within a circumscribed thalamo-lemniscal region where electrical stimulation elicited consistent sensory responses circumscribed to contralateral hand and face. Significant amplitude changes in cortical and subcortical late SEP components were found concomitant to variations in "task relevance." (16 ref)—*Journal summary.*

4944. **von Cramon, Detlev; Brinkmann, Rüdiger & Schöny, Werner.** (Max-Planck-Institut für Psychiatrie, München, W Germany) **[Quantitative clinical assessment of the course of a case of temporal encephalitis.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 210-211.—Presents the neuropsychiatric symptoms and signs of a case of sporadic encephalitis. Psychopathological features were assessed with the Inpatient Multidimensional Psychiatric Scale (IMPS) which was shown to be useful for objectivation and differentiation of the psychopathological syndrome. A disadvantage of the IMPS is the limited applicability in states with disturbed verbal communication and insufficient recording of mnemonic impairment. Of the 4 states of activation defined for patterns of horizontal and vertical electro-oculogram and EMG recordings, State 2 (i.e., electrical activity of the mentalis-EMG, no blinks, no rapid lateral eye movements) and State 4 (i.e., rapid lateral eye movements, electrical activation of the mentalis EMG) were appropriate measures for a quantitative description of the course of the disease. The relative distribution of State 2 and 4 within 1 period of registration indicates that the decrease of State 2 and the

increase of State 4 were highly correlated with the reduction of psychopathological symptoms. Furthermore, transition among states showed the same correlation during the course of the disease. The ratio of the total number of transitions and nontransitions within 1 period of registration was proportional to the alleviation of clinical signs.—*English abstract.*

4945. **Wernick, Sarah.** (Columbia U) **Obesity and weight loss in Weight Watchers: A study of deviance and resocialization.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3573-3574.

4946. **Wheatley, David et al.** (General Practitioner Research Group, Twickenham, England) **Psychiatric aspects of hypertension.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 327-336.—Surveyed 348 persons in 4 groups (one with 87 persons with a new or previously undiagnosed case of hypertension, another with 87 persons with an already diagnosed and treated case, and 2 matched control groups; mean ages were 53.8, 53.8, 53.7, and 58.2 yrs, respectively. Data collected included demographic information, self-rating symptom scale responses, life situation form ratings, and a physician's report. Although the results show that anxiety symptoms were more common in hypertensive patients, this finding was not significant, and further evidence did not support a relationship between anxiety and hypertension. Although differences were also observed in the variance of systolic blood pressure in relation to the use of psychotropic drugs, this finding has only marginal importance, since the number of patients involved was small. (18 ref)—*L. Gorsey.*

4947. **Willer, J. C.; Bathien, N.; Singer, B. & Lavallard, M. C.** (Hôpital St Antoine, Lab d'exploration fonctionnelle du système nerveux, Paris, France) **[A case of reading epilepsy: Effects of attention and reading tests on EEG and "H" reflex.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1975(Oct), Vol 39(4), 421-424.—Studied the effects of attention and reading tests on the EEG and the H reflex in a patient affected by primary reading epilepsy. During the attention tests, EEG was normal while H reflex was facilitated. On the contrary, during reading tests, EEG showed typical epileptic seizures while at the same time, the H reflex was depressed.

TREATMENT AND PREVENTION

4948. **Autry, Joseph H.** (NIMH, Div of Extramural Research Programs, Clinical Research Branch, Rockville, MD) **Workshop on orthomolecular treatment of schizophrenia: A report.** *Schizophrenia Bulletin*, 1975(Spr), No 12, 94-103.—Presents a summary of studies and papers presented at a workshop on the orthomolecular treatment of schizophrenics. Some of the weaknesses of these studies are discussed.

4949. **Butler, Robert N.** (Washington School of Psychiatry, DC) **Psychiatry and the elderly: An overview.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 893-900.—Notes that the elderly have not been provided with treatment, research, and services commensurate with their needs. These needs are reflected in the increasing incidence of psychopathology, suicide, and

poverty with increasing age. The psychiatric profession's therapeutic nihilism toward the elderly may reflect unresolved countertransference issues that result in a form of prejudice called "ageism." It is posited that many of the conditions labeled "senility" are actually manifestations of socioeconomic or medical problems that could be resolved with prompt, appropriate treatment. Several recommendations are made: the creation of a multidisciplinary nongovernmental commission on mental health and illness of the elderly; reexamination by psychiatrists of their attitudes toward the elderly; and proportionate representation of older individuals in psychiatric services, training, and research. 2 brief case histories illustrating concepts of treatment of the elderly are presented. (30 ref)—*Journal abstract*.

4950. Fontana, Alan F. & Dowds, Barbara N. (VA Hosp, Psychology Service, West Haven, CT) **Assessing treatment outcome: I. Adjustment in the community.** *Journal of Nervous & Mental Disease*, 1975(Oct), Vol 161(4), 221-230.—Examined whether (a) a common outcome pattern exists across different dimensions of adjustment, (b) the vantage point of the observer influences adjustment ratings, (c) judgments of overall improvement encompass the major dimensions of adjustment, and (d) judgments of overall improvement represent changes in adjustment levels. Ss were 171 consecutive male psychiatric admissions (mean age, 39 yrs). The R. B. Ellsworth et al PARS-II scale, a self-report adjustment scale, was used as an outcome measure. Data indicate that each major dimension of adjustment has a somewhat different pattern over time. A substantial consensus existed between patients and their significant others concerning patients' adjustment relative to the adjustment of other patients as described by them and their significant others, although not in terms of the actual magnitude of their adjustment. Global improvement ratings were related to 2 dimensions of adjustment primarily (symptomatology and social involvement). Global improvement ratings appear to be highly reflective of the current level of adjustment. (18 ref)—*Journal abstract*.

4951. German, G. Allen. (Sir Charles Gairdner Hosp, Shenton Park, Australia) **Psychiatric treatment: Its methods and objectives.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 99-106.—Argues that psychiatry is a discipline primarily identified by its acceptance of responsibility for the care of individuals with behavioral disorders and is concerned with the development and use of techniques that will best benefit the individual; that the causes of such disorders are neurological, endocrinological, sociological, interpersonal, or metabolic is irrelevant. The medical model of mental illness is criticized, since it lacks any concepts relating to caring for or alleviating discomfort and instead concentrates on the scientific aspects of illness. Although current views of the medical model are often misleading, the sociological model of psychiatric causes and treatments is equally erroneous; psychiatrists have often permitted themselves to be seduced into the role of social commentator and behavioral advisor. These 2 approaches to psychiatric treatment have diffused the psychiatric role and its emphasis on caring. The need for

a clarity of purpose in contemporary psychiatry is emphasized.—*L. Gorsey*.

4952. Hall, Julian C. & Bradley, Anna K. (Washington U, Medical School, St Louis) **Treating long-term mental patients.** *Social Work*, 1975(Sep), Vol 20(5), 383-386.—Presents a strategy for long-term treatment of patients requiring brief but recurring hospitalizations. E. Goffman's world-building theory is used to determine if psychotic patients need brief intervention, recurring crisis intervention, or long-term intervention. The importance of the social work practice of using the patient's capacity to function during remissions as a basis for future expectations is stressed. The chronic patient develops an increasing capacity to cope with his disorder as he matures. Potential hazards of this approach are also noted.—*R. Tomasko*.

4953. Harper, Robert G. & Wiens, Arthur N. (U Oregon, Medical School, Portland) **Electroconvulsive therapy and memory.** *Journal of Nervous & Mental Disease*, 1975(Oct), Vol 161(4), 245-254.—Reviews recent research on the effects of ECS therapy on memory. Despite some inconsistent findings, unilateral nondominant ECS appears to affect verbal memory less than bilateral ECS. Adequate research on multiple monitored ECS is lacking. With few exceptions, the research methodologies for assessing memory have been inadequate. Many studies have confounded learning with retention, and only very recently has long-term memory been adequately studied. Standardized assessment procedures for short- and long-term memory are needed, in addition to more sophisticated assessment of memory processes, the duration of memory loss, and qualitative aspects of memories. (62 ref)—*Journal abstract*.

4954. Isaacs, A. D. (Bethlem Royal Hosp, London, England) **Geriatric psychiatry.** *Psychiatric Quarterly*, 1974, Vol 48(4), 513-519.—Considers alternatives to large, all-purpose mental hospitals in the context of geriatric psychology. A proposal for psychogeriatric assessment units is discussed, based on problems resulting from patient misplacement in geriatric hospitals. Other types of services for elderly psychiatric patients are also considered. Guidelines for implementing a British national policy in this area are presented.—*R. Tomasko*.

4955. Kayton, Lawrence. (Michael Reese Hosp & Medical Ctr, Psychosomatic & Psychiatric Inst, Chicago, IL) **Toward an integrated treatment of schizophrenia.** *Schizophrenia Bulletin*, 1975(Spring), No 12, 60-70.—Describes a treatment model that is based on 4 phases through which the schizophrenic passes, from the illness's symptomatic inception through the recovery period to an eventual social, vocational, and experiential good outcome. These phases (internal disorganization, postpsychotic regression, middle phase of postpsychotic regression, and termination of postpsychotic regression) are based on an author-conducted study (see PA, Vol 51 03582) of 13 young adult schizophrenics for whom "good outcome" was sustained up to 5.5 yrs after hospital discharge and 26 additional schizophrenics (aged 18-38) who exhibited good outcome for 2-4 yrs. It is concluded that while not all schizophrenics pass through each stage, the model does have utility in the

office and hospital treatment of many schizophrenics. (29 ref)—*M. E. Pounsel.*

4956. **Kecmanović, Dušan.** (U Sarajevo, Yugoslavia) **[Psychiatry and lunacy in historical retrospect.]** (Yugo) *Socijalna Psihijatrija*, 1975, Vol 3(1), 55-72.—Argues that the approach to mental illness has remained basically unchanged during the last 150 yrs from the time when it was singled out as a special medical branch until the present. It is noted that individual procedures for assessing the basic experience of insanity have been improved and this gives the impression that the treatment of mental patients has undergone radical changes and become more advanced, humane, and scientific. It is suggested that the treatment of the mentally ill within psychiatry is fundamentally determined by the experience of insanity characteristic of a given epoch. This occurs in 2 ways: (a) society, by its basic experience of insanity, influences psychiatry and directs its attitudes and methods of treatment and (b) psychiatric treatment is justified only in terms of the background of the social treatment of insanity. The need for historical viewpoints in assessing the phenomena of mental illness is emphasized, and ways in which this type of perspective can sharpen critical attitudes and theories are examined. —*English summary.*

4957. **Kron, Reuben E. et al.** (U Pennsylvania, Medical School) **The assessment of behavioral change in infants undergoing narcotic withdrawal: Comparative data from clinical and objective methods.** *Addictive Diseases: An International Journal*, 1975, Vol 2(1-2), 257-275.—Studies comparing objective measures of sucking with data from fine-grained clinical assessments of the neonate have shown significant correlations between painstaking and time-consuming clinical methods which may only be reliably applied by highly trained clinician-investigators, and the data generated by a simple technique (i.e., a sucking instrument) which can be rapidly and precisely administered in the nursery by nurses or technicians. Within a few minutes the sucking instrument can generate data that explain 50% or more of the variance in certain relevant factors of a neurobehavioral assessment scale developed by T. B. Brazelton et al (1972), which requires the participation of 2 trained clinician-investigators for a period of approximately 1 hr for each test and recording session. Some of the limitations to the information directly available from the sucking measures are discussed. Objective measures of sucking behavior are considered a convenient and reliable means for measuring drug effects in the nursery and may be useful in regulating therapy of the newborn. (18 ref) *Journal summary.*

4958. **Lankford, Sidonie E. & Faires, Wesley L.** (Inst of Logopedica, Wichita, KS) **Objective evaluation of monaural vs binaural amplification for congenitally hard-of-hearing children.** *Journal of Auditory Research*, 1973(Jul), Vol 13(3), 263-267.—5-14 yr old binaural hearing aid wearers were evaluated for their ability to perform on speech reception and speech discrimination tasks. Results show that binaural amplification was statistically superior to monaural on speech discrimination tasks. (26 ref)

4959. **Manuck, Stephen B.; Hinrichsen, James J. & Ross, Elizabeth O.** (U Virginia) **Life-stress, locus of**

control, and treatment-seeking. *Psychological Reports*, 1975(Oct), Vol 37(2), 589-590.—In a study of the relationship between life-stress, locus of control, and illness-related treatment-seeking behavior, 129 undergraduates were divided into internals and externals by Rotter's Internal-External Control Scale and into groups of high and low life-stress Ss by the Life Change Inventory (Category A). 98 Ss were available for follow-up after a 6-mo period of risk. It was found that highly stressed Ss were more likely to seek treatment for physical complaints during risk. Low-stressed externals were more likely to seek treatment than low-stressed internals, but there was no significant difference between internals and externals under high-stress conditions. —*Journal abstract.*

4960. **Montgomery, Iain; Perkin, Graham & Wise, Deirdre.** (Gippsland Inst of Advanced Education, Churchill, Australia) **A review of behavioral treatments for insomnia.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 93-100.—Reviews nonpharmacological treatments for insomnia, including hypnosis, relaxation training, systematic desensitization, classical conditioning, biofeedback, electrosleep, and the use of attribution techniques. A number of psychological factors which may operate in the effective use of such treatment techniques are discussed. Particular consideration is given to the anxiety reduction associated with such processes as attention focusing, relaxation of the musculature, and the development of techniques for self-control. The roles of patient education and modification of expectations regarding insomnia are also discussed. (52 ref)—*Journal abstract.*

4961. **Regestein, Quentin R.; Murawski, Benjamin J. & Engle, Ralph P.** (Peter Bent Brigham Hosp, Boston, MA) **A case of prolonged, reversible dementia associated with abuse of electroconvulsive therapy.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 200-203.—Argues that while the relative safety of ECS therapy is sometimes used to justify its extensive use, ECS is abused in some cases, causing prolonged deficits in sensorium. A case of an ECS-induced, prolonged, reversible dementia in a 57-yr-old woman is presented as an example of present abuses and the need for standards. (18 ref)

4962. **Van den Burg, Willem & Van den Hoffdacker, Rutger H.** (University Hosp, Groningen, Netherlands) **Total sleep deprivation on endogenous depression.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1121-1125.—Deprived 10 endogenous depressive 31-65 yr old patients of sleep for 2 whole nights according to the following schedule: sleep-sleep, deprivation-sleep-sleep, and deprivation-sleep. No drugs were administered. Experimental conditions were as neutral as possible. Blind and nonblind ratings were taken. Ss were generally improved after sleep deprivation, but a substantial effect, though temporary with rapid relapse, occurred in only 2 cases. After subsequent sleep, relapse followed as a rule. The net antidepressive sleep of the total procedure was slightly more than nil. (19 ref) —*Journal abstract.*

4963. **Wallen, Vincent & Araneta, Enrique.** (VA Hosp, Psychology Service, Hampton, VA) **Gilles de la Tourette syndrome: A case study.** *Military Medicine*, 1975(Oct),

Vol 140(10), 705-709.—Describes the case of a 38-yr-old male retired veteran who is described as having a service-connected psychiatric disorder, referred to as Gilles de la Tourette Syndrome. The patient underwent approximately 5 yrs of diagnosis, evaluation, and treatment. Despite a variety of treatment regimens involving chemotherapy, physical therapy, and psychotherapy, there were no permanent curative effects on the patient. The etiology of his disorder was unknown. Longitudinal clinical studies are suggested so that the nature of the disorder can be determined. (17 ref)—*Journal summary*.

4964. Wertheimer, J. (Hosp Geriatrique, Prilly, Switzerland) **The organization of a psychogeriatric service.** *Psychiatric Quarterly*, 1974, Vol 48(4), 520-525.—Special staff training and a planned organization are seen as essential in treating psychogeriatric patients. The psychogeriatrician has a broad range of skills, including a knowledge of rehabilitation, neurology, physiotherapy, egotherapy, and social and preventive medicine. The patient's intellectual and instrumental functions must be considered as well as the state of his physical health and behavior. The special problems related to dementia are discussed, and the aims of the day hospital in this area are contrasted with those of the outpatient clinic.—*R. Tomasko*.

Psychotherapy & Psychotherapeutic Counseling

4965. Antonioni, David T. (U Wisconsin) **A field study comparison of counselor empathy, concreteness and client self-exploration in face-to-face and telephone counseling during first and second interviews.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 866.

4974. Caplan, Ruth T. (U New Mexico) **Attitude change of couples involved in a sexual therapy program.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3053-3054.

4975. Carter, John D. (Rosemead Graduate School of Psychology, CA) **Adams' theory of noutheitic counseling.** *Journal of Psychology & Theology*, 1975(Sum), Vol 3(3), 143-155.—Analyzed J. Adams's (1970, 1973) theory of noutheitic counseling with reference to the nature of man, view of pathology, the counseling model, the counseling process, and the counselor and his techniques. Biblically, Adams' theory is found to be inadequate, since it views man almost entirely in behavioral terms and fails to incorporate such biblical concepts as heart, soul, spirit, and flesh. Adams also fails to provide a biblical basis for building his theory around the word *noutheiteo*. Psychologically, Adams offers no empirical support for his theory and seems unaware of the methodological and research problems involved in supporting his claims. Adams's criticism of Rogers and Freud shows a lack of knowledge of primary sources, and his uncritical positive bias toward Mowrer and Skinner reflects an uncritical presuppositionalism. Finally, he has no theory of motivation or theory of personality.—*Journal abstract*.

4976. Craig, William R. (U Missouri, Columbia) **The effects of cognitive similarity between client and therapist upon the quality and outcome of the psychotherapy relationship.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1272.

4977. D'Andrea, Richard J. (California School of Professional Psychology, Los Angeles) **A handbook on the theory of Gestalt therapy.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 871.

4978. Folman, Rina Z. (Boston U, Graduate School) **Therapist-patient perceptual style, interpersonal attraction, initial interview behavior, and premature termination.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1746.

4979. Frager, Stuart M. (U Texas, Austin) **An investigation of motivation as a factor in change with individual adolescent psychiatric inpatients.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 873.

4980. Friedman, Henry J. (Tufts-New England Medical Ctr, Outpatient Psychiatry, Boston) **Psychotherapy of borderline patients: The influence of theory on technique.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1048-1052.—Notes that there is little agreement on the basic nature of borderline personality disorder or the proper techniques for its treatment. It is suggested that treatment based on the idea that the borderline patient achieves therapeutic gains by raging against an accepting therapist for a prolonged period of time is not so effective as treatment based on the recognition of specific ego defects as the core pathology.

4981. Friedman, Lawrence. **The struggle in psychotherapy: Its influence on some theories.** *Psychoanalytic Review*, 1975(Fal), Vol 62(3), 453-462.—Discussions of psychotherapy by Freud, J. D. Frank (1961), J. Haley (1963), and H. Strupp (1972) are examined. It is maintained that they consider the common problem of conflict between patient and therapist, but with a different emphasis. It is suggested that the theories of the latter 3 writers imply the struggle in psychotherapy, but do not satisfactorily establish its nature.—G. S. Speer.

4982. Fuchs, Lester L. (Younger Psychiatric Medical Clinic, Burbank, CA) **Reflections on touching and transference in psychotherapy.** *Clinical Social Work Journal*, 1975(Fal), Vol 3(3), 167-176.—Touching is considered one way of increasing emotional honesty in psychotherapy. However, the need to be aware of its different significance for particular patients at different times during treatment is stressed. Through clinical vignettes, the value of analyzing resistance is highlighted.—S. R. Stein.

4983. Greenberg, Ramon & Pearlman, Chester. (VA Hosp, Boston, MA) **REM sleep and the analytic process: A psychophysiological bridge.** *Psychoanalytic Quarterly*, 1975(Jul), Vol 44(3), 392-403.—Presents a study of one S in psychoanalysis who was studied in a sleep laboratory on 24 nights. Clear, statistically significant, correlations were found between psychological state (defensive strain) and physiological measures of dreaming (REM latency and REM time). It is concluded that the findings, adding to an understanding of the adaptive functions of REM sleep, demonstrate that the use of analytic concepts can deepen an understanding of physiological processes and, conversely, that physiological findings can clarify analytic formulations. 4986. Kantrowitz, Judith L.; Singer, Judith G. & Knapp, Peter H. (Boston Psychoanalytic Inst, MA) **Methodology for a prospective study of suitability for psychoanalysis: The role of psychological tests.** *Psy-*

choanalytic Quarterly, 1975(Jul), Vol 44(3), 371-391.—Describes a method for using psychological tests in the 1st phase of a longitudinal, prospective study of suitability for psychoanalysis. 4 variables were selected for intensive study: reality testing, level and quality of object relations, affect, and motivation for treatment. A detailed description of the manner in which these variables were evaluated is presented. This method was applied to 30 patients seeking psychoanalysis. There was statistically significant agreement between the raters in their assessment of these patients in all 4 variables. (15 ref)—J. Z. Elias.

4987. Kaplan, Bert L. (Adelphi U) **Overvaluing the therapist: The search for a good object.** *Clinical Social Work Journal*, 1975(Fal), Vol 3(3), 177-186.—A patient's inability to tolerate separation because of faulty mental self-representation is said to contribute to his overvaluing the therapist. A case history gives clinical evidence for this theoretical explanation of the problem. Conditions necessary for the formation of a positive self-image are discussed, and some treatment direction is provided.—S. R. Stein.

4988. Knapp, Peter H. et al. (VA Hosp, Boston, MA) **Clinical measurement in psychoanalysis: An approach.** *Psychoanalytic Quarterly*, 1975(Jul), Vol 44(3), 404-430.—Measurement of the complex phenomena of psychoanalysis is approached by defining interrelated elements in the analytic situation and specifying the range of their variation in scales which can be both generalized and made specific for an individual patient. Using this approach in transcripts of psychoanalytic sessions, ratings were given to painful emotion, impairment of defensive maneuvers, and activation of threatening conflictual fantasies. This preliminary study involved rating of tape-recorded sessions by psychoanalytically oriented judges. Quantitative estimates appeared to relate in many ways to qualitative fluctuations in the patient's state. Such an approach may be helpful in developing more effective clinical theory about emotions, defensive processes, and transference fantasies. (24 ref)—J. Z. Elias.

4991. Lachman, Mildred; Stuntz, Elizabeth C. & Jones, Norman. (George Washington U, Graduate School of Arts & Sciences) **Art therapy in the psychotherapy of a mother and her son.** *American Journal of Art Therapy*, 1975(Jul), Vol 14(4), 105-116.—Presents a case illustrating the role of art therapy in bridging the compartmentalized relationships between a 7-yr-old male and a psychiatric social worker, and between his mother and her psychologist. Art therapy was used to improve the diagnostic understanding of the patients, to see how the mother and child related, and to deal directly with some of the cross-therapy issues by actively involving the 2 therapists. The 2 joint art-therapy sessions are described and discussed. Their impact on the

development of constructive transference and countertransference. *Journal of Art Therapy*.

4992. Landgarten, Helma. (Sinaia Medical Ctr Child & Family Section, Los Angeles, CA) Art therapy as primary mode of treatment for an elective mute. *American Journal of Art Therapy*, 1975(Jul), Vol 14(4), 121-125.—Describes the therapy of a 7-yr-old female who refused to talk. Art was used less as material for interpretation than as a means for self-expression and a springboard for verbal communication. The patient was helped to take risks and to give of herself. Art gave her an opportunity to tell something about herself through a medium less direct and frightening than speech. Results suggest that art therapy has potential as a means of primary treatment for elective mutism. R. Tomasko.

4993. Lewis, Melvin. (Yale U, Child Study Ctr) A note on the trial period in psychoanalysis. *Psychoanalytic Review*, 1978(Feb), Vol 62(3), 463-467. Maintains that a trial period of treatment should be used only as Freud originally intended, i.e., as a brief period of analytic process to clarify the diagnosis and reveal any serious contraindications to psychoanalysis. It is essential that the nature of the trial period be clear to both analyst and analysand. 3 factors which affect the analysis itself are discussed.—G. S. Speer.

4994. Lozes, Jewell H. (Catholic U of America) The relationship between information-processing levels and expectations concerning psychotherapy. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1279.

4995. McNiff, Shaun. (Lesley Coll, Graduate School of Education) Anthony: A study in parallel artistic and personal development. *American Journal of Art Therapy*, 1975(Jul), Vol 14(4), 126-131.—Demonstrates how the unfolding of expressive abilities in art therapy can stimulate general personality development. Art therapy helped a 34-yr-old male state mental hospital patient develop a sense of his ability to creatively act upon and change external reality. He also extended his perceptual awareness by drawing pictures of things around him, giving up his voluntary muteness during the therapy sessions.—R. Tomasko.

4996. Mintz, Ira L. Parapraxis and the mother-child relationship. *Psychoanalytic Quarterly*, 1975(Jul), Vol 44(3), 460-461.—Briefly presents the case of a mother seen in therapy, preparatory to the treatment of her 6-yr-old son who suffered from eczema. Her role in maintaining the child's illness is examined.—J. Z. Elias.

5000. Peoples, Vickie Y. & Dell, Don M. (Ohio State U) Black and White student preferences for counselor roles. *Journal of Counseling Psychology*, 1975(Nov), Vol

22(6), 529-534. 28 Black and 28 White students from 2 university programs viewed a brief videotape of a counseling session in 1 of 4 conditions defined by (a) 2 female counselors (1 Black, 1 White); and (b) 2 counselor roles (active, passive). Analysis of Ss' ratings of counselor performances reveal (a) no differences among conditions in perceived attentiveness or friendliness; (b) significant differences between roles in perceptions of counselor behavior (as intended); (c) significantly higher ratings of competence and helpfulness for counselors in the active vs the passive role, regardless of counselor or S role; and (d) a main effect for counselor, which could not be unequivocally attributed either to counselor role performance or to counselor role. (32 ref)—*Journal abstract*.

5001. Perseley, George; Johnson, James H. & Hornsby, L. G. (U Texas, Medical School, Houston) Effects of profession, sex and prognostic expectancies on therapists' comments in a psychotherapeutic analogue. *Psychological Reports*, 1975(Oct), Vol 37(2), 455-459.—20 24-44 yr old psychotherapists were individually given 1 of 2 psychological reports on a patient which either presented the patient as a good or a poor candidate for therapy. Each therapist then viewed a videotape of the patient in a therapeutic session which allowed the therapist to make written comments as if he were the therapist in the session. Therapists' comments were scored in several categories. No significant differences were found on any of the dependent variables for either good vs poor prognostic information or for psychiatrists vs psychologists. Female therapists used significantly more positive comments, more reflections of feeling, and fewer negative comments than did males. Results suggest that therapists' prognostic expectancy may not be as important a variable as previous correlational research has suggested. The finding concerning males vs females supports some previous studies and stresses the possible relative importance of sex differences vs other variables relating to therapists (e.g., expectancy and training).—*Journal abstract*.

5004. Robinson, Leon R. (Eastern Pennsylvania Psychiatric Inst, Philadelphia) Basic concepts in family therapy: A differential comparison with individual treatment. *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1045-1048.—Presents basic differences between the approaches of family therapy and of the individual therapies on 3 dimensions: personality development, symptom formation, and the approach to producing therapeutic change. Views of the 2 types of therapies regarding these factors are explained.

5005. Rogers, Mary B. (Georgia State U) Therapists' verbalization and outcome in monitored play therapy. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 424.

5006. **Rosenblatt, Daniel.** (Albert Einstein Coll of Medicine, Ctr for Social Research in Rehabilitation Medicine, Yeshiva U) **Opening doors: What happens in Gestalt therapy.** New York, NY: Harper & Row, 1975. xiv, 144 p. \$7.95. —Describes the Gestalt therapist and patient in action and examines the ways in which one affects the other. Both individual and group therapy are covered. Sample sessions are presented, and case histories are included of patients who succeeded and patients who failed.
5007. **Sederer, Lloyd.** (Mary Imogene Bassett Hosp. Cooperstown, NY) **Psychotherapy patient transfer: Secondhand Rose.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1057-1061. —Uses the analogy of the marketplace to examine the transferring of patients in university clinics. The outgoing therapist is the seller, the prospective therapist the buyer, and the patient the commodity—the secondhand Rose. It is posited that such techniques, lacking patient participation, are antithetical to the tenets of psychotherapy. Assigning of therapists of patient's choice is recommended. (15 ref)
5008. **Sell, John M.** (U Missouri, Columbia) **The effects of subject self-esteem, test performance feedback, and counselor attractiveness on influence in counseling.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1734.
5009. **Shapiro, David.** (Private practice, Los Angeles, CA) **Dynamic and holistic ideas of neurosis and psychotherapy.** *Psychiatry*, 1975(Aug), Vol 38(3), 218-226. —Discusses weaknesses in the traditional dynamic psychoanalytic conception of neuroses and their psychotherapeutic consequences. An alternate holistic, characterological conception of neurosis is advocated. Issues related to therapeutic practice are examined, including the definition of "therapeutic material," patient cooperation and motivation, and the meaning of resistance. The importance of the therapist being interested in the patient, as distinct from the patient's "dynamics," is stressed.—*R. Tomasko.*
5010. **Stone, Leo.** **Some problems and potentialities of present-day psychoanalysis.** *Psychoanalytic Quarterly*, 1975(Jul), Vol 44(3), 331-370. —Offers a critical review of the current situation of psychoanalysis and its unique problems. Its potentialities for advancing as therapy and science, their interrelationship, and the possible channels for such advance are examined. The social, clinical, and scientific importance of derivative psychotherapies and of rationally flexible boundaries of "indication" are discussed. As differentiated from rational conservatism, the phenomenon of analysts' irrational resistance to potential change in basic tenets of technique or theory is held to be a formidable impediment to the further development of psychoanalysis. (61 ref)—*J. Z. Elias.*
5011. **Strnad, M.** (Národní Výbor Praha, Správa sociálních služeb, Czechoslovakia) **[Relation between theater play and psychodrama.]** (Czec) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 254-256. —Discusses the psychotherapeutic value of staging scenes from real plays, either as substitutes for or as supplements to A. Moreno's psychodrama. Collective training and rehearsals stabilize groups or communities of patients. Reciting a given text helps "warming up" and facilitates verbal and other acting out by timid or inhibited patients.
- Assignment of well known dramatic roles to patients (Othello, Lear, Oedipus, Hedda Gabler, etc) appears to them less as forced indoctrination, attack, or make-believe as in Moreno's method, and, at the same time, enhances their emotional involvement and participation. Withdrawn or depressed patients find it easier to play roles that are taken from world literature and not explicitly created to fit their case. It is emphasized that playing real theater for therapeutic purposes has long been done in mental hospitals; as illustration, a German report from 1900 is recalled. (Russian & English summaries)—*V. Fischmann.*
5012. **Thompson, Claude W.** (Vanderbilt U) **A study of the effects of therapist self-disclosure on the therapist-client relationship.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1764.
5013. **Van Noord, Robert W.** (Michigan State U) **Stimulated recall with videotape and simulation in counseling and psychotherapy: A comparison of effects of two methodologies with undergraduate student clients.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3073-3074.
5014. **Weiner, Myron F.** (U Texas, Southwestern Medical School, Dallas) **"Individual" versus conjoint therapy.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 546-549. —Posits that the pragmatic test of whether a troubled couple should be treated by an approach oriented toward intrapsychic problems or by an approach with an interpersonal focus lies in the couple's perception of their difficulties. If intrapsychic difficulties are ego-syntonic and experienced primarily at an interpersonal level, that is the level at which treatment must be done. To the extent that each of the marital partners has a differing goal for treatment, different levels of treatment, including individual therapy for both, must be available after an adequate trial of dealing with the couple as a unit.—*Journal summary.*
5015. **Weininger, O.** (Ontario Inst for Studies in Education, Brwnedale, Canada) **The disabled and dying children: Does it have to hurt so much?** *Ontario Psychologist*, 1975(Aug), Vol 7(3), 29-35. —The dying or disabled child often fails to get any psychological assistance. Their needs at various ages and stages of illness and the reasons adults have difficulty dealing with the child's feelings are discussed. The need to help the child express anger and frustration is seen as particularly important.
5016. **Weissman, Herbert N.** (U California, Psychological Services Inst, Davis) **The mental health team as a differential decision-maker for child patients: A national survey.** *Psychological Reports*, 1975(Oct), Vol 37(2), 643-650. —The attitudes of a national sample of 774 clinical psychologists, 791 psychiatric social workers, and 581 psychiatrists were sampled in a closed-ended survey research format to determine (a) the relative degree of communality there is among members of the mental health team in the dispositional judgments they render and (b) whether differential criteria are employed for placing a child patient in individual, group, or conjoint family therapy, or terminating from each of these modalities. 600 of the Ss were sampled for the placement questionnaire and 600 for the termination questionnaire; rates were 41.0 and 39.3%, respectively. Members of the

mental health team strongly agree about the differential relevance of specific criteria for each decision-making condition. Variations in interdisciplinary frames of reference of respondents tended not to influence placement in or termination from the treatment modalities in question.—*Journal abstract.*

5017. Wesson, K. Alan. **The Black man's burden: The White clinician.** *The Black Scholar*, 1975(Jul-Aug), Vol 6(10), 13-18.—Discusses the problems White clinicians have understanding the life and culture of their Black patients. A dialogue between a White psychiatrist and a Black patient is presented to illustrate these problems.

5018. Whyte, R. (Royal Infirmary & Duke Street Hosp, Glasgow, Scotland) **Psychiatric new-patient clinic for non-attenders.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 160-162.—Interviewed 32 nonattenders and a matched group of attender controls at a psychiatric new-patient clinic 6 wks after the missed appointments. The nonattenders were more likely to have had frequent changes of occupation or belong to families where this was the case with the family breadwinner, a history of court conviction, and a history of previous psychiatric treatment. They were less likely than controls to have improved since referral to the clinic and less likely to have a diagnosis of manic depressive psychosis, depressed type. Findings are discussed. There appears to be some self-selection, the most treatable patients keeping their appointments.—*Journal abstract.*

5019. Wonderling, Larry. (California School of Professional Psychology, San Francisco) **The cross-cultural use of Rational Emotive Therapy.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1288-1289.

5020. Wright, Wilbert. (Central Michigan U, Counseling Ctr) **Relationships of trust and racial perceptions toward therapist-client conditions during counseling.** *Journal of Negro Education*, 1975(Spr), Vol 44(2), 161-169.—Studied counselee-counselor empathy conditions which influence expectations and perceptions related to race and trust by analyzing the variance in factored items of 10 dimensions of G. T. Barrett-Lennard's Relationship Inventory (BLRT) for 19 high- and low trusters (as measured by the Interpersonal Trust Scale), approximately equally divided among Black and White lower-level college students. Pre- and post scores on the BLRT were used to measure change in counselee opinions of empathetic relationship. Ss were randomly assigned to 2 Black and 2 White male counselors by race and trust level and were counseled 5 times each. Results show that (a) initially students had preconceived notions about counselors of the opposite race; (b) increased favorability in student perception of counselor positive empathetic ability occurred more for opposite-race counselors; and (c) a relationship existed between counselor race, student perceptions, and trust.—*B. M. Anthony.*

Group & Family Therapy

5021. Allen, Thomas W. (Washington U, Seattle) **"For our next act . . .": An unsystematic prescript to marriage and family counseling: A counseling psychologist's view.** *Counseling Psychologist*, 1975, Vol 5(3), 3-15.—Notes that the dominance of psychoanalysis in family

therapy has been greatly reduced recently, citing disappointment in its lack of effectiveness. The emphasis is now on the family rather than on the individual. It is suggested that the nuclear family is not set up to meet contemporary needs, and that alternative groupings should be explored. Conflict resolution is viewed as a significant technique to be developed. (36 ref)—*H. Silverman.*

5022. Baird, Jane P. (Columbia U) **Changes in patterns of interpersonal behavior among family members following brief family therapy.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 404.

5023. Belson, Richard. (West Nassau Mental Health Ctr, Long Island, NY) **The importance of the Second interview in marriage counseling.** *Counseling Psychologist*, 1975, Vol 5(3), 27-31.—Asserts that the 1st interview in marriage counseling is easy; the counselor gets background data, sets up an interview schedule, talks about the cost, makes a favorable impression, and indicates the nature of the treatment plan. The 2nd interview, however, is difficult. Now the counselor must model good communication, teach clients to avoid generalities and to utilize concrete situations, and point out destructive patterns. A gentle approach is considered the key: criticism is to be avoided; clients do not like their weaknesses to be exposed. They fear dependence. It is suggested that the image to be projected by the counselor in the 1st session is "competence"; in the 2nd session there should be a shift to "let's work together."—*H. Silverman.*

5024. Birchler, Gary R. (U California, Medical School, San Diego) **Live supervision and instant feedback in marriage and family therapy.** *Journal of Marriage & Family Counseling*, 1975(Oct), Vol 1(4), 331-342.—Describes several models of supervision and treatment and discusses the advantages and disadvantages of 4 basic supervision and treatment models: traditional, co-therapy, direct observation with delayed feedback, and direct observation with instant feedback. The increased options in adopting the latter model are emphasized, and a verbatim sample of a case illustrating its use is presented.—*Journal abstract.*

5025. Boulette, Teresa R. (Santa Barbara County Mental Health Services, CA) **Group therapy with low income Mexican Americans.** *Social Work*, 1975(Sep), Vol 20(5), 403-404.—Suggests modifications to traditional group therapy to make it more relevant to Mexican-Americans. Topics considered include extended diagnostic interviews, medical examinations, professional continuity, and language-related therapy.

5026. Brocher, Tobias. (Menninger Foundation, Topeka, KS) **Group methods in parent education.** *International Journal of Group Psychotherapy*, 1975(Jul), Vol 25(3), 315-322.—Describes an approach designed to bring parents into a situation where they can relive their childhood experiences to better understand themselves and their children. In these group sessions, the parents are assumed to be reliving their own childhood as well as identifying with their children. Examples are given of how learning occurs through experiencing unconscious motives by reflecting interactions. Emotional learning results from the direct experience of repeating the past in the presence of a peer group, followed by a period of

working through. Parenthood is considered a developmental phase, with the parent's ability to mature being dependent on what they can learn from their children.

—R. Tomasko.

5027. Cabral, Raimundo J.; Best, June & Paton, Arlette. (Charing Cross Hosp, London, England) **Patients' and observers' assessments of process and outcome in group therapy: A follow-up study.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1052-1054.

—Reports on a 6-mo follow-up investigation of process and outcome in group therapy in 2 therapy groups. Results indicate that although there were discrete stages in the therapeutic sequence, acceptance was the most beneficial process variable for both groups.

5028. Cassidy, Margaret J. (U California, Los Angeles) **Communication training for marital pairs.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3054.

5029. Dannefer, Elaine; Brown, Robert & Epstein, Norman. (Rutgers Community Mental Health Ctr, Piscataway, NJ) **Experience in developing a combined activity and verbal group therapy program with latency-age boys.** *International Journal of Group Psychotherapy*, 1975(Jul), Vol 25(3), 331-337.—Describes experiments with several structures to develop a method for treating withdrawn and acting-out boys. The final system adopted involved the use of a star-chart method for monitoring and rewarding the boy's performance in assigned tasks related to their behavior problems. Each session combined activity and verbal segments with a short discussion period during the activities session. The operation and benefits of this method are discussed.—R. Tomasko.

5030. Dick, Barbara M. (Hope Hosp, Lancastrian Clinic, Salford, England) **A ten-year study of out-patient analytic group therapy.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 365-375.—Studied the effects of analytic group therapy on 93 chronic neurotic patients whose previous psychiatric treatments had proved unsuccessful. Assessments by the therapist and patients before and after therapy were made on the basis of the acceptability of 8 aspects of their life. Follow-up lasted 2½ yrs. Of the 93 patients, 87% showed positive change, a small number showed temporary negative change, and one patient became psychotic but later recovered. It is argued that the "contamination" of results due to therapist involvement in assessment is offset against corroborative evidence of change, in that 96% of the patients became independent of psychiatric and social services after years of dependency. There were also marked changes in life situations and relationships. A need for increased facilities for basic and inservice training of group therapists is indicated. (19 ref) *Journal abstract.*

5031. Dinnen, Anthony & Bell, David S. **Psychotherapy in a large open family group.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 93-98.—Describes a technique of psychotherapy using a large open family group. Family and friends are encouraged to attend and new members are added independently of those leaving the group. Various features of the group are comparable to small group analysis. The group may be used for the exploration and

treatment of family psychopathology. Meetings often contain 20 or more members, with several families being represented. Observers are not limited in number and the group also serves a useful teaching and training function as a consequence. It is suggested that a wide range of patients, including those regarded as unsuitable or too difficult for conventional psychotherapeutic management, may be treated by this technique. 3 illustrative cases are described. (22 ref)—*Journal abstract.*

5032. Finol, Gregorio J. (U Pittsburgh) **The influence of three methods of interpersonal process recall upon parental verbal interaction with a mentally retarded child using short term family psychotherapy.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1274.

5033. Firestone, Evelyn & Moschetta, Paul. (Dix Hills Counseling Ctr, NY) **Behavioral contracting in family therapy.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 27-31.—The integration of the behavioral technique of performance contracting into the family therapy modality is discussed. A case example is presented, and a sample contract is included. Particular attention is paid to the use of contracting as a means of circumventing initial phase resistance in families where dysfunctional patterns of relating are firmly established. (Spanish & French summaries)—*Journal abstract.*

5034. Garcia, Vera L. (Catholic U, Rio de Janeiro, Brazil) **Case study: Family art evaluation in a Brazilian guidance clinic.** *American Journal of Art Therapy*, 1975(Jul), Vol 14(4), 132-139.—Illustrates how family art evaluation gives a diagnostic team a better understanding of the client's problem and pinpoints areas on which to focus therapy. Teams made up of a psychologist, a social worker, and a psychiatrist conducted a joint evaluation of a family, based partially on H. Y. Kwiattowska's method. 6 pictures were produced by each family member: one of no assigned subject, a family portrait, an abstract family portrait, an individual picture started from a scribble, a joint picture started from a scribble, and another unassigned subject picture. As a direct result of the conjoint evaluation, the focus of treatment was changed from the "identified" patient, an 11-yr-old male, to the mother, who was advised to go into individual treatment.—R. Tomasko.

5035. Garrigan, James J. & Bambrick, Andrew F. (Lehigh U, Centennial School) **Short term family therapy with emotionally disturbed children.** *Journal of Marriage & Family Counseling*, 1975(Oct), Vol 1(4), 379-385.—Compared 2 levels of family therapy, using the Family Concept Q Sort, the Barrett-Lennard Relationship Inventory, the Walker Problem Behavior Identification Checklist, and the Piers-Harris Children's Self-Concept Scale. Ss were 42 White middle-class intact families who had sons attending classes for emotionally disturbed children. The study found that short-term family therapy, using G. Zuk's "go between process," effected significant improvement in the interpersonal functioning of the family, as perceived by the identified client.—*Journal abstract.*

5036. Gauron, Eugene F. & Rawlings, Edna I. (U Iowa) **A procedure for orienting new members to group psychotherapy.** *Small Group Behavior*, 1975(Aug), Vol 6(3), 293-307.—Presents a method of orienting new members to psychotherapy groups by increasing the

prospects' knowledge of the process of group therapy. A sample of written materials is presented, including ground rules for group interaction, elements of ideal interpersonal relationships, giving and getting feedback, and goal-setting. Prospects observe recent videotaped segments of the group operation. Pretherapy training is said to facilitate entry into the group, speed up the treatment process, and decrease dropping out of the group.—J. Rubin.

5037. Greer, Steven E. & D'Zurilla, Thomas J. (State U New York, Stony Brook) **Behavioral approaches to marital discord and conflict.** *Journal of Marriage & Family Counseling*, 1975(Oct), Vol 1(4), 299-315.—Reviews the empirical research in behavioral approaches to marital therapy. The level of product of current research designs has not advanced significantly beyond the nonfactorial single-group design, and the breadth of treatment populations has been restricted. The power of the behavioral method is found in its theoretical base, observational and treatment-relevant assessment, procedural specificity, and quantification of outcome. The outcomes of treatment, though relatively small in number, have been almost universally positive and encouraging. (50 ref)—*Journal abstract*.

5038. Haizlip, Thomas; McRee, Christine & Corder, Billie F. (Dorothea Dix Hosp, Child Psychiatry Residency Training Program, Raleigh, NC) **Issues in developing psychotherapy groups for preschool children in outpatient clinics.** *American Journal of Psychiatry*, 1975(Oct), Vol 132(10), 1061-1063.—A survey of 10 randomly selected clinics indicated that only 1 offered group psychotherapy for preschoolers. Experiences of the authors in creating and running therapy groups for preschoolers and in integrating parent counseling with this treatment are described.

5039. Hurvitz, Nathan. **The Miller family: Illustrating the symbolic interactionist approach to family therapy.** *Counseling Psychologist*, 1975, Vol 5(3), 57-104.—Notes that the symbolic interactionist method sets a clear goal, focused in time, at the 1st session of therapy. The clients have to agree upon this goal. The method brings to the surface the diverse interpretations which individual family members have about specific interactions and situations. A rational explanation for irrational behavior is sought. "Why" questions are acceptable, and probing is permitted. Family members are entitled to keep their "secrets" and may be seen individually. The counselor has 3 roles: therapist, consultant, and intermediary. (26 ref)—H. Silverman.

5040. Johnson, Thomas F. (Delaware County Juvenile Court, Family Intervention Services, Media, PA) **Family therapy with families having delinquent offspring.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 32-37.—Considers that therapy with families of delinquent children provokes a number of defensive maneuvers to avoid family involvement in solving their problems. Many families view delinquent behavior as others view psychopathology. The problem for the therapist in either case is to help the family past that point to a place where they can begin to deal with one another and work together to resolve their problems. A therapeutic technique is suggested, and different forms of resistance are

discussed. (Spanish and French summaries)—*Journal abstract*.

5041. Kernberg, Otto F. (Columbia U, Coll of Physicians & Surgeons) **A systems approach to priority setting of interventions in groups.** *International Journal of Group Psychotherapy*, 1975, 251-275.—Discusses the boundary functions of the group leader. These functions occur among systems that are not related in shifting order of hierarchy levels. These hierarchies include value systems, professional and technical requirements across time, and the relationships among personality, group, and social structures. The limited diagnostic value of feedback from the group about its leader's interventions is considered, and the group leader's personality is seen as the crucial system common to all the hierarchies of systems operating in the group situation. Examples are given of the group leader's use of personality defenses against stress. (17 ref)—R. Tomasko.

5042. Knox, David. (East Carolina U) **Affection vs. intercourse: Or, all he wants is my body.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 65-66.—Considers sex problems in marriage in which the wife often feels that she is only a sex object to the husband, while the latter feels that she hates sex. A procedure is described and data presented to respond to these concerns. While only 5 of the 10 couples treated achieved their goals, reasons for failure are given, and suggestions are made regarding the use of the procedure in the future. (Spanish & French summaries)

5043. Kressel, Kenneth & Slipp, Samuel. (Rutgers State U) **Perceptions of marriage related to engagement in conjoint therapy.** *Journal of Marriage & Family Counseling*, 1975(Oct), Vol 1(4), 367-377.—Compared pretreatment marital perceptions of 36 continuing couples with those of 13 couples who terminated conjoint family therapy prior to the 3rd session. Few statistically reliable differences between the groups were found, but the overall pattern of results is consistent with clinical theory and empirical findings in related areas. Compared to terminators, continuing husbands had a more positive view of family life and perceived themselves as more closely allied with their wives. Continuing wives were more dissatisfied with matters in the family than either their husbands or terminating wives, but they also had more power vis-à-vis their husbands than did terminating wives. Results are interpreted in relation to a negotiation model of conjoint therapy. —*Journal abstract*

5044. LaCalle, José J. (United States International U) **Group psychotherapy with Mexican-American drug addicts.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1753.

5045. Lantz, James E. **The rational treatment of parental adjustment reaction to adolescence.** *Clinical Social Work Journal*, 1975(Sum), Vol 3(2), 100-108.—Principles and concepts borrowed from A. Ellis's (1958) rational therapy are illustrated as methods of helping parents who have difficulty with their adolescent children. The process of treatment is described through case examples.

5046. Margolin, Frances M. (United States International U) **An approach to resolution of visitation disputes post-divorce: Short-term counseling.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1754

5047. Markowitz, Irving. (Family Service & Child Guidance Ctr, Orange, NJ) **Making meaningful advice to parents acceptable.** *International Journal of Group Psychotherapy*, 1975(Jul), Vol 25(3), 323-329.—Suggests ways for parental guidance group leaders to make information informative. It is stressed that consideration be given to the packaging and timing of advice, disruption of an individual's existing sets, and the balance between deviation-amplifying and deviation-counteracting feedback processes. Manipulative ways for a therapist to give direct advice without seeming to do so are noted. The importance of permitting a patient to take or reject advice freely by clearly labeling it as advice is stressed. Several clinical examples are presented.—R. Tomasko.
5048. Myers, E. D. (St Edward's Hosp, Cheddleton, England) **Age, persistence and improvement in an open out-patient group.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 157-159.—Analyzed the ages of 87 patients attending an open outpatient group in a general hospital psychiatric outpatient department in relation to persistence with treatment. A highly significant correlation ($p < .001$) was obtained between increasing age and continued attendance, and a significantly greater number were found to attend for 6 mo or more in the age range of 37-47 yrs than at other ages. In a subgroup of 35 patients, all of whom had attended more than 4 sessions and had returned a questionnaire, significant correlations were obtained between age and symptomatic improvement ($p < .05$) and between continued attendance and improvement in interpersonal relationships ($p < .05$).—*Journal abstract.*
5049. Nell, Renee. (The Country Place, Litchfield, CT) **The use of dreams in couples' group therapy.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 7-11.—Discusses Jung's subjective approach to dream interpretation in couples' group therapy. Its usefulness in bringing unconscious material quickly to the surface is noted. Dreams show the connection between manifest behavior and the underlying dynamics, they clarify the characteristic behavior of the psychological types, and they aid the therapeutic process and offer a norm for deciding on termination. (Spanish & French summaries)—*Journal abstract.*
5050. Pavlin, Saul & Rabkin, Richard. (SARAH Ctr for Training in Family Therapy, New York, NY) **Family therapy: Some questions and answers.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 16-26.—2 experienced family therapists discuss therapeutic style, involvement, techniques, methods, handling of sexual material, and the use of self and of co-therapists in family sessions. Issues relating to the 1st session, family fights sessions, types of families, family systems, and termination are detailed. (Spanish & French summaries)
5051. Peck, Bruce B. (Whitehaven-Southwest Mental Health Ctr, Memphis, TN) **Therapeutic handling of marital infidelity.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 52-58.—Considers that marital infidelity has 2 primary dimensions—an overt social-cultural facade and a covert, intense, emotional component. A therapy strategy, based on this formulation and on the presumption that both spouses are equally responsible for the marital fracture, is presented. The therapeutic intervention is aimed at pushing the couple's absurd social impasse to collapse, thereby freeing the couple for expanded marital experiences. (Spanish & French summaries)—*Journal abstract.*
5052. Perlman, Lawrence M. & Bender, Sheila S. (Maimonides Community Mental Health Ctr, Brooklyn, NY) **Operant reinforcement with structural family therapy in training anorexia nervosa.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 38-46.—Describes successful treatment of 2 families in which the index patients were anorectic adolescent females. The treatment combined structural family therapy with behavior modification techniques. Phases which appear to be typical of the treatment are described. The value of the operant reinforcement procedure in family therapy is discussed, along with observations regarding the more effective use of co-therapist teams. (Spanish & French summaries)—*Journal abstract.*
5053. Philage, Mary L.; Kuna, Daniel J. & Becerril, Gloria. (Psychiatric Clinic Inc, Buffalo, NY) **A new family approach to therapy for the learning disabled child.** *Journal of Learning Disabilities*, 1975(Oct), Vol 8(8), 490-499.—Recommendations for a treatment mode for 6-13 yr old learning disabled children and their parents were derived from a questionnaire compiled during a 3-yr period. Recognizing that several approaches in use were ineffective, a new program format was developed. The revised procedure was based on the family's contracting for service and focused on the major reinforcers in a child's life space (i.e., parents, teachers, and peers). Remediation and behavior modification techniques were used, the goal being increased independent functioning of the children. Relating skills also were developed, i.e., synchronizing feelings with words. Positive results were observed in both remediation and socialization.—*Journal abstract.*
5054. Roback, Howard B. & Strassberg, Donald S. (Vanderbilt U, Medical Ctr) **Relationship between perceived therapist-offered conditions and therapeutic movement in group psychotherapy.** *Small Group Behavior*, 1975(Aug), Vol 6(3), 345-352.—Studied the relationship between a patient's perception of therapist-offered conditions (e.g., empathy, positive regard) and therapeutic outcome. Scores on the Barrett-Lennard Relationship Inventory (BLRI) defined the patient's perception of therapist-offered conditions. Outcome was measured by behavioral observations by nurses on pre-post change scores on the Hospital Adjustment Scale (HAS) and the Wittenborn Psychiatric Rating Scale, and by Ss' pre-post results on the MMPI, Symptom Disability Checklist, WAIS, and a Self-Concept Adjective Checklist (SCAC). Also it was hypothesized that demographic variables are related to high and low BLRI scores. Ss were 12 hospitalized chronic schizophrenics. 3 analyses of the data were performed. At pretest, high and low scorers on the BLRI differed only on the SCAC. At posttest, differences were found on the HAS subscales and on the WAIS Performance IQ. Yet, when Ss were divided into high- and low-outcome groups no significant differences were found on the BLRI. It is concluded that perceived therapeutic conditions are unrelated to outcome.—J. Rubin.

5055. Seligman, Milton & Desmond, Richard. (U Pittsburgh) **The leaderless group phenomenon: A historical perspective.** *International Journal of Group Psychotherapy*, 1975, 277-290.—Presents clinical observations by proponents and opponents of leaderless groups. Topics discussed include the alternate session, pre- and postmeetings, leaderless sessions, instrumented feedback, self-directed groups, and the use of tapes. Leaderless sessions may increase cohesiveness, stimulate transference, encourage independence, accelerate the therapeutic process, heighten group interaction, loosen inhibitions, encourage peer feedback receptivity, and facilitate the co-therapeutic function in each member. It is noted that group leaders restrict group and individual development in some instances. (35 ref)—R. Tomasko.

5056. Veltkamp, Lane J. (U Kentucky, Medical Ctr) **School phobia.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 47-51.—The etiology of school phobia in the elementary school child is described as separation anxiety on the part of both the parent and the child. School phobia can be acute or chronic, with the differentiation point being approximately 6 mo. 3 treatment steps are essential: a physician must rule out organic problems, the entire family must be seen with the goal of getting the child to school immediately, and contact with school personnel is vital to reassure them and keep the child in school. If acute school phobia is not treated it becomes chronic, leaving a poor prognosis. (spanish & French summaries)—*Journal abstract*.

5057. Waxenberg, Barbara R. (New York U) **Therapist's empathy, regard, and genuineness as factors in staying in or dropping out of short-term, time-limited family therapy.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1288.

5058. Weiss, Robert L. (U Oregon) **Contracts, cognition, and change: A behavioral approach to marriage therapy.** *Counseling Psychologist*, 1975, Vol 5(3), 15-26.—Describes therapy in which couples are treated by emphasizing positives rather than negatives, by shaping and extinction methods, by contingency control, and by contracts and communication training. Techniques for conflict containment and problem solving are taught. Special treatment modules are utilized. Assessment instruments such as the Locke-Wallace Marital Adjustment Scale, Area of Change Scale, Marital Activities Inventory, Marital Status Inventory, Marital Interaction Coding System, and Spouse Observation Check List are part of the treatment plan. (23 ref)—H. Silverman.

Encounter Group & Sensitivity & Human Relations Training

5059. Cleland, John F. (U Saskatchewan, Regina Campus, Canada) **Changes in sensitivity training groups associated with changes in trainer characteristics.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1271-1272.

5060. Coché, Erich & Flick, Anne. (Friends Hosp. Psychological Services & Research, Philadelphia, PA) **Problem-solving training groups for hospitalized psychiatric patients.** *Journal of Psychology*, 1975(Sep), Vol 91(1), 19-29.—Small groups lasting 8 sessions each and

aimed at improving interpersonal problem-solving skills were conducted for a total of 41 hospitalized psychiatric patients. 40 controls received the same pre- and posttests (MMPI and the Means-Ends Problem Solving Procedure) but no training. 23 Ss participated in play-reading groups without problem-solving training (placebo condition). 3 analyses of variance showed that hospitalization alone improved the Ss' functioning on the criterion test of problem-solving but that the problem-solving training groups advanced the improvement significantly. More disturbed Ss made only slightly greater gains than the less disturbed. The hospital stay was significantly shorter for the experimental and the placebo groups than for the control sample. (15 ref)—*Journal abstract*.

5061. Deardorff, Charles M. (Texas Tech U) **Interpersonal values and behaviors associated with positive change in one form of encounter groups.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1742.

A response to Schutz, Smith, and Rowan.** *Journal of Humanistic Psychology*, 1975(Spr), Vol 15(2), 49-54.—Offers a rebuttal to critics (see PA, Vol 55: Issue 3) of the current author's 1973 study on encounter groups.

5070. Luncford, Ronald D. (United States International U) **Self-concept change of Black college females as a result of a weekend Black experience encounter workshop.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1728-1729.

5071. Miles, Matthew B. (Ctr for Policy Research, New York, NY) Rejoinder to Schutz, Smith, and Rowan. *Journal of Humanistic Psychology*, 1975(Spr), Vol 15(2), 55-58.—Offers a rebuttal to critics (see PA, Vol 55:Issue 3) of the study by M. Lieberman et al (1973) on encounter groups.

5072. O'Dell, Stan & Seller, Gary. (Nova U, Ft Lauderdale, FL) The effects of short-term personal growth groups on anxiety and self-perception. *Small Group Behavior*, 1975(Aug), Vol 6(3), 251-271.—Studied the effects of 4 encounter group techniques on a S's level of anxiety and self-evaluation of his thinking, feeling, and body-image. 50 Ss were given a personal data questionnaire, the anxiety scale of the Institute for Personality and Ability Testing, and a semantic differential instrument as pre- and postmeasures. Group types were encounter, Gestalt, self-discovery, and communication enrichment. Multivariate analysis of variance showed no significant differences between groups or between pre- and postmeasures for any 1 group.—J. Rubin.

5073. Parks, Cris; Becker, W. Michael; Chamberlain, Jonathan M. & Crandell, John M. (Brigham Young U) Eliminating self-defeating behaviors and change in locus of control. *Journal of Psychology*, 1975(Sep), Vol 91(1), 115-120.—Investigated changes in locus of control occurring among participants in a workshop designed to eliminate self-defeating behaviors. Rotter's Internal-External (I-E) Control Scale was administered as pre- and posttest to 36 undergraduate experimental and control Ss. Analysis of covariance indicated that the treatment group moved significantly more than the control ($p < .001$) on the I-E Scale and movement was in the anticipated direction, toward greater internal control. The increased internal control was maintained in a follow-up administration of the I-E Scale 4 mo later. It is concluded that the workshop brought relatively stable changes toward greater perceived internal control. (19 ref)—*Journal abstract*.

5078. Valle, Stephen K. & Marinelli, Robert P. (Boston U) Training in human relations skills as a preferred mode of treatment for married couples. *Journal of Marriage & Family Counseling*, 1975(Oct), Vol 1(4), 359-365.—5 couples experiencing marital difficulties participated in a traditional therapy group with emphasis upon cathartic release and problem solving. A

similar group of 5 couples participated in a training group consisting of a systematic didactic and experiential approach emphasizing the ability to discriminate and communicate helpfully. Results of outcome measures assessing gain in interpersonal skills and overall functioning, including the Interpersonal Relationship Rating Scale, indicate significant improvement in the training as compared to the traditional group. (18 ref)—*Journal abstract*.

5079. Watkins, John T.; Noll, Gary A. & Breed, George R. (U Oklahoma, Health Sciences Ctr, Oklahoma City) Changes toward self-actualization. *Small Group Behavior*, 1975(Aug), Vol 6(3), 272-281.—Conducted 2 experiments which measured changes in the response of 43 Ss to the Personal Orientation Inventory (POI) after sensitivity group sessions. Exp I varied the length of the session: 3 groups of Ss had sessions of 4, 12, or 20 hrs. Exp II varied the number of sessions: 1 group had 1 12-hr session, another had 2 6-hr sessions, and the third had 6 2-hr sessions. The POI was administered before the sessions and 1 wk and 1 mo afterward. Results indicate that neither the marathon nor the massed group encounter was superior in producing positive results.—J. Rubin.

Behavior Therapy & Behavior Modification

5080. Armentrout, David P. (U Tennessee) The effects of self-monitoring on a tension induced pain syndrome. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1268.

5081. Ashkenazi, Zafira. (Ministry of Health, Children's Diagnostic & Rehabilitation Ctr, Beer-Sheba, Israel) The treatment of encopresis using a discriminative stimulus and positive reinforcement. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 155-157.—16 encopretic children were successfully treated by using glycerine suppositories to increase the discrimination control of rectal pressure for elimination. Social and material reinforcers were added for appropriate toileting behavior. A 6-mo follow-up showed that the behavior was maintained.

5082. Azrin, N. H. & Wesolowski, M. D. (Anna State Hosp, Behavior Research Lab, IL) Eliminating habitual vomiting in a retarded adult by positive practice and self-correction. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 145-148.—A combination of self-correction and practice in the correct manner of handling the urge to vomit entirely eliminated the nonmedically-caused vomiting, of many years standing, of a profoundly retarded 36-yr-old female inpatient.

5083. Barton, Elizabeth S. (Meanwood Park Hosp, Leeds, England) The problem of generalization in the operant conditionings of social speech in the severely subnormal: Use of reversal to establish generalizability. *British Journal of Psychiatry*, 1975(Oct), Vol 127, 376-385.—Conducted 3 studies with 6 retarded 27-46 yr old (IQ range, 34-42) Ss who were reinforced for talking to each other. Reinforcement (tokens) was delivered in a reversal design (baseline, reinforcement, no reinforcement, reinforcement). Whether social speech would continue to occur without external reinforcement was examined by observing Ss through a 1-way mirror in an

interview room immediately after each training session. On some occasions, untrained Ss were observed with the trained Ss. Reinforcement was found to be effective in increasing the frequency of social speech. Generalization of the increased rates of speech, however, was poor and only significantly above baseline levels with a pair of Ss who were very responsive to social and material reinforcement. It is concluded that although direct reinforcement increases the rate of social speech in Ss with varying interest in speech, generalization is not likely to occur unless speech in itself has become reinforcing.—*Journal abstract.*

5099. Freeman, B. J.; Graham, Vicki & Ritvo, E. R. (U California, Neuropsychiatric Inst, Los Angeles) **Reduction of self-destructive behavior by overcorrection.** *Psychological Reports*, 1975(Oct), Vol 37(2), 446.—The self-destructive behavior of a 6½-yr-old retarded female was eliminated by an overcorrection procedure. Further research is needed on the application of overcorrection to other forms of self-destructive behavior.

5100. Geske, Frederick D. (U Wisconsin) **The effects on follower behavior of inequity in reinforcement for cooperative responding in mentally retarded adult males.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3136.

5101. Graziano, Anthony M. (Ed). (State U New York, Buffalo) **Behavior therapy with children: II.** Chicago IL: Aldine, 1975. ix, 640 p. \$19.95.—Presents a collection of 39 papers on behavior therapy with children, focusing on the areas of social and political issues, mental retardation, psychotic behavior, self-stimulatory behavior, somatic systems, children's fears, aggressive and antisocial behaviors, schools, family systems, and self-control. An overview of the field's development and integrative review articles are also included. (47 p ref)

5102. Guidry, Lawrence S. (VA Hosp, New Orleans, LA) **Use of a covert punishing contingency in compulsive stealing.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 169.—A young married male with a stealing compulsion of 10-yr duration was successfully treated by using behavior modification techniques including a covert aversive contingency and an awareness training procedure. At a 10-mo follow-up the stealing behavior was virtually eliminated.

5103. Hall, Elizabeth. **From pigeons to people: A look at behavior shaping.** Boston, MA: Houghton Mifflin, 1975. 130 p. \$6.95.—Presents an introduction to the history, development, and applications of behavior modification designed for children aged 10 yrs and older.

5104. Hemingway, Peter. (U Saskatchewan, Regina, Canada) **Expectancy effects in a behavior therapy situation.** *Dissertation Abstracts International*, 1973(Aug), Vol 34(2-B), 875.

5105. Hogan, Robert A. (Illinois State U) **Frigidity and implosive therapy.** *Psychology*, 1975(May), Vol 12(2), 39-45.—Presents an approach to the treatment of frigidity based on Freudian psychodynamics and learning theory. 9 dynamic origins of sexual conflict are considered, and the major goal of implosive therapy for frigidity is seen as the extinction of anxiety. Clinical criteria indicating successful treatment are noted, and the shaping of more mature emotional responses is considered as important as the unlearning of neurotic symptoms. Several examples of imagery themes are given. (15 ref)—R. Tomasko.

5106. King, Larry W. & Turner, Russell D. (Camarillo State Hosp, Neuropsychiatric Inst, CA) **Teaching a profoundly retarded adult at home by non-professionals.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 117-121.—3 nonprofessional, trained, and paid undergraduates were used in a behavior modification program for a profoundly retarded 22-yr-old male whose parents, though they had reservations about behavior modification, agreed to it. The 4 target behaviors were dressing, undressing, toileting, and cooperative play. Measures taken on these behaviors showed improvements during the course of the training and on tests conducted during a 1-yr follow-up. Results are discussed in terms of the use and availability of undergraduates in such programs, the analysis of complex skills into component behaviors, and the positive reaction of the parents to the program. (U Colorado) **The effects of training parents in behavior modification procedures for child management on the child's academic behavior, achievement, and attitudes and on the parent's and the child's perception of the parent-child relationship.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1752-1753.

5109. Lang, Peter J.; Troyer, William G.; Twentyman, Craig T. & Gatchel, Robert J. **Differential effects of heart rate modification training on college students, older males, and patients with ischemic heart disease.** *Psychosomatic Medicine*, 1975(Sep-Oct), Vol 37(5), 429-446.—Compared 70 male undergraduates, patients with ischemic heart disease, and healthy age-matched Ss in a 6-session study of feedback-mediated heart rate modification. Patients had the poorest overall feedback performance. Results are consistent with the hypothesis that interdependence between psychological stimuli and cardiovascular events is reduced in heart disease. (19 ref)

5110. Levitt, Eugene A. (U Otago, Medical School, Dunedin, New Zealand) **Procedural issues in the systematic desensitization of air-travel phobia.** *New Zealand Psychologist*, 1975(Apr), Vol 4(1), 2-9.—Describes the case of a 28-yr-old female whose gross anxiety responses to flying were extinguished following a format which is described as a variant of Wolpean systematic desensitization. Pre- and posttherapy MMPI profiles pointed to a significant lessening of longstanding psychopathology. Several new treatment techniques are described, and further study of these techniques is suggested.—*Journal abstract.*

5111. Logan, Daniel L. & Turnage, John R. (Timberlawn Psychiatric Ctr, Dallas, TX) **Ethical considerations in the use of faradic aversion therapy.** *Behavioral Engineering*, 1975(Sum), Vol 3(1), 29-34.—Argues that it is insufficient for a behavior therapist to defend against criticism by enumerating successes and questioning the logic or lack of information of the critic. The behavior therapist should be accountable for the work he does, be self-critical, and heed the admonitions of others. Some

"therapies" can be harmful to patients; some techniques should be used with special caution and in accordance with guidelines. Disadvantages of punishment in general are listed, and restrictions which should be placed on the use of electrical aversion therapy are detailed. (38 ref) —*Journal abstract.*

5112. Marks, I. M.; Hodgson, R. & Rachman, S. Treatment of chronic obsessive-compulsive neurosis by in-vivo exposure: A two-year follow-up and issues in treatment. *British Journal of Psychiatry*, 1975(Oct), Vol 127, 349-364.—Treated 20 patients with chronic obsessive-compulsive rituals in a partially controlled design by in vivo (i.e., real life) exposure to hierarchies of stressful situations and self-imposed response prevention. Treatment included 4-12 wks as inpatients and lasted an average of 23 sessions. All Ss were followed up for at least 2 yrs. Significant improvement in compulsions was found after 3 wks of exposure and continued after follow-up. After 2 yrs, 14 Ss were greatly improved, 1 moderately improved, and 5 unchanged; in the 3rd yr, the moderately improved patient became symptom free after further treatment. Improvement after 3 wks of exposure was a predictor of a good outcome at 6- and 12-mo follow-up. Muscular relaxation had no effect on rituals; similar effects were observed for modeling, although it did help selected patients. Other findings show that (a) patient's commitment to treatment facilitated exposure and (b) the course of rituals was often independent of that of agoraphobia, marital problems, and depression where these had initially coexisted with rituals. It is concluded that real-life exposure with self-imposed response prevention is usually an effective treatment for chronic compulsive rituals with well-motivated patients. 5115. Meyer, Robert G. (U Louisville) A behavioral treatment of sleepwalking associated with test anxiety. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 167-168.—A 24-yr-old male with a 9-yr history of sleepwalking was cured by means of a loud, aversive whistle used by his wife at each sleepwalking occasion. Systematic desensitization using a 7-item hierarchy eliminated the test anxiety. Recovery persisted at a 1-yr follow-up.

5116. Poole, A. Desmond & Bodeker, G. C. (U Western Australia, Perth Medical Ctr, Shenton Park) Using time restriction to modify compulsive rocking. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 153-154.—A 19-yr-old female university student, with a 2-yr history of compulsive rocking before retiring at night, was treated by imposing a time restriction. Though the patient stated that executing the behavior reduced her anxiety, the treatment was effective, and the compulsion was still absent at a 6-mo follow-up.

5117. Reeves, Joann O. (Texas A&M U) Covert sensitization and weight control: An analysis of escape and imagery variables. *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1283-1284.

5118. Reeves, John L. & Mealiea, Wallace L. (Dalhousie U, Psychological Services Ctr, Halifax, Canada) Biofeedback-assisted cue-controlled relaxation for the treatment of flight phobias. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 105-109.—3 male adults exhibiting an extreme fear of flying were successfully treated using EMG biofeedback-assisted cue-controlled relaxation in conjunction with systematic desensitization. The procedure involved (a) training Ss in deep muscle relaxation using frontalis EMG biofeedback and (b) pairing a self-generated cue word ("Relax") with low levels of frontalis EMG. The cue-controlled relaxation resulted in deeper levels of relaxation than nonassisted relaxation and appears to afford a useful treatment modality for a range of disorders. Cognitive vs conditioning explanations are discussed. (2 ref)—*Journal abstract.*

5119. Rehm, Lynn P. & Plakosh, Paul. (U Pittsburgh) Preference for immediate reinforcement in depression. *Journal of Behavior Therapy & Experimental Psychiatry*, 1975(Aug), Vol 6(2), 101-103.—To test predictions derived from the behavioral analysis of depression of P. M. Lewinsohn et al (1968, 1969) 92 undergraduates were given paper and pencil measures of depression (Multiple Affect Adjective Check List, Depression scale), preference for immediate vs delayed reinforcement, and value of social vs nonsocial reinforcements. Results indicate that more depressed Ss scored more in the direction of preferring immediate reinforcement and that this did not seem to be due to response bias. Depression was not related to social vs nonsocial reinforcer preference. Results are discussed in relation to the function of depressive behavior.—*Journal abstract.*

5120. Rekers, George A. (U California, Los Angeles) Stimulus control over sex-typed play in cross-gender identified boys. *Journal of Experimental Child Psychology*, 1975(Aug), Vol 20(1), 136-148.—Investigated discriminative stimulus control over masculine and feminine sex-typed play behaviors in 5 males, aged 5-8 yrs, with childhood cross-gender identification. Reliable observational measures of play were obtained with 2 sets of toys: (a) dress-up toys (girls' vs boys' apparel) and (b) affect toys (maternal-nurturance play vs masculine-aggression play). With an ABA reversal intra-S design, certain stimulus conditions (e.g., presence of father, mother, male, or female stranger) were discriminative for reliable changes in sex-typed play. Sex-typed play was found to vary as a function of the social stimulus and as a function of the type of play response required. All Ss played predominantly feminine while alone in the playroom. While no single environmental stimulus was consistently discriminative for masculine play across Ss, at least 1 stimulus condition was found for each S under which he played predominantly masculine. 5125. Terfloth, Ingrid & Rackensperger, Walter. (Max-Planck Inst für Psychiatrie, München, W Germany) **[Study of efficacy of training emotional behavior in groups.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 237-243.—Describes a program of training emotional behavior in groups and a method to prove its efficacy. The program was designed to improve recognition of emotional cues and adequate expression of emotions. The methods of behavior therapy used were training of adequate behavior by role playing, modeling, and operant conditioning. The study of efficacy was done as a group comparison between these therapy groups and the assertive training groups. Data were collected using self-rating scales, rating scales completed by partners or relatives of the patients, and direct behavior ratings. Preliminary results show an improvement of self-rating data for the experimental and the control group, but there was no specific effect of any 1 therapy program. (17 ref)—*English abstract.*

Drug Therapy

5135. **Baron, Miron et al.** (Albert Einstein Coll of Medicine, Yeshiva U) **Lithium carbonate response in depression: Prediction by unipolar/bipolar illness, average-evoked response, catechol-O-methyl transferase, and family history.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1107-1111.—Assessed the antidepressant efficacy of lithium carbonate in a double-blind trial in 23 hospitalized depressed patients. Unequivocal response was significantly more frequent in bipolar than in unipolar depressed Ss. Lithium carbonate responders had a greater visual average-evoked response amplitude increase in response to increased stimulus intensity, termed "augmenting." No correlation could be demonstrated between lithium carbonate efficacy and either erythrocyte catechol-O-methyl transferase activity, age of symptom onset, number of hospitalizations, or family history of affective disorders. (46 ref)—*Journal abstract.*

5136. **Biggs, John T.; Holland, William H. & Sherman, William R.** (Washington U, Medical School, St Louis) **Steady-state protriptyline levels in an outpatient population.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 960-962.—Measured steady-state protriptyline levels in 12 outpatients undergoing treatment for depression. The steady-state level of protriptyline was surprisingly high compared with levels obtained when other tricyclic antidepressants were prescribed. It is suggested that this finding probably accounts for the effectiveness of protriptyline at low doses and its frequent side effects.—*Journal abstract.*

5137. **Coleman, James H. & Hayes, Peggy E.** **Drug induced extrapyramidal effects: A review.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 591-593.—Discusses the controversies regarding physicians' habits of prescribing antipsychotics. A summary of the etiological basis of their extrapyramidal side effects is presented. (28 ref)

5138. **Corbett, Lionel.** (U Alabama) **Technique of fluphenazine decanoate therapy in acute schizophrenic illnesses.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 573-575.—Studied the use of fluphenazine decanoate (FD) in 70 inpatients. Results indicate FD can be safely used as the phenothiazine of 1st choice in the management of acute schizophrenic illness, either alone or in combination with other neuroleptics if necessary for additional sedation. Usually 2-5 cc intramuscularly are needed to effect remission. Striopallidal symptoms are the major problem, but these are usually manageable. (17 ref)—*Journal summary.*

5139. **Davis, Kenneth L.; Hollister, Leo E. & Berger, Philip A.** (VA Hosp, Clinical Psychiatric Research Ctr, Palo Alto, CA) **Thyrotropin-releasing hormone in schizophrenia.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 951-953.—Oral administration of thyrotropin-releasing hormone caused deterioration in the clinical status of 7 out of 9 schizophrenic men. Case reports are presented. This change was particularly apparent in the 4 patients diagnosed as paranoid schizophrenics. It is concluded that such changes might

be expected from a drug with properties similar to amphetamine.—*Journal abstract.*

5140. **Edelstein, E.** (Hebrew U, Jerusalem, Israel) **Changing time perception with antidepressant drug therapy.** *Psychiatra Clinica*, 1974, Vol 7(6), 375-382.—Conducted a pilot study on the time sense of 10 depressed patients (mean age, 58 yrs) before, during, and after antidepressant therapy with tricyclic compounds. Short time spans were measured by 2 methods, giving the Ss 2 different tasks. Measurements were performed in the morning and evening hours, in order to take into account diurnal variations. Accuracy of time estimation was considerably deviant. All except 1 S overestimated time. With improvement in depressed state, time sense also improved, although errors were still greater in the morning.—*Journal abstract.*

5141. **Elizur, A. & Davidson, S.** (Tel-Aviv U, Medical School, Shalvata Psychiatric Ctr, Israel) **The evaluation of the anti-autistic activity of sulpiride.** *Current Therapeutic Research*, 1975(Oct), Vol 18(4), 578-584.—Evaluated the specificity of sulpiride in combating the target symptoms of apathy and withdrawal in 14 schizophrenic inpatients. Weekly evaluations were made by 2 psychiatrists independently, using 6 scales (including the Global Clinical Impression, Brief Psychiatric Rating Scale, and the Hamilton Rating Scale for Depression). In the 1st wk, a placebo was administered, in the 2nd wk 800 mg sulpiride intramuscularly daily, continued orally for the next 5 wks of the trial. In 5 patients, marked improvement in their autistic state appeared in the 2nd and 3rd wks, and they were discharged from hospital at the end of the 7-wk study. They became less inhibited, apathetic, and withdrawn, their mood improved, and they responded to social and occupational therapy. No ataractic effects were evident. It is suggested that the mood improvement was a result of the general anti-autistic effect of the sulpiride.—*Journal abstract.*

5142. **Evans, L. E. et al.** (Royal Victoria Infirmary, Newcastle upon Tyne, England) **A double-blind trial of intravenous thyrotrophin-releasing hormone in the treatment of reactive depression.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 227-230.—Conducted a double-blind study with 20 patients (in 2 equal groups) suffering from reactive depression in order to examine the apparent potential of intravenous thyrotrophin-releasing hormone (TRH) as an antidepressant. 600 mg of TRH was compared with placebo administered to Ss daily for 4 days. There was no significant difference between the antidepressant effects of TRH and placebo.—*Journal abstract.*

5143. **Fracchia, J. et al.** (Long Island Research Inst, Central Islip, NY) **Combination drug therapy for the psychogeriatric patient: Comparison of dosage levels of the same psychotropic drugs, used singly and in combination.** *Journal of the American Geriatrics Society*, 1975(Nov), Vol 23(11), 508-511.—Comparison data from 902 long-term psychogeriatric hospital patients failed to support the hypothesis that physicians prescribe lower dosages when combination therapy is used. Rather, the tendency was toward higher dosages.

5144. **Gerlach, Jes et al.** (St Hans Hosp, Roskilde, Denmark) **Peroral and parenteral administration of long-acting neuroleptics: A double-blind study of penflu-**

ridol compared to flupenthixol decanoate in the treatment of schizophrenia. *Acta Psychiatrica Scandinavica*, 1975(Aug), Vol 52(2), 132-144.—Conducted a 12-wk study with 56 schizophrenic patients after a 4-wk preliminary period in which half were on maintenance therapy of parenteral flupenthixol decanoate and the rest on oral penfluridol. Ss were then randomly divided into 2 further groups, one continuing the medication unchanged, the other changing to the alternative drug. It was found possible to make a sudden switch from penfluridol to flupenthixol and vice versa without any significant change in S's condition. The same dosage of penfluridol was used per week as was employed for flupenthixol per fortnight. Changes in the intensity of the symptoms (total Brief Psychiatric Rating Scale score) were more pronounced in the preliminary period than on changed medication in the blind period. Both drugs induced approximately the same degree of akathisia, parkinsonism and autonomic side effects. The practical consequences of equipotent therapeutical effect of a peroral and parenteral long-acting neuroleptic are briefly discussed. (19 ref)—*Journal abstract*.

5145. Ginestet, D.; Secret, Ph. & Deniker, P. (Hôpital Ste Anne, Service hospitalo-universitaire de Santé mentale et de Thérapeutique, Paris, France) [Long acting drugs in psychiatric therapy: Lacks and needs.] (Fren) *Encéphale*, 1975(Feb), NS Vol 1(2), 161-164.—Discusses need for a long-acting neuroleptic comparable to haloperidol. Antidepressant compounds should be powerful, should last more than 1 or 2 days, and should be administered by mouth or intra-muscular injection to limit risk of suicide.

5146. Gittleman-Klein, Rachel. (Queens Coll, City U New York) *Pharmacotherapy and management of pathological separation anxiety*. *International Journal of Mental Health*, 1975(Spring-Summer), Vol 4(1-2), 255-271.—Discusses the presence of significant separation anxiety in children which is easy to ascertain in those with severe and dramatic symptoms such as school phobia. Typically, the children experience various degrees of anxiety when separated from their parents or homes. The school represents a special threat to them and some children manifest anxiety akin to that found in adults. The anxiety makes them miserable and makes them feel different from their normal peers. Some children become demoralized and feel depressed. The anxiety has marked daily fluctuations, making them feel worse in the morning and at night. In the morning, they may experience mild to acute symptoms, such as stomach aches. Pathological separation anxiety may also have behavioral consequences, such as nightmares. They may develop anticipatory anxiety and secondary manipulative maneuvers to protect them from painful situations. Long-term fate of such children is not known well. It is suggested that the effect of imipramine is specific to separation anxiety, not to anxiety in general. The observation that anticipatory anxiety is unaffected by imipramine supports the notion that anxiety is not a unitary psychological state.—A. H. Alawi.

5147. Heimann, Hans. (U Tübingen, Psychiatrische-klinik, W Germany) [Methodological problems of clinical trials of psychotropic drugs.] (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 255-268.

—Argues that clinical studies have only succeeded in differentiating between great categories of psychotropic drugs, but failed to prove finer differences of effects within these categories of substances. 2 points of the testing method are discussed: (a) problems which arise when rating pathological behavior and (b) problems of sampling psychiatric patients. It is noted that many of the symptoms that clinicians and psychologists formerly considered as relevant were extremely rare, and it is maintained that even in clinical studies, it would be possible to choose among the variety of descriptive symptoms those which fulfill requirements of the probabilistic test-model of Rasch and to take only those symptoms to characterize the degree of severity of psychic disturbance in trials with psychotropic drugs. The main problems of sampling are discussed, i.e., the loss of information as a consequence of taking the mean in a group of psychiatric patients, and the role of biological rhythms. It is demonstrated, using 2 cases of depressive patients, that an enormous difference of psychophysiological responsiveness can be hidden behind very similar clinical pictures.—*English summary*.

5148. Hollatz, F. & Girke, W. (Freien U, Psychiatrische & Neurologische Klinik, Berlin, W Germany) [Endocrine psychosyndrome with pronounced loss of psychic drive after long-term treatment with ACTH and corticoids.] (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(1), 49-57.—A 55-yr-old female patient was treated with ACTH and corticoids over a 5-yr period for pemphigus vulgaris. 3½ yrs after the beginning of hormone treatment the patient developed an endocrine psychosyndrome with pronounced loss of psychic drive. Recent research data in endocrinology, neuroendocrinology of behavior, and neuropathology are discussed to illustrate the close interrelationship between the endocrine and central nervous systems. The disorder in the psychic drive of the patient is considered a sign of "regulator exhaustion" in the vegetative endocrine centers of the hypothalamus. (40 ref)—*English summary*.

5149. Howard, Mark L.; Hogan, Terrence P. & Wright, Morgan W. (U Manitoba, Canada) *The effects of drugs on psychiatric patients' performance on the Halstead-Reitan neuropsychological test battery*. *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 166-171.—Studied the relationship between the type and amount of psychotropic drug ingestion in 184 psychiatric patients, using the Halstead-Reitan battery of cognitive-sensory-motor tests. The total patients' group included 68 psychotic patients who were being treated with either phenothiazines or "another drug" (mean ages, 29.3 and 44.3 yrs, respectively), and 80 neurotically depressed patients (mean age, 35 yrs) who were taking either no drugs, phenothiazines, minor tranquilizers, tricyclic antidepressants, or sedatives. Little, if any, effect was noted in terms of psychological test performance when individual drug types were combined and considered in terms of dosage. However, upon a more specific analysis of the data, several suggestive trends occurred, demonstrating that individual drugs have variable effects and that some age groupings are more sensitive to drug effects than other groupings. (19 ref)—*Journal abstract*.

5150. Jain, R. C.; Ananth, J. V.; Lehmann, H. E. & Ban, T. A. (Queen Street Mental Health Ctr, Toronto, Canada) **A comparative study with pipothiazine palmitate and fluphenazine enanthate in the treatment of schizophrenic patients.** *Current Therapeutic Research*, 1974(Dec), No 264, 236 p.—Conducted a comparative, double-blind clinical study with pipothiazine palmitate and fluphenazine enanthate in 30 chronic schizophrenic inpatients. Both treatment groups showed statistically significant improvement in the total scores, all 4 factors, and 11 of the 18 items of the Brief Psychiatric Rating Scale. More patients were discontinued prior to termination of the clinical trial for the pipothiazine (4 patients) group than for the fluphenazine (1 patient) group. The most frequently occurring adverse effects were tremor and weight loss in the pipothiazine group and tremor and insomnia in the fluphenazine. It is suggested that pipothiazine palmitate and fluphenazine enanthate are equally effective as psychotropic drugs in the maintenance treatment of chronic schizophrenic patients. Results are in line with previously reported findings that the activity of pipothiazine palmitate lasts approximately twice as long (i.e., 4 wks) as that of fluphenazine enanthate.—*Journal abstract*.

5151. Kirkegaard, Carsten et al. (Frederiksberg Hosp, Copenhagen, Denmark) **Protirelin stimulation test and thyroid function during treatment of depression.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1115-1118.—Estimated thyroid levels in 15 42-81 yr old patients with endogenous depressions. Before ECS serum thyroxine (T_4) and free T_4 index values were elevated ($p < .02$). After recovery from depression, the levels were normal. Serum triiodothyronine (T_3) and free T_3 index were normal both before and after ECT. Serum thyrotropin (TSH) levels were also normal and not substantially altered by ECS. The mean maximal TSH response to protirelin (thyrotropin-releasing hormone) was diminished in the depressed Ss and normal after recovery. In 3 patients, the increase in TSH response to protirelin after recovery did not occur, and they relapsed within 6 mo, while in 7 Ss with increased TSH response to protirelin after recovery only 1 relapse occurred. The disturbances in the free T_4 index, T_4 , and the protirelin test may in some depressed patients resemble hyperthyroidism, but this condition can be excluded by means of serum T_4 and free T_4 index. (28 ref)—*Journal abstract*.

5152. Leonard, D. P. et al. (Monash U, Clinical Unit, Larundel Hosp, Australia) **A double blind trial of lithium carbonate and haloperidol in Huntington's chorea.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 115-118.—6 female patients with a family history of Huntington's chorea (HC) participated in a double-blind crossover trial involving 4 treatments: lithium carbonate, haloperidol, lithium carbonate and haloperidol, and placebo. Each treatment was administered for 3 wks, and at the end of each treatment period, assessments were made of chorea and a number of psychological variables (e.g., abnormal movements, angry outbursts, confusion, irritability, or depression). None of the treatments significantly affected chorea measurements. Levels of irritability, the frequency of angry outbursts and depression did appear to be affected in some patients by the treatment. 3 patients improved

on a combination of lithium carbonate and haloperidol while the remaining 3 did not. Haloperidol alone significantly raised depression ratings above levels for other treatments including placebo. It is suggested that lithium carbonate and haloperidol together should be seriously considered in the treatment of HC when patients are excessively irritable and impulsive.—*Journal abstract*.

5153. Lion, John R.; Azcarate, Carlos L. & Koepke, Hans H. (U Maryland, Medical School, Baltimore) **"Paradoxical rage reactions" during psychotropic medication.** *Diseases of the Nervous System*, 1975(Oct), Vol 36(10), 557-558.—Presents 2 cases (with a 7-yr-old girl and a 25-yr-old male) to illustrate rage reactions. The cases indicate that there are parallels with regard to the phenomenology of pathological intoxication and the "paradoxical rage reaction"; both are best explained not by simple adverse drug reaction but by an interaction of drug, personality, and environment. (22 ref)—*Journal summary*.

5154. Maskin, Michael B. (Fordham U) **Psychological aspects of "short-term" versus "long-term" L-Dopa therapy in parkinsonism.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 418.

5155. McMillin, W. P. (Private practice, Belfast, Northern Ireland) **Oxprenolol in the treatment of anxiety due to environmental stress.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 965-966.—Conducted 2 trial studies to evaluate the use of oxprenolol in the treatment of symptoms resulting from environmental stress. Ss were 10 men and women with an average age of 38.9 yrs (Trial 1) and 11 women with an average age of 33.9 yrs (Trial 2). Results indicate that on a 3 times/day regimen, 80 mg of oxprenolol was superior to 20 mg of oxprenolol and equally as effective as 5 mg of diazepam. The benefit of B-blocking drugs and the need for further studies are discussed.—*Journal abstract*.

5156. Mišurec, J.; Náhunek, K.; Kamenická, V. & Chmelář, M. (U Jan Evangelista Purkyně, Psychiatrická klinika, Brno, Czechoslovakia) **[The effect of azafen on electroencephalogram.]** (Czech) *Československá Psychiatrie*, 1974(Aug), Vol 70(4), 221-226.—Processed by means of frequency and amplitude analysis the EEG activity of 19 patients with endogenous depression who were treated with the new antidepressive drug azafen (made in USSR). Daily doses up to 250 mg decreased mainly theta and slow alpha waves. Doses of 260-600 mg increased alpha waves and theta waves to a lesser degree. Dominant alpha rhythm was shifted toward faster parts of this frequency band regardless of the level of daily dose. Beta activity was not affected. EEG changes during azafen therapy differ from those caused by imipramine and amitriptyline. While lower doses of azafen produced changes found in stimulating drugs, higher dosage should have sedative effects. (Russian & English summaries) (23 ref)—*V. Fischmann*.

5157. Morris, Louis A. & O'Neal, Edgar C. (Food & Drug Administration, Rockville, MD) **Judgments about a drug's effectiveness: The role of expectations and outcomes.** *Drugs in Health Care*, 1975(Sum), Vol 2(3), 179-186.—2 experiments using a total of 112 male undergraduates analyzed how various expectations and feedback about a drug's effects were combined by the

drug taker when judging the effectiveness of an ingested drug. Expectations were manipulated by varying instructions about the drug's effects. Outcomes were varied by the use of bogus behavioral and physiological feedback. Results indicate that only 1 clearcut expected drug effect is required to convince an individual that he has taken an effective drug. Unexpected effects can also convince an individual that the drug is working; however, the unexpected reaction must be attributed to the drug rather than to some other cause. Results are interpreted in terms of their implications regarding instructions patients receive about drugs.—*Journal abstract.*

5158. **Pardue, Larry H.** (US Naval Hosp, Corpus Christie, TX) **Familial unipolar depressive illness: A pedigree study.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 970-972.—Conducted a study of 5 generations of a family in which several members had unipolar depression responsive to tricyclic medication. The proband was a 20-yr-old housewife with a 5-yr history of depression. Of the 92 descendants of the proband's "normal" great-great-grandfather, 72 were tested MMPI and interviewed. Results indicate that genetic factors play an important role in this disorder, and the need for pharmacogenetic studies in psychiatry is emphasized.—*Journal abstract.*

5159. **Peet, Malcolm.** (Royal Dundee Liff Hosp, Scotland) **The potential difference across the rectal mucosa during depressive illness and lithium therapy.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 144-148.—The potential difference across the rectal mucosa (rectal p.d.) is generated by the active transport of sodium across the mucosa, and it is sensitive to the action of aldosterone. The rectal p.d. values of depressive patients on no treatment, tested while depressed ($n = 16$) or after recovery ($n = 7$), were similar to those of control Ss ($n = 11$), indicating that sodium transport across the rectal mucosa and the activity of aldosterone were normal in these Ss. This contrasts with previous reports of abnormalities of sodium transport and of aldosterone levels in manic-depressive patients. Manic-depressives taking lithium carbonate as a prophylactic agent had significantly elevated rectal p.d. values when normothymic ($n = 22$). Ss who had become depressed while taking lithium ($n = 9$), and in whom prophylaxis had therefore failed, had normal rectal p.d. values. Lack of elevation of rectal p.d. in response to lithium administration may be a characteristic of patients who fail to respond to lithium prophylaxis. (23 ref) *Journal abstract.*

5160. **Perera, H. V.** (Private practice, Colombo, Sri Lanka) **Two cases of Gilles de la Tourette's syndrome treated with haloperidol.** *British Journal of Psychiatry*, 1975(Oct), Vol 127, 324-326. Reports the 1st 2 cases of Gilles de la Tourette syndrome occurring in Sri Lanka. Both patients had the characteristics of the syndrome as described by S. J. Fernando (1967): (a) childhood onset (below 16 yrs of age), (b) multiple motor tics, and (c) unprovoked vocal utterances which may progress to coprolalia. Both patients (a 13-yr-old boy and a 15-yr-old girl) responded to haloperidol, withdrawal of medication being followed by relapse and reintroduction by remission. Data support an organic cause of the syndrome.

although psychological precipitation cannot be ruled out. (15 ref)—*Journal abstract.*

5161. **Post, Robert M. & Goodwin, Frederick K.** (NIMH, Adult Psychiatry Branch, Bethesda, MD) **Time-dependent effects of phenothiazines on dopamine turnover in psychiatric patients.** *Science*, 1975(Oct), Vol 190(4213), 488-489.—4 psychiatric patients studied early during treatment with chlorpromazine and thioridazine demonstrated elevated probenecid-induced accumulations of homovanillic acid, a major dopamine metabolite, in cerebrospinal fluid. In 10 patients studied after longer periods of treatment with phenothiazines, homovanillic acid values were not elevated. This suggests that there are time-dependent effects of phenothiazines on dopamine turnover that may be relevant to the time course of antipsychotic efficacy. (48 ref)—*Journal abstract.*

5162. **Riding, Joyce & Munro, Alistair.** (U Liverpool, England) **Pimozide in the treatment of monosymptomatic hypochondriacal psychosis.** *Acta Psychiatrica Scandinavica*, 1975(Jul), Vol 52(1), 23-30.—Presents case histories of 6 patients who were treated with pimozide. 4 of the cases were diagnosed as monosymptomatic hypochondriacal psychoses, a group with a traditionally poor prognosis. 3 of the 4 responded favorably to pimozide, while the 4th showed partial improvement. A 5th case also showed a marked degree of improvement despite a possibility of early cerebral arteriopathy. The 1 case which showed no improvement was suspected all along of having a personality disorder rather than a psychotic illness, and this was subsequently confirmed. It is suggested that pimozide (a) may be an effective treatment for monosymptomatic hypochondriacal psychoses whatever their etiology and (b) may differentiate rapidly between cases of monosymptomatic hypochondriacal psychoses and dysmorphophobias due to neurotically determined factors.—*Journal abstract.*

5163. **Schiele, B. C.** (U Minnesota, Medical School) **Loxapine succinate: A controlled double-blind study in chronic schizophrenia.** *Diseases of the Nervous System*, 1975(Jul), Vol 36(7), 361-364.—Compared loxapine succinate (20-150 mg/day) and chlorpromazine (200-1,500 mg/day) in a 12-wk double-blind study of 50 25-74 yr old hospitalized chronic schizophrenics. Statistical analyses of Brief Psychiatric Rating Scale (BPRS) scores showed significant improvement for several items and factors in both groups of patients. Both drugs significantly decreased severity of illness on a clinical global impression (CGI) scale. On the Nurses' Observation Scale for Inpatient Evaluation (NOSIE), "manifest psychosis" was improved significantly with chlorpromazine and "global severity" with loxapine succinate. There were no significant treatment differences in BPRS, CGI, or NOSIE items or in the reduction of overall psychopathology. The side effects associated with the drugs differed little with respect to incidence, number, severity, and type. The most frequently reported symptoms in both groups were behavioral, extrapyramidal, and sedative. Analyses of vital signs and clinical laboratory data revealed no evidence of serious untoward effects.—*Journal abstract.*

5164. **Steinbook, Richard M. et al.** (U Miami, Medical School, FL) **Metiapine: A double-blind comparison with chlorpromazine in acute schizophrenic patients.** *Journal*

of *Clinical Pharmacology*, 1975(Oct), Vol 15(10), 700-704.

—Randomly assigned 60 newly admitted acute schizophrenic patients to a double-blind trial of metiapine with a maximum dose of 450 mg/day or to a maximum daily dose of 900 mg/day of chlorpromazine. 21 Ss in each group showed improvement. Improvements on the Physician's Posttreatment Global Impression test were significantly more marked in the metiapine group. A significant difference between treatment groups was found in the Brief Psychiatric Rating Scale on the item of blunted affect. Side effects were similar for both groups, except that 6 Ss in the metiapine group displayed tachycardia on the EKG. The pulse elevation was attributed to the drug dose.—*P. Federman*.

5165. **Sturges, Stanley & Brown, Marian.** (Private practice, Kettering, OH) **Polypsychopharmacy.** *Bulletin of the Menninger Clinic*, 1975(May), Vol 39(3), 274-279.

—Argues that routinely combining antiparkinson drugs with antipsychotics and antidepressants is unnecessary and hazardous. Adding them to combinations of anticholinergic drugs is even worse. Until more knowledge is gained about their proper use, antiparkinson drugs should be reserved for treating emergent symptoms and should be rapidly discontinued or decreased in dosage as side effects develop. In the absence of solid evidence supporting combination psychotropic drug therapy, the psychiatrist should recognize that polypsychopharmacy rarely benefits the patient. Instead, by carefully selecting a single psychotropic drug, then raising or lowering dosage for symptom change, the psychiatrist is usually acting in the patient's best interest.—*J. Z. Elias*.

5166. **Tyrer, Peter & Steinberg, Derek.** (U Southampton, England) **Symptomatic treatment of agoraphobia and social phobias: A follow-up study.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 163-168.—Followed up for a mean period of 1 yr 26 outpatients with agoraphobia and social phobias who had been treated with phenelzine or placebo in a double-blind clinical trial. During the follow-up period Ss received further pharmacotherapy or behavior therapy, except that those Ss originally receiving placebo were not allowed therapy with monoamine oxidase inhibitors. There were no significant differences in the ratings between the 2 groups, but those Ss originally receiving placebo had more additional treatment in the follow-up period. Ss continuing to receive phenelzine frequently experienced a return of symptoms if the drug was withdrawn before 6 mo. Results suggest that phenelzine is of comparable efficacy to other symptomatic treatments for agoraphobia and social phobias but that it acts mainly by symptom suppression. Prolonged treatment in patients with personality disorders is not indicated; improvement is less likely and the danger of dependence is greater. (23 ref)—*Journal abstract*.

5167. **Van Putten, Theodore & Sanders, David G.** (Brentwood VA Hosp, Los Angeles, CA) **Lithium in treatment failures.** *Journal of Nervous & Mental Disease*, 1975 (Oct), Vol 161(4), 255-264.—Administered lithium carbonate to 35 patients with chronic and incapacitating mental illness who had not responded to the usual pharmacological and interactional therapies. If a trial of lithium resulted in unexpected improvement, lithium's contribution was

assessed by double-blind substitution of a placebo followed by lithium in an A-B-A-B design in which the patient served as his own control. The Global Assessment Scale by R. L. Spitzer et al was used to measure improvement. 5 patients improved dramatically; in retrospect, 4 of these 5 patients suffered from nonremitting forms of manic-depressive illness, and the 5th patient suffered from a severe obsessive compulsive neurosis. 6 other chronically hospitalized patients improved to the point of unexpected discharge. A trial of lithium therapy is recommended for the "backward" or intractable patient. (27 ref)—*Journal abstract*.

5168. **Vencovsky, Eugen.** (Karlova U, Psychiatrická klinika, Plzeň, Czechoslovakia) **[On the significance of pharmacopsychiatry for psychiatric rehabilitation.]** (Germ) *Socijalna Psihijatrija*, 1975, Vol 3(1), 3-9.

5169. **Vigeland, Karl.** (U Oslo, Psychological Inst, Norway) **[Changes in the personality functioning of psychotics with neuroleptic treatment.]** (Norg) *Nordisk Psykologi*, 1975, Vol 27(4), 238-245.—Studied 9 patients on admission and after 8 wks of treatment with optimal doses of neuroleptics. Ss were administered the Raven Progressive Matrices, the Gelb-Goldstein-Weigl-Scheerer Object Sorting Test, and the Rorschach. Statistically significant score changes were registered on the 2 latter tests. The importance of the tests' structural complexity concerning activation of cognitive disturbances is discussed. It is suggested that disturbances in, respectively, perceptual organization and thought were related to psychopathologies of dissimilar nature and resistance. Comprehensive evaluation of changes in personality functioning from Rorschach responses indicated qualitatively different directions of change which may have been related to the initial pathology.—*Journal abstract*.

5170. **Ward, Nicholas.** (U Washington, Harborview Medical Ctr, Seattle) **Successful lithium treatment of transvestism associated with manic-depression.** *Journal of Nervous & Mental Disease*, 1975(Sep), Vol 161(3), 204-206.—Describes a case of transvestism in a 24-yr-old manic-depressive man. The behavior had been maintained for 2 yrs and disappeared soon after lithium treatment was begun. It has not returned during the 1st year on lithium. Dynamic and behavioral explanations for this unusual therapeutic response are considered.

5171. **Warneke, L.** (Alberta Hosp, Edmonton, Canada) **A case of manic-depressive illness in childhood.** *Canadian Psychiatric Association Journal*, 1975(Apr), Vol 20(3), 195-200.—Discusses a 14-yr-old male who showed the swings from excitement to depression characteristic of manic-depressive psychosis. The boy's psychosis began at age 12. In the episode at age 14, antipsychotic medication reduced the excitement; a depressive phase followed. A tricyclic antidepressant drug was ineffective; electroconvulsive therapy relieved the depression but left him vague and superficial and exhibiting anxiety in the evenings. Lithium carbonate, tried next, evened out his moods and put him more in touch with other people. Neuropsychological testing during the manic phase showed right hemisphere dysfunction. The boy's paternal grandfather, to whom he was very attached, had died 5 mos before the 1st episode of depression; the boy had overheard talk that his mother might die in pregnancy just before the 1st episode. It is concluded that the boy's

illness was a brain dysfunction involving the temporal lobe on the nondominant side and the limbic system. (20 ref) (French summary)

5172. Wittenborn, J. Richard & Kiremitci, Nafi. (Rutgers State U, Interdisciplinary Research Ctr, New Brunswick) **A comparison of antidepressant medications in neurotic and psychotic patients.** *Archives of General Psychiatry*, 1975(Sep), Vol 32(9), 1172-1176. —Compared the responses of 225 newly hospitalized 19-65 yr old depressed women to amitriptyline hydrochloride, imipramine hydrochloride, and thioridazine, with particular reference to the psychotic-neurotic distinction. During the 1st week, more psychotic Ss required sedation and more antidepressant medication than did neurotic Ss. All treatment groups showed improvement in psychometric criteria after the 1st week. There was decreasing improvement through successive weeks, and no statistically significant differences among treatments emerged. Responses of the neurotic group were superior to those of the psychotic group, but there was no psychometric evidence of interaction between diagnostic classification and treatment effect. Results do not support the hypothesis that any 1 of these treatments is preferable for neurotic patients or for psychotic patients.—*Journal abstract.*

Health Care Services

5176. Doherty, Neville J. & Hicks, Barbara C. **The use of cost-effectiveness analysis in geriatric day care.** *Gerontologist*, 1975(Oct), Vol 15(5, Pt 1), 412-417.—Describes the use of cost-effectiveness analysis to compare alternative social programs in terms of their relative outcomes and costs. The approach suggested, constructed as a result of a study of current day care programs, is at a conceptual level but addresses the need for standardization of methods, generalization of findings, and provides a rationale for evaluating the cost of day care as a component of the social cost of supporting the elderly. To apply the approach a researcher should define a set of outcomes or objectives, which are not necessarily of an economic nature, be able to measure these outcomes, and be able to define and measure the costs of health care and life support. (16 ref)—*Journal abstract.*

5177. Fagerhaugh, Shizuko Y. (U California, San Francisco) **Mismatched properties: Problems in the management of mentally-ill tuberculosis patients.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1606.

5178. Finney, Joseph C.; Brandsma, Jeffrey M.; Tondow, Murray & LeMaistre, Gress. (U Kentucky) **A study of transsexuals seeking gender reassignment.** *American Journal of Psychiatry*, 1975(Sep), Vol 132(9), 962-964.—Conducted a computerized MMPI psychodiagnostic assessment of 19 males and 1 female seeking sex-reassignment surgery. The most pervasive finding was hysterical personality trend (13 of 20 cases). 12 Ss exhibited psychotic trends: 6 showed psychotic thinking on test scores, and 6 received computer-preferred diagnoses of paranoid or schizoid personality. However, most Ss were not considered psychotic on interview, and those who had sex-reassignment surgery had good results.—*Journal abstract.*

5179. Fish, Raymond M. **Visual substitution systems: Control and information processing considerations.** *New Outlook for the Blind*, 1975(Sep), Vol 69(7), 300-304. —Uses a discussion of the visual mechanisms in the higher vertebrates to explore the problems in creating visual substitution systems. Tactile and audio display systems and those involving direct stimulation of the brain using electrodes are discussed. (36 ref)

5180. Fox, Jacob H.; Topel, Jordan L. & Huckman, Michael S. (Rush Presbyterian-St Luke's Medical Ctr, Chicago, Ill) **Dementia in the elderly: A search for treatable illnesses.** *Journal of Gerontology*, 1975(Sep), Vol 30(5), 557-564.—40 patients with senile dementia were evaluated prospectively with laboratory and radiologic investigation, including computerized axial transverse tomography. 5 patients were believed to have potentially treatable illnesses causing the dementia. Case histories are presented. After treatment, the dementia in 1 patient with hypothyroidism was completely resolved. One patient with pernicious anemia was markedly improved, and a 2nd patient with hypothyroidism was somewhat improved. One patient with a brain tumor was not treated, and a severely demented patient with possible normal pressure hydrocephalus died shortly after shunting without improvement. The discovery of these unsuspected illnesses and the gratifying response to treatment in some suggests the importance of systematic evaluation in all patients with senile dementia. (41 ref) —*Journal abstract.*

5181. Fyrö, Bengt; Settergren, Göran & Sedvall, Göran. (St Göran's Hosp, Stockholm, Sweden) **Release of homovanillic acid from the brain of children.** *Life Sciences*, 1975(Aug), Vol 17(3), 397-402.—Demonstrated a significant release of homovanillic acid from the brains of children anesthetized by barbiturate, nitrous oxide, and droperidol-fentanyl prior to elective surgery. Results differed ($p < .001$) from those in adults and children anesthetized by other methods. This direct technique is suggested as an alternative for calculating rates of brain dopamine release. (18 ref)

5182. Kobrynski, Borys. (New York State Dept of Mental Hygiene, Albany) **The mentally impaired elderly: Whose responsibility?** *Gerontologist*, 1975(Oct), Vol 15(5, Pt 1), 407-411.—Notes that in the past, many

elderly people who needed care and shelter were labeled "senile" and were confined in state mental institutions, frequently for life. The growing number of the elderly now no longer being served in total care institutions requires that a linkage of services be organized in the community to meet their needs for general health, mental health, and special services. While a single agency cannot provide the whole spectrum of care, it is argued that one agency should hold itself accountable for the full range of services required by the mentally impaired elderly. A mental health agency should take the initiative to become an advocate for the mentally impaired elderly to assure them prompt and easy access to all health and social programs in the community.—*Journal abstract.*

5183. **Lacome, Bunny.** (York Central Hosp, Richmond Hill, Canada) **Bunny's pie: A simplistic model for constructed empathy.** *Ontario Psychologist*, 1975(Aug), Vol 7(3), 36-38.—Presents a simplified model of communication patterns that tend to build or erode a therapeutic physician-patient relationship. The "do's" and "don't's" in such a relationship are discussed.

5184. **Lindsay, John S.** (Townsville General Hosp, Australia) **Puerperal psychosis: A follow-up study of a joint mother and baby treatment programme.** *Australian & New Zealand Journal of Psychiatry*, 1975(Jun), Vol 9(2), 73-76.—Reports a 1973 follow-up study of a cohort of 54 mothers with puerperal psychoses who were admitted between 1965 and 1969 to a joint mother and baby short-term treatment program. The outcomes indicate that this treatment routine was as satisfactory as other programs which treat the mother alone. Those mothers who, for various reasons, did not complete the joint program did not do so well. (15 ref)—*Journal abstract.*

5185. **Lyle, W. M. & Page, C.** (U Waterloo, School of Optometry, Canada) **Possible adverse effects from local anesthetics and the treatment of these reactions.** *American Journal of Optometry & Physiological Optics*, 1975(Nov), Vol 52(11), 736-744.—Notes that adverse drug reactions are potentially serious and are becoming increasingly common. Although optometrists employ a limited spectrum of drugs, they may encounter such reactions among their patients. Also, there is always a risk that a life threatening situation will develop in a patient apart from the use of drugs. An optometrist must be competent to provide first-aid in an emergency. Tables are provided listing reactions to topical anesthetics with the preferred treatments. Optometrists are reminded that many of these treatments are the responsibility of physicians. Optometrists should be prepared to provide artificial respiration and external cardiac massage and should plan how they will obtain assistance if an emergency occurs in their office.—*Journal abstract.*

5189. **Thompson, Robert G. & Gottlieb, Marvin I.** (U Tennessee, Medical Coll) **Educational jeopardy, an interdisciplinary problem: The physician's contribution.** *Acta Symbolica*, 1973(Fal), Vol 4(2), 46-62.—The physician has a significant role in the diagnosis and treatment of conditions which place a child's educational development in jeopardy. A knowledge of high risk situations and a high index of suspicion for educational disabilities should be applied to the medical care of all children. A method is presented for physicians by which the child with impending or overt academic difficulties may be identified. The function of various allied health professionals is reviewed; the need for an interdisciplinary evaluation is explained. The most important contributions of the physician to the management of the educationally handicapped are (a) early detection and screening; (b) treatment of organic handicaps, including use of psychoactive medications; (c) coordination and monitoring of diagnostic and therapeutic programs; and (d) counselling the family of the educationally jeopardized child. (28 ref)—*Journal abstract.*

5190. **Van Londen, J.** (Municipal Health Services, The Hague, Netherlands) **Occupational rehabilitation: Day centers and workshops.** *Psychiatric Quarterly*, 1974, Vol 48(4), 543-548.—Describes the types of psychiatric services available in Holland. The coordination of private mental hospitals with municipal services and with agencies for partial care is described, and a 3-point philosophy for such services is presented. 2 types of day centers are discussed, and their activities and tertiary preventive role are noted. The effects of Holland's laws governing the provision of sheltered employment and occupational rehabilitation are considered.—*R. Tomasko.*

5191. **Weis, Diane P.** (Vanderbilt U, Law School) **Children's cognitive development: Or how children draw "maps."** *Child Welfare*, 1975(Sep-Oct), Vol 54(8), 567-580. Describes stages of children's cognitive development as a guide to planned intervention by their caretakers. A knowledge of the ways children construct "maps" that accommodate new experiences to their level of cognitive development is important in understanding the child's response to the experiences. The model presented describes the child's motivation, attachments to social objects, operational thought, rules and conflicts, and levels of abstraction. 5 principles to guide caretakers are presented, and 7 phase-specific activities are suggested.—*R. Tomasko.*

Community Services & Mental Health Programs

5193. **Budmon, Richard D.** **Legal dimensions of the psychiatric halfway house.** *Community Mental Health Journal*, 1975(Fal), Vol 11(3), 316-324.—Discusses the

solutions developed in Massachusetts to 3 key legal problem areas with regard to the psychiatric halfway house: (a) the assurance of the overall quality of the programs through rigorous implementation of regulatory statutes; (b) the determination of beneficial location and equitable geographical distribution of these facilities as enabled through local zoning ordinances; and (c) the establishment of standards for safe, suitable, and feasible structures to house the community residence as determined by building codes.

5194. **Chinsky, Jack M.** (U Connecticut) **Collaborative interventions in community mental health: A personal perspective.** In S. E. Golann & J. Baker (Eds), *Current and future trends in community psychology*. New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.—Discusses paraprofessional programs and institutional change attempts. Topics covered include nonprofessional therapeutic attributes, community mental health programs, a collaborative intervention design, a pre-school education program, a behavioral assessment of a ward environment, and a multilevel intervention in an elementary school. (4½ p ref)

5195. **Cumming, John.** (U Vancouver, Canada) **Elements of a comprehensive psychiatric service.** *Psychiatric Quarterly*, 1974, Vol 48(4), 475-482.—Discusses several prominent elements of a comprehensive system of community-based care. The prominent position of operations monitoring and evaluation is noted, together with the need to provide custody, support, and control for selected patients. The efforts expended to insure the system's internal integration through ombudsmen and joint care conferences are described. Special emphasis is placed on the provision of services to the chronic psychotic and the elderly.—R. Tomasko.

5196. **de Lerma Salter, Carlota & Salter, Charles A.** (Searcy State Hosp, Mt Vernon, AL) **Effects of an individualized activity program on elderly patients.** *Gerontologist*, 1975(Oct), Vol 15(5, Pt 1), 404-406.—Elderly patients suffering from both psychological disorders and long-term physical illness are often considered to be in an irreversible state of decline. A combined program of reality orientation, activities of daily living, and recreational activities, together with environmental stimulation, was applied on an individual basis to 21 such patients (age range, 60-86). Those with the motivation to participate in the available activities increased significantly from 14% to 76% in just 4 mo. Many patients who had not cared for their daily necessities, or walked or talked in years, came to do so once more, some to the extent that they could leave the hospital.—*Journal abstract*.

5197. **Farley, O. William; Peterson, Kim D. & Spanos, Gerald.** (U Utah, Graduate School of Social Work) **Self-termination from a child guidance center.** *Community Mental Health Journal*, 1975(Fal), Vol 11(3), 325-334.—Completed household interviews with 52 families who had self-terminated from a child guidance center. Findings indicate that the most common reason for self-termination was (a) parents' expectations of therapy were not fulfilled, (b) general dissatisfaction with services, and (c) lack of progress. Since many of the self-terminators rated the center program highly, it is concluded that

many self-terminators did not actually reject psychotherapy. (17 ref)

5198. **Finzen, Asmus.** (U Tubingen, W Germany) **Psychiatry in the general hospital and the day hospital.** *Psychiatric Quarterly*, 1974, Vol 48(4), 489-495.—Considers that presentation of psychiatric treatment in the general and day hospitals is a realistic alternative to the mental hospital. Hospital admissions data are reviewed, and day hospitals are seen as places for clinical and social rehabilitation. Characteristics of day hospitals require them to be selective and dependent on the availability of other elements of a comprehensive mental health service. A carefully planned coordination of hospital units, outpatient services, and community mental health services is necessary to replace the functioning of the traditional mental health hospital.—R. Tomasko.

5199. **Fourcher, Louis A.** **Compliance structures and change within mental health service organizations.** *Sociology of Work & Occupations*, 1975(Aug), Vol 2(3), 246-256.—Compliance is approached as a reciprocal structure consisting of the exercise of power and the orientation of subordinated actors to that power. The failings of 2 mental health administrative strategies for instituting organizational change are traced to their inability to take full account of professional norms.

5200. **Gambrill, Eileen D.** (U California, School of Social Welfare, Berkeley) **Role of behavior modification in community mental health.** *Community Mental Health Journal*, 1975(Fal), Vol 11(3), 307-315.—Reviews the original concept of the community mental health movement; examines ways in which current service delivery systems deviate from this; offers an alternative framework for service delivery (i.e., a behavioral model); and argues that its implementation would move community services closer to this conception. The implications of this model for intervention in the natural environment and for transitional and prosthetic facilities are described, and examples are given of its use. Emphasis is placed on working in the natural environment whenever possible via the use and cultivation of significant others and via provision of training in self-directed behavior change in addition to the blending of case management with careful evaluation of service. (27 ref)—*Journal abstract*.

5201. **Garrison, Vivian E.** (Columbia U) **Social networks, social change and mental health among migrants in a New York City slum.** *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 35.

5202. **Giardini, Patricia S.** (Michigan State U) **A comparative study of two paraprofessional counseling programs for the disadvantaged.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3058-3059.

5203. **Golann, Stuart E. & Baker, Jeffrey** (Eds). (U Massachusetts, Amherst) **Current and future trends in community psychology.** New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.

5204. **Hawks, David.** (Whitechurch Hosp, Cardiff, England) **Community care: An analysis of assumptions.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 276-285.—Reviews data on 6 categories of assumptions generally used in the implementation of a policy of "community care": the nature of mental illness, the

nature of the community, the course and treatment of mental illness, the proper scope of psychiatry, the burden on the community, and the efficacy of social work. (36 ref)

5205. Iscoe, Ira. (U Texas, Austin) **Becoming a community psychologist.** In S. E. Golann & J. Baker (Eds), *Current and future trends in community psychology*. New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.—Discusses community development programs and the politics of survival with conflicting citizens' groups. Also discussed are training in community psychology, the growth and role of community mental health centers, new types of manpower (e.g., the drug counselor), and boundaries between the university and the community.

5206. Kapur, R. L. (Kasturba Medical Coll, Manipal, India) **Mental health care in rural India: A study of existing patterns and their implications for future policy.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 286-293.—Conducted 3 studies to examine the patterns of mental health care in an Indian village. Study 1 examined the conceptual frameworks of the various traditional and modern healers. Study 2 was an attitude study inquiring about the type of healer favored for psychiatric consultation. Study 3 was a population survey in which every person with 1 or more symptoms was asked whether he or she had consulted anyone for relief of distress. Besides the modern doctors there were 3 types of traditional healers: Vaidis, who practiced an empirical system of indigenous medicine; Mantarwadis, who cured through astrology and charms; and Patris, who acted as mediums for spirits and demons. It was found that 59% of the residents with symptoms had consulted someone. The consultation was determined more by the severity of illness than by sociodemographic factors. Modern doctors were more popular, but most people consulted both traditional and modern healers without regards to the latter's contradictory conceptual framework. Literacy and other sociodemographic factors had no influence on the type of consultation. It is concluded that any scheme for introducing modern psychiatry into rural areas should make use of the locally popular healers, both traditional and modern. *Journal abstract*.

5207. Kirk, Stuart A. & Therrien, Mark E. (U Kentucky, Coll of Social Professions) **Community mental health myths and the fate of former hospitalized patients.** *Psychiatry*, 1975(Aug), Vol 38(3), 209-217. Argues that the decentralization of mental health care delivery and emphasis on local community services has brought with it concomitant problems, not the least of which is the disposition of former inpatients. The policy issues raised by the fate of these patients are considered, based on the experience of Hawaii's mental health system. 4 "myths" of community mental health are reviewed: the myths of rehabilitation, reintegration, monetary savings, and continuity of care. The belief that former patients would be better rehabilitated by a community-based system is questioned. (21 ref) R. Tomasko.

5208. Knickerbocker, David A. (U Florida) **Lay volunteer and professional trainee therapeutic functioning and outcomes in a suicide and crisis intervention**

service. *Dissertation Abstracts International*, 1973(Jul), Vol 34(1-B), 416.

5209. McGrath, Morag. (Gwynedd Technical Coll, Community Care, Bangor, England) **For the people by the people: A resident run advice centre.** *British Journal of Social Work*, 1975(Aut), Vol 5(3), 255-281.—Describes a survey of clients of an independent advice center operated by community nonprofessional staff. The outcome of their visit, their attitudes towards the center and their experiences of other agencies are discussed. The strengths and weaknesses of this type of informal service as experienced by clients are examined in relation to the growing emphasis on the value of self-help groups and the importance of enabling working class people to take a more active part in decisions that affect their lives. (29 ref)—*Journal abstract*.

5210. McNabola, Frances M. (Brandeis U, Florence Heller Graduate School for Advanced Studies in Social Welfare) **Organizational analysis of community mental health centers.** *Dissertation Abstracts International*, 1973(Oct), Vol 34(4-B), 1615.

5211. Newbrough, J. Robert. (George Peabody Coll, Ctr for Community Studies) **Community psychology, 1973: With a view backward and forward.** In S. E. Golann & J. Baker (Eds), *Current and future trends in community psychology*. New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.—Reviews the literature and presents a brief history of community psychology, noting that it has involved persons and knowledge from economics, political science, sociology, public health, and demography. A conceptualization is evolved of a transactional-ecological approach to graduate training. (4½ p ref)

5212. Okura, K. Patrick. (NIMH, Rockville, MD) **Mobilizing in response to a major disaster.** In A. B. Tulipan, C. L. Atneave & E. Kingstone (Eds), *Beyond clinic walls*. University, AL: U Alabama, 1974. xii, 241 p. \$8.50.—Reviews the mobilization efforts that followed 1972's tropical storm Agnes, the "greatest natural disaster in American history." Federal, county, and combined organizational crisis-intervention and mental health services to the flood-stricken population are recounted. A year-long program of mental health services, called Project Outreach, is described.

5213. Padilla, Amado M.; Ruiz, René A. & Alvarez, Rodolfo. (U California, Los Angeles) **Community mental health services for the Spanish-speaking surnamed population.** *American Psychologist*, 1975(Sep), Vol 30(9), 892-905.—Discusses reasons why the Spanish-speaking/surnamed population receives mental health care of a different kind, of a lower quality, and in lesser proportions than any other ethnically identifiable population. This underutilization cannot be explained because of the substitution of either folk medicine or faith healing. Race and social class of the therapist seem to affect the patient's response to treatment, and middle-class values are often misapplied to lower-class patients. 3 models for improved services to this population are described: a professional adaptation model, a family adaptation model, and a barrio service center model. (39 ref)

5214. Peterson, Lucy C. & Jones, Robert S. (North Carolina School for the Deaf, Morganton) **Community-based early childhood programs for the deaf in North Carolina.** *American Annals of the Deaf*, 1975(Aug), Vol

210(4), 422-426.—Describes satellite programs for young deaf children in North Carolina. Significant features of the program include (a) early identification, intervention, and treatment of hearing disorders; (b) thorough evaluation and subsequent planning of appropriate programs of learning, remediation, and treatment; (c) learning experiences for young deaf children that are provided normally for their hearing peers; and (d) the opportunity of remaining at home with the family during early development.

5215. Rosenblum, Gershen. **Community psychology and mental health administration: From the frying pan into the fire.** In S. E. Golann & J. Baker (Eds), *Current and future trends in community psychology*. New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.—Discusses the various roles in administration—planner, educator, organizer and grant writer, mental health consultant, communicator, lobbyist, architectural consultant, coordinator, expeditor, conceptualizer, fund raiser, personnel recruiter, budget analyst, inspector, primary prevention facilitator, and evaluator.

5216. Schmidt, Eva-Renate. (Universitätskliniken, Frankfurt, W Germany) **[Laboratories for community consultation and organizational development in the church.]** (Germ) *Gruppendynamik (Forschung und Praxis)*, 1974(Oct), Vol 5(5), 316-320.—Established laboratories for consultation in communities in an attempt to make Protestant parishes and other organizational systems of churches familiar with the concept of community consultation and to train necessary consultants for this purpose. Community consultations occurred in 5 stages with constant feedback between client and consultant; the laboratory concept was established to coincide with these stages.—M. J. Stanford.

5217. Sims, A. C. & Symonds, R. L. (All Saints Hosp, Birmingham, England) **Psychiatric referrals from the police.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 171-178.—Conducted a study of one mode of inception into psychiatric care wherein mentally disturbed persons coming to the attention of the police are referred to a mental welfare officer and assessed by him, usually in a police station. The officer may then refer for a psychiatric decision, and the patient is examined by a doctor in the police station. The frequency of use of this system was studied from the 1962-73. The data show an increase in referral over the years and indicate that such police referral became an increasing proportion of new referrals to the Mental Health Department. A sample of referrals from the police for 12 mo (252 cases) was studied in greater detail, surveying social characteristics of individual patients, the relationships between such police intervention and areas of the city, the nature of situation requiring intervention, and the management and treatment which these patients received. The effectiveness of this method is discussed, and recommendations are made (33 ref)—*Journal abstract*.

5218. Sorensen, James L. & Joffe, Stephen J. (Bowling Green State U) **An outreach program in drug education: Teaching a rational approach to drug use.** *Journal of Drug Education*, 1975, Vol 5(2), 87-96.—Describes a peer oriented drug education program conducted in a community youth project. In a candid atmosphere, youth and leaders shared feelings and knowledge

about drugs, and the participants made decisions about program direction, format, and curriculum. Evaluative data are presented.

5219. Sparer, Gerald. (National Ctr for Health Services Research, Rockville, MD) **OEO drug treatment programs: Are community-based, nonprofessional, drug-free programs effective?** *Public Health Reports*, 1975(Sep-Oct), Vol 90(5), 455-459.—Surveys program characteristics, client characteristics, program management, and staff skills and concludes that only about 50% of community-based programs are effective at present.—S. Blackman.

5220. Steinfeldt-Foss, Otto W. (Norwegian Mental Health Services, Oslo, Norway) **Elements of a comprehensive psychiatric service.** *Psychiatric Quarterly*, 1974, Vol 48(4), 471-474.—Discusses the role of community psychiatry and stresses the link between sociodynamic factors and mental disorders. The extension of mental health services is seen requiring an epidemiological, sociological, and socioeconomic screening of the catchment area. Community services considered include inpatient, outpatient, emergency, diagnostic, rehabilitative, training, research, and evaluation services. The importance of using existing community resources to multiply the effectiveness of mental health professionals through consultation and education is noted.—R. Tomasko.

5221. Trickett, Edison J. (Yale U) **The educating of a community psychologist.** In S. E. Golann & J. Baker (Eds), *Current and future trends in community psychology*. New York, NY: Human Sciences Press, 1975. 235 p. \$9.95.—Discusses the public school, especially the high school, the author's particular locus of concern. In this connection, discussion centers on an ecological perspective and the assessment of environments. Also discussed are person-environment interactions and community psychology and the university. (3 p ref)

5222. Welu, Thomas C. (U Pittsburgh) **Evaluating a special program for suicide attempters.** *Dissertation Abstracts International*, 1973(Sep), Vol 34(3-B), 1171.

5223. Wing, John. (Inst of Psychiatry, London, England) **[The evaluation of community psychiatric services: Some methodological problems.]** (Germ) *Archiv für Psychiatrie und Nervenkrankheiten*, 1975, Vol 220(3), 245-254.—Notes that it is now accepted practice for any new pharmacological treatment to be comprehensively and intensively evaluated before it is introduced into general clinical practice. The thalidomide tragedy has illustrated the dangers of inadequate testing. It is less obvious, however, that psychosocial treatments need to be assessed just as stringently. Strong claims are made for new forms of social treatment and new forms of service. The effects, for example, of turning from a predominantly hospital-based service to one which depends on the coordination of a large number of smaller community agencies, are potentially much greater than anything that could be expected from the introduction of a new drug. It is considered essential for psychiatrists to play their full part in this new and rapidly developing field of investigation. (38 ref)—*English abstract*.

Counseling & Social Casework

5224. **Baird, Emily & Redfering, David L.** (Escambia County Mental Health Ctr, Pensacola, FL) **Behavior modification in marriage counseling.** *Journal of Family Counseling*, 1975(Fal), Vol 3(2), 59-64.—Details a case study in which the spouses were counseled jointly with a cognitive approach and separately with behavior modification techniques for the husband's obesity and the wife's lack of affective verbalization. After 8 wks, the husband had lost 30 lb, and the wife's affective language had increased markedly. The couple's relationship had improved, with future plans of adopting a child and purchasing a house. (Spanish & French summaries) —*Journal abstract.*

5225. **Bartollas, Clemens.** (Sangamon State U) **Sisyphus in a juvenile institution.** *Social Work*, 1975(Sep), Vol 20(5), 364-368.—Discusses the problems produced for social workers in a training school by differing expectations on the parts of administrators, staff, and residents. Factors are noted which characterize effective treatment agents.

5226. **Blair, Ralph.** **Counseling and homosexuality:** Keynote address of the 1975 National Conference Series of the Homosexual Counseling Journal. *Homosexual Counseling Journal*, 1975(Jul), Vol 2(3), 94-106.—Considers that good counseling mitigates the effects of oppression and mismanagement of the homosexual's life and facilitates fuller functioning. Problems related to the use of all-inclusive stereotypical labels such as "homosexual" or "gay" are discussed. Bisexual adjustment is seen as the traditional mode of coping with homosexual desires in American society. Other topics discussed include aging and homosexuality, coming out, parents of homosexual children, homosexual parents, lesbians and feminists, gay social options, religion, occupational choice, and gay couple counseling.—*R. Tomasko.*

5227. **Burkhardt, Jane M.** (George Washington U) **Some methods for assisting young adults in self-help counseling.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3052-3053.

5228. **Carter, Bryan D.** (White Sands Missile Range, Mental Health Clinic, NM) **School mental health consultation: A clinical social work interventive technique.** *Clinical Social Work Journal*, 1975(Fal), Vol 3(3), 201-210.—Describes the process of providing mental health consultation. Defined as the provision of indirect services by a mental health professional to a broad variety of community caretakers, consultation in the school is the focus of discussion. Steps in the process are elaborated, with attention to the role of the consultee. The importance of preparing social workers to be effective mental health consultants is stressed. (27 ref) —*S. R. Stein.*

5229. **Committee on Revision of the CWLA Standards for Foster Family Service.** *Child Welfare League of America standards for foster family service.* (Rev ed). New York, NY: Child Welfare League of America, 1975. ix, 125 p.

5230. **Feldman, Yonata.** **Listening and understanding.** *Clinical Social Work Journal*, 1975(Sum), Vol 3(2), 85-89.—Uses case examples to illustrate obstacles that get in

the way of a worker's hearing what a client has to say. It is pointed out that personal analysis or therapeutic help is sometimes needed by social workers so that they can learn to empathize with and tolerate disturbing feelings toward patients.

5231. **Golan, Naomi.** (U Haifa, Israel) **Wife to widow to woman.** *Social Work*, 1975(Sep), Vol 20(5), 369-374.—Reviews the experiences of war widows in Israel. The stages of grief are described, and a model is presented to help the widow cope with the emotional and concrete tasks of bereavement and consider her future as a woman. Implications for the professional caregiver are noted, focusing on the personal relationship established with the widow during the crucial transitional stages following the husband's death. The special assistance of Israeli social institutions in helping the widow adjust and rebuild is described. (16 ref)—*Journal abstract.*

5232. **Lewis, Ronald G. & Man Keung Ho.** (U Oklahoma, School of Education) **Social work with native Americans.** *Social Work*, 1975(Sep), Vol 20(5), 379-382.—Attributes the ineffectiveness of social workers in dealing with native Americans to the methods and techniques used. Native American traits and their implication for social work practice are discussed.

5233. **Lindsey, James D.** (Northwestern U) **Reflective inquiry into the social construction of mental illness by hospitalized adolescents.** *Dissertation Abstracts International*, 1973(Dec), Vol 34(6-A), 3547-3548.

5234. **Pasquariella, Bernard G. & Wishik, Samuel M.** (Columbia U, Inst for the Study of Human Reproduction) **Evaluating training effectiveness and trainee achievement: Methodology for measurement of changes in levels of cognitive competence.** *Manuals for Evaluation of Family Planning & Population Programs*, 1975, No 8, 195 p.—Provides step-by-step guidelines for conducting an evaluation of a structured training sequence. The assessment design involves pre- and posttests. Topics discussed include the construction of the test instrument, its administration, and verification of its accuracy. The comparative analysis of the 2 administrations of the test is described so that it can be done either manually or by computer. (23 ref)—*R. Tomasko.*

5235. **Pawlak, Edward J.** (U Tennessee, School of Social Work) **Use of vehicles with client groups.** *Clinical Social Work Journal*, 1975(Sum), Vol 3(2), 109-119.—Describes practitioners' experiences with acting-out children and youth and the considerations that need to be made when using vehicles with client groups. Maladaptive behavior in vehicles is described, and strategies of intervention are suggested to modify such behavior.

5236. **Placek, Paul J.** (US HEW, Public Health Service, National Ctr for Health Statistics, Rockville, MD) **Welfare workers as family planning change agents and the perennial problem of heterophily with welfare clients.** *Journal of Applied Behavioral Science*, 1975(Jul-Sep), Vol 11(3), 298-316.—Uses 2 concepts from E. Rogers (1971), heterophily (i.e., the degree to which individuals who interact are different in certain attributes) and the role of change agents to explain problems which welfare workers have in being influential family planning change agents for welfare mothers. Interviews with 58 welfare workers and 300 welfare

mothers reveal that heterotypic characteristics are 2 groups in social and demographic characteristics, control attitudes, family size norms, and attitudes and that heterotypic may partially account for welfare workers' limited conformity to the change agent role in family planning counseling. (62 ref)

5237. **Prins, Herschel** (Cleveland U. School of Social Work) **A danger to themselves and to others: Social workers and potentially dangerous clients.** *British Journal of Social Work*, 1978(XVI), Vol 5(3), 29-40.

Presents an account of a small group of offender patients defined as dangerous or potentially dangerous. Possible reasons for an apparent reluctance to work with such clients and the unease that often occurs when so doing are discussed. It is suggested that an approach may be required which differs in some respects from more traditional modes of treatment. Emphasis is placed upon the need for careful observation of material facts and events in the lives of such clients in addition to careful observation of the manifestations of feelings and attitudes which may give premonition of dangerous or potentially dangerous behavior. (32 ref) *Journal abstract*

5238. **Schultz, LeRoy G.** (West Virginia U. School of Social Work) **A survey of social workers' attitudes and use of body and sex psychotherapies.** *Clinical Social Work Journal*, 1975(Sum), Vol 3(2), 90-99.—A 26-item questionnaire designed to elicit attitudes toward and practice with body and sex therapy was mailed to 200 social workers randomly selected from the 1972 *Directory of Social Workers*. Within a 60-day cut-off period, 60 usable questionnaires were returned. Results reveal that a majority (60.9%) of the respondents approved of the use of body therapy, but less than half (44.9%) approved of the use of sex therapy. A large majority did not report using sex therapy, and only a quarter used body therapy. The importance of reevaluating the profession's theoretical and treatment values and of establishing ethical standards and review procedures is stressed. (51 ref)—S. R. Stein.

5239. **Tessler, Richard C. & Polansky, Norman A.** (U Massachusetts, Amherst) **Perceived similarity: A paradox in interviewing.** *Social Work*, 1975(Sep), Vol 20(5), 359-363.—Studied the assumption that a client will be more verbally accessible if he thinks his interviewer is like himself. 96 paid female university students role played an interview with a counselor after completing a questionnaire and a "ways-to-live" scale designed to provide a basis for the manipulation of value similarity. Results indicate that similarity between counselor and S elicited more favorable relationship-centered judgments, though the condition of dissimilarity led to greater verbal accessibility.—R. Tomasko.

5240. **Weinbach, Robert W.** (U South Carolina, Coll of Social Work, Columbia) **Case management of child abuse.** *Social Work*, 1975(Sep), Vol 20(5), 396-397.—Discusses problems related to the identification of child abuse cases, procedural ambiguity in dealing with them, and the lack of relevant treatment and central registries. The coordinating role of the medical social worker is noted.

5241. **Wodarski, John S.** (U Tennessee, School of Social Work) **Use of videotapes in social work.** *Clinical*

Social Work Journal, 1975(Sum), Vol 3(2), 120-127.

Discusses the use of videotapes in social work practice. Many factors are considered, including the advantages and disadvantages of videotaping, the ethical considerations, staff concerns, and potential benefits.

5242. **Young, Alma L., Berkman, Barbara & Rehr, Helen** (M. S. S. S. of Medicine, Coll U. N. Y., N. Y.) **Parental influence on pregnant adolescents.** *Social Work*, 1975(Sep), Vol 20(5), 371-374.—Selected aspects of the mother-daughter relationship focusing on stress patterns in the adolescent's plan for herself and her baby and the influence of the adolescent mother. 48 pregnant adolescent girls and their mothers were interviewed. The mother's influence on such arrangements as the baby, education, conception, and contraception is described. Implications of the overwhelming influence of the mother for the inclusion of the parents of the pregnant adolescent in counseling sessions are made.—R. Tomasko.

Hospital Programs & Institutionalization

5243. **Akhurst, Bertram A.** **The prevalence of behaviour problems among children in care.** *Educational Research*, 1975(Feb), Vol 17(2), 137-142.—Used the scales of M. Rutter (1970) to assess the level of behavior disorders reported by houseparents and teachers in a group of 182 children aged 9-10 and 13-14 yrs undergoing long-term residential care in 62 children's homes run by local authorities and voluntary bodies. The percentage of Ss scoring above cut-off point for maladjustment was significantly higher than that for comparison groups drawn from the classes attended by the children in care and that found in previous studies of the general child population. Possible implications of diagnostic groupings, patterns of reporting, and child care variables are discussed. *Journal abstract*

5244. **Birley, J. L.** (Inst of Psychiatry, London, England) **A housing association for psychiatric patients.** *Psychiatric Quarterly*, 1974, Vol 48(4), 568-571.—Discusses the potential functions of a supportive network to help psychiatric patients outside the hospital. The dangers of the network producing dependent patients, or limiting or denying them opportunities, are considered. The use of the principle of the minimum therapeutic dose required is suggested, and the functioning of an association to provide accommodations for psychiatric patients is described. This program's experience suggests that people with a precarious psychiatric and social adjustment are helped by nonresidential supervision.—R. Tomasko.

5245. **Blindert, H. Dieter.** (Behavior Clinic, CPRI, London, Canada) **Interactions between residents and staff: A qualitative investigation of an institutional setting for retarded children.** *Mental Retardation*, 1975(Oct), Vol 13(5), 38-40.—Reports on an investigation of types of interactions occurring between retarded individuals and staff, and frequency of occurrence per type. Results indicate that the setting did not provide sufficient occasions for learning.

5246. **Butlin, Eric.** **Institutionalization, management structure and therapy in residential work with emotionally disturbed children.** *British Journal of Social*

Work, 1975(Aut), Vol 5(3), 283-295.—Discusses the term institutionalization and attempts to define it. Residential social work is discussed based on the premise that it must be treatment-oriented if it is to avoid the pitfalls of institutionalization. The need for treatment to be contained within a flexible management structure is explored in detail, and 5 criteria for the running of a therapeutic residential unit are outlined. Practical applications of the theoretical points are discussed.—*Journal abstract*.

5247. Clark, Bruce A.; Wade, Michael G.; Massey, Benjamin H. & Van Dyke, Richard. (U Missouri, St Louis) **Response of institutionalized geriatric mental patients to a twelve-week program of regular physical therapy.** *Journal of Gerontology*, 1975(Sep), Vol 30(5), 565-573.—23 50-77 yr old geriatric patients from a mental institution were randomly assigned to 3 groups—a social, an exercise, and a control group—for 12 wks. Heart rate at rest, exercise and recovery, balancing ability, total daily activity level (diary method), and a self-care inventory were recorded for analysis. Data were collected at the start, the 8th and 12th wks, and 4 wks after the termination of treatment. A groups \times sex \times measurement period factorial design, using multivariate analysis of variance tested the effect of the 3 factors. The trials effect was significant, as were several univariate tests for the sex effect and group by sex interaction. Data are discussed in terms of programmed physical activity for geriatrics, its value, and the limitations of evaluating such behavior in geriatric populations. (43 ref)—*Journal abstract*.

5248. Clarke, Michael; Waller, Jane & Webster, Barbara. (U Leicester, Medical School, England) **The assessment and progress of long-stay and elderly psychiatric patients: The predictive validity of a ward behaviour questionnaire.** *British Journal of Psychiatry*, 1975(Aug), Vol 127, 149-156.—Attempted to validate a behavior rating scale used to predict the likelihood of discharge among elderly and long-stay patients in a psychiatric hospital. 56% were over age 65 yrs, and 48% had a diagnosis of schizophrenia. The scale measured behavior on the ward as rated by nursing staff. The scale was a sensitive predictor of discharge among those with a low score (indicating least disability), except for patients with organic psychoses. However, many patients with low scores were not discharged. In order to improve the scale's use as a screening technique additional information was considered. The significance of the findings is discussed.—*Journal abstract*.

5249. Cuthill, James M. (E Glamorgan General Hosp, Psychiatric Clinic, Pontypridd, England) **Trends in the care of psychiatric patients.** *British Journal of Psychiatry*, 1975(Sep), Vol 127, 265-275.—Presents detailed analysis of the population of a large psychiatric hospital in South Wales. Attempts are made to determine the incidence of chronicity, with its various underlying causes. Details of the current admissions to the hospital from a catchment area where general hospital and psychogeriatric units have been established, and estimates of future bed requirements are examined. The problems of developing a fully comprehensive mental health service are discussed.—*Journal abstract*.

5250. Doherty, Edmund G. (Wayne State U) **Patients referred to extended inpatient treatment or outpatient therapy from a private short-term therapeutic community.** *Community Mental Health Journal*, 1975(Fal), Vol 11(3), 335-340.—Conducted an exploratory, longitudinal, multimethod examination of characteristics of 32 male and 23 female short-term therapeutic community patients. Results suggest that male and female patients receiving recommendations for further extended hospitalization were the relatively younger, more docile, conforming, and good patients who appreciated their hospital experience and the unit. Diagnostic, biographical, and staff ratings were not important predictors of referral patterns.—*Journal abstract*.
